AMERICAN AGRICULTURIST

FIVE YEARS FOR \$3.00 — THREE YEARS FOR \$2.00 — PUBLISHED EVERY OTHER WEEK

We Can . . . PRODUCE But Can We SELL?

By DANIEL DEAN.

PRODUCTION is only the first half of the farmer's job. Profit or loss from his year's work often depends on successful marketing of his produce.

Roughly half the farm income of New York state comes from the sale of milk. An immense amount of money and effort has been spent by government agencies to help dairymen market their product.

We hear talk about the "submerged ten per cent", the poor people in our cities. What about the other half of New York state's farm products, the part which I call the submerged "fifty per cent" because so little has been done to help their sale compared with the work done to help sell milk for dairymen. How about the poultry products that are increasing in volume so fast every year? And how about all the fruits, vegetables, potatoes, hay and the grains? The farmer must sell this half as best he can. Most of it must be sold to "middlemen", who may be grocers, country shippers, truck buyers, city wholesale dealers or chain stores.

I have no quarrel with "middlemen" as such. They perform a necessary service in our present complex civilization and we cannot get along without them. Our big question in marketing is to find the best ways to get along with them.

Few farmers appreciate the advantages that "middlemen" have over them when it comes to bargaining. Each farmer knows how his own hens are laying or how his potatoes yielded, but he has little chance to know by his own efforts what the other 6,000,000 odd farmers of the United States are doing. His judgment is too often biased by what he sees in his own limited section.

Let's use potatoes as an illustration, Long Island had a record crop in 1938. Many fields yielded 500 bushels per acre. Through the fall Long Island potatoes sold at lower prices, considering their high quality, than those of any other section of the country. In 1921 farmers in the drought areas of the Middle West refused to sell their potatoes in early fall at high prices. Later the price broke badly when the

more favored northern states shipped their big crops.

A large share of the very short crops of 1916 and 1919 sold at record prices, \$3.00 to \$4.00 per bushel. But the bumper crops grown in the two World War years, 1917 and 1918 caused heavy losses to growers.

In winter and spring the government makes estimates of acreage and production for the southern new crop. From July 1st to December 1st hundreds of reporters in every state (mainly farmers) send their estimates of acreage planted and crop conditions at the end of each month to their state statistician. He makes out his state estimate and sends it to Washington, where the national estimate is made out about the 11th of the next month. The final estimate of December and the January 1st estimate of remaining stocks appear about the 20th.

I have many friends who sincerely believe that the government estimates work them injury. They honestly think that if the govern-

ment did not publish estimates of the harvested crop they would

have a big advantage over the "middlemen", because they, the farmers, would know the exact size of the crop, while the poor, unsuspecting "middlemen" would

be in such a state of ignorance that the farmers would sell to them at high prices.

They also say that no one can foretell in advance what any crop will yield. With this statement is always coupled the idea that publishing crop estimates drives down prices. My friends say much about how the forecast of a big crop enables the "middlemen" to bear down prices, but they forget to add that the forecast of a short crop equally enables them, the farmers, to raise prices. These statements appear so reasonable to most farmers that there has never been strong support for a modern system of crop estimates.

Few New York state farmers know that the "middlemen" of the (Turn to Page 13)

Radical Labor's March on Farming Must Stop --- See Page 5.

HITS DIGESTION with a BANG!

Barn-fed cows need more than carefully chosen feeds. Nine-tenths of dairy cow failures either occur or have their origin during the barn-fed months of the year. Modern milk production cannot permit a marked drop in milk simply because King Winter rules the weather. Gone are the favorable factors of green pastures, abundant fresh air and exercise. Instead, heavy grains, dry roughage and barn confinement place a terrific strain on digestion and assimilation. Unless every cow is constantly kept at the peak of condition, expensive feed goes to waste, or bodily health is drained, or both. Overworked digestion is the origin of costly cow ailments that make many

fine cows non-productive and sickly.

Kow-Kare, the iron-and-iodine conditioner, is the sensible winter supplement. Added to the feed, it is an active aid in toning up the organs of digestion and assimilation, enabling them to meet unnatural demands with safety. Thousands of farmers have used Kow-Kare for years for cows below par, and find by experience that it pays them big dividends also to KEEP cows well and vigorous—to head off the worries and loss of non-productive animals. The iron, iodine and medicinal herbs of Kow-Kare are full value, time-tested, and really very inexpensive to use. Sick, off-feed, low-yield animals eat up at a ruinous pace the profits from good cows.

FREE COW BOOK

Valuable 32-page illustrated treatise, written by an eminent veterinary authority. Chapters on common cow ailments, with authentic recommendations. New section tells how to home-mix 17 different feed formulas of proven worth. Select the one best fitted to the roughage raised in your own area. Send for your copy today.

Prepare Cows for FRESHENING

The health hazards of "Danger Month" are real and acute—especially to high-yield animals whose organs are geared for high milk production. Kow-Kare treatment for several weeks before, during and after calving is a sensible precaution in every dairy.

Feed dealers, general stores, druggists have Kow-Kare. If sent by mail, large size \$1.25, medium size 65¢, including postage.

CHARLES M. GARDNER

Editor of the National Grange Monthly and High Priest of Demeter of the National Grange.

AT PORTLAND session of the National Grange a decided compliment was paid to former State Master Fred J. Freestone of New York in his election for another term of three years as a member of the executive committee of the national organization. Mr. Freestone has completed six years of very efficient service in that capacity, during which time he has been chairman of the committee. Both Mr. and Mrs. Freestone are recognized leaders in the Grange work of the country, Mrs. Freestone having been very active for many years in promoting the Juvenile work of the nation and filling with rare ability the position of National Juvenile Superintendent.

FIVE NEW Grange Halls were erected in New Jersey during the past 12 months—by Center Grove, Woodstown, Windsor, Flemington, and Sidney Progressive subordinates. Four of the six Granges in Salem county now own their halls and 72 of the 125 Granges in the state meet within their own homes.

TOPSHAM GRANGE in Maine is not only one of the largest subordinates in New England, but one of the liveliest as well. A recent one-night fair netted a profit of \$247.06 and some event of money-raising character is in progress constantly in that community, under Grange direction. Topsham Grange meets every Saturday night in the year, frequently runs an attendance of 300 or upward, and has one of the most complete working organizations in the Pine Tree State.

IN CONNECTICUT at the big celebration which opened the New Middletown-Portland Bridge, Mattabessett Grange of Middletown won third prize for the float it entered in the parade. It was entitled "Crossing the River the Indian Way," and depicted the early transportation method of using a canoe, the latter having been cut out of a large tree. A group of Indians

added "atmosphere" to the float and rarely has a more unique feature been seen in any Connecticut parade.

A NOTEWORTHY New Hampshire event recently celebrated was the 1,000th meeting of Mountain Laurel Grange, which brought together a great host of Patrons at Northwood and carried out a program befitting so important an occasion. Many New England Granges have held more than 1,000 meetings and a goodly number have already celebrated the 65th anniversary of their organization.

IN THE NATIONAL Booster Night program contest among the Granges fourth prize was won by Hebron Grange, No. 111, at Hebron, Connecticut, whose lecturer is Florence M. Jones. Fifth prize went to Castle Creek Grange, No. 1459, in New York, Gladys M. J. Ross, lecturer.

ONE OF THE jolly features of the National Grange session every year is the celebration of the birthday of the Overseer, who is State Master David H. Agans of New Jersey. He is always reminded that he is a year older and the congratulations showered at Portland upon the genial New Jersey leader in Grange affairs were both numerous and hearty. State Master Agans passed the 70th milestone of his life this year, but is just as active and full of vim as ever.

CANNON GRANGE in Connecticut is extensively remodeling its hall by the installation of a \$1500 up-to-date heating system. All sorts of money-raising projects are under way to provide the funds and the young people are exerting their best efforts to make substantial contributions to the undertaking.

THERE WILL BE much interest in learning the number of Golden Sheaf certificates issued to the Grange members of the country during the past 12 months, who have reached the point of 50 years' continuous membership in that organization. All together 375 of these certificates were issued, of which the greater number came into the Eastern part of the country. Maine tops the list with 82, while New York had 63; Massachusetts, 55; Connecticut, 43; New Hampshire, 38; Pennsylvania, 26; Rhode Island, 14; New Jersey, 4. Since the National Grange instituted the custom of awarding such honor recognition to veteran Patrons, the total number of certificates issued is 2615.

"Can't you be more careful where you point that thing?"

The Camera Caught 'em

A PROBLEM. — Old, neglected orchards, harboring insect pests and plant diseases, add greatly to the difficulties of growing quality apples. While a good many old orchards have been cut down, the problem is still with us and will be for years.

• • •

FRESH FRUIT ALL WINTER.—(Right):

The temperature where this picture was taken is 15 degrees below zero. It shows Earl Harding, Albion, N. Y., farmer, taking some frozen food supplies from his community locker in the Growers' Cold Storage company's plant in Waterport, Orleans County. This is the pioneer community cold storage locker plant in Western New York and is immensely popular with the farmers in the area who may butcher when they want to and have fresh meat the year around, to say nothing of fresh strawberries and other delicacies of the garden out of season.

• • •

HOW NOT TO PRUNE.—(Above): Pruning time will soon be here, and this is an excellent illustration of how not to do it. In the first place, this limb should have been removed before it got so big. Then the limb was NOT removed close enough to the trunk, and a cut was NOT made in the under side of the limb first to prevent its splitting. The tree has made a noble but unsuccessful effort to cover the wound with new growth. Due to the split, the wound can never heal and affords a wonderful opportunity for decay organisms to destroy the tree.

• • •

QUALITY.—(Below): Master Robert Taylor, son of Clayton Taylor of Lawtons, N. Y. Mr. Taylor is known chiefly as a breeder of Aberdeen-Angus cattle, but as this picture indicates, he also knows how to grow grapes and boys.

HONEST.—(Below): Where travel is insufficient to justify an attendant, this type of roadside stand may be the answer. Prices are posted and customers drop their money in a cup. This stand took in \$400 one season. Experience with this plan proves that people ARE honest.

State Must Pay Full Abortion Indemnities

ALMOST in despair, a young dairyman told me the other day of his disastrous experience with Bang's Disease. He had spent several years getting a good dairy together, only to have most of it wiped out. "What's the use", said he, "of trying to start again, for how do I know that I won't have the same trouble all over again!"

He and others like him are likely to have trouble again unless the state and the dairymen do more about Bang's Disease than they are doing at present.

A great campaign was fought for years to eradicate TB in dairy cattle, but Bang's disease is causing far more losses than TB ever did. At present, as most dairymen know, New York State has a limited appropriation with which it is doing some scattered individual testing and paying indemnities for condemned cows. One trouble with this limited work is the danger of re-infection. There is not much use in cleaning up abortion in one dairy while it still remains in many neighboring herds.

There is much interest in vaccinating young calves to make them immune against abortion later. It may be practical to employ calf vaccination as one means of controlling abortion, but probably it should not be depended upon alone. We went through all of these same unsatisfactory experiences in the beginning of the campaign to eradicate TB, and the disease was finally conquered only when we went after it good and hard on an area clean-up-as-you-go basis, with a large enough state appropriation to pay an adequate indemnity for every condemned cow. *We must do the same with abortion.*

Let's call with united determination upon the Legislatures of our respective states this winter for an adequate appropriation, and then let us all take our courage in hand and go after this costly disease quick and hard, and get it over with.

Mastitis presents another but a different problem. Mastitis is probably not as serious as abortion, and the milk is probably not dangerous to human health. *However, if inspectors, either of the milk companies or city or state departments of health insist on condemning cattle for mastitis, then dairymen must unite to insist that the state pay adequate indemnities for them.*

We will be glad to have letters on abortion or mastitis giving your experience and views. Let us do some thinking on this subject, and see if we cannot do something about it.

Results from the Milk Agreement

IT IS OF course possible that the same old gang that has kept down milk prices by keeping dairymen divided among themselves for twenty years will succeed in breaking up the Metropolitan Milk Bargaining Agency and in hamstringing the Rogers-Allen Law in New York and stop the marketing agreement in New England.

No one can predict what *will* happen, because they cannot tell whether dairymen have reached a point where they believe their friends or their enemies, and there is always the possibility that foolish or selfish cooperative leaders will get to quarrelling among themselves and ruin everything.

But we can tell what *has* happened, and that is, as a result of some cooperation among dairymen, and especially among dairy cooperatives, we have had better milk prices this fall than have pre-

vailed before in a long, long time. If prices go down those responsible should be held accountable.

Twenty Years a Grange Master

WHAT a testimonial to personal integrity and high qualities of leadership it is when the members of a great organization continue to re-elect a man as their State master for twenty years!

Such is the record of David H. Agans, just re-elected for another term as Master of the New Jersey State Grange.

Congratulations to both the Grange and to Dave!

American Agriculturist Program for Agriculture

STRENUOUS times demand strenuous measures. *American Agriculturist* has never hesitated to get out in front in the battle for agriculture. We are more than ever determined to do that during the coming year, and here are some of the policies that we are going to fight for. Will you join us to preserve your business and your home?

I. A LIVING PRICE FOR FARM PRODUCTS

BY:

1. More and better marketing information.
2. More and better marketing practices.
3. More cooperation.
4. Government marketing agreements where necessary, but strictly supplementary to cooperative and individual effort.
5. Information on better production methods to reduce costs of production.
6. An honest dollar.

II. STOP THE LENGTHENING SHADOW OF GOVERNMENT BY:

1. Less government in business and agriculture.
2. No regimentation.
3. Lower taxes and more economy.
4. More individual initiative and cooperative effort.

III. STOP RADICAL LABOR'S MARCH ON AGRICULTURE BY:

1. Amending the Wagner Act.
2. Arousing public opinion against government support of radical labor activities like those of the C.I.O.

IV. HELP FOLKS TO BE HAPPY

1. Realize that it is as important to *live* as to make a living.

American Agriculturist aims to help folks to be happier and to increase their joy in living by developing appreciation of life, especially of the blessings and compensations of country life.

Too Much Lifting

ONE OF the stumbling blocks to obtaining any accurate market information on many farm commodities has been the different kinds of packages used. Take potatoes, for example. In Upstate New York the sixty pound bushel has always been the standard package. On Long Island it is the 100 pound sack. In Maine it is the 165 pound barrel. Market quotations on one size of package do not mean anything to growers who use another size, so it is good that there has been some standardization toward a hundred pound package for potatoes, and some advance in standardization of packages for other commodities.

The difficulty of the hundred pound container, however, is that it is too heavy for the average man to handle. Too many farmers have hernias or bad backs or some other disorder that comes

from a lifetime of too heavy lifting, particularly after reaching middle age. With all of our modern machinery, little has been done to lighten heavy lifting for farmers. Smaller sized containers all the way along the line for commercial feeds, fertilizers, and for many of the commodities which farmers sell, would add some to the cost of packaging, but would be far offset by the improved health and happiness of thousands of farmers.

The Trip to Summerland

THE WAY the inquiries are pouring in asking about *American Agriculturist* winter trip to California indicates that we are going to have a splendid party. Better get in your reservation. See Page 23 for details, and write for itinerary to Tour Editor, *American Agriculturist*, Savings Bank Building, Ithaca, New York.

Eastman's Chestnut

OLD FRIENDS of E. O. Fippin, formerly professor of soils in the New York State College of Agriculture and now connected with the Tennessee Valley Authority, Knoxville, Tennessee, will be glad to hear of him again. In a recent letter to me he says:

In the nearly 20 years since I left New York, being sometimes in distant sections of the world, I have continued to subscribe to and read the *Agriculturist* and some other New York State publications, and thus keep in touch with the doings in the old stamping ground and with many associates of a former day. There is one section of *American Agriculturist* that I always read with enjoyment, that is Eastman's Chestnuts. The issue that has just come to my desk reminds me once again to send you a story that was related to a group of us by the late Professor George W. Cavanaugh, Agricultural Chemist, and known to many of your readers, as we sat on the library slope of Cornell University one summer day nearly 35 years ago. This story always has made a particular appeal to me, and is one of the few that consistently sticks in my mind:

Pat was a mechanic who worked in a factory on one side of the town and lived on the other side of town. In the evening he would climb into the rear seat of the streetcar, pull out his corn cob pipe and enjoy a smoke on the way home. On this particular evening, as the car progressed uptown, the fore seats filled and finally a lady of stout proportions and evidently vigorous mind, climbed into the far end of Pat's seat. As other passengers pushed her over in the same seat, she finally came to be jammed up close to Pat and his pipe, of which she evidently did not approve. The closer she came to him the more she fidgeted and scowled at Pat. Finally, being no longer able to contain herself, she said in a harsh voice:

"Say! If you were my husband, do you know what I would do to you?"

Pat took a few more puffs, and in a quiet, contemplative mood, replied:

"No, Madam, what would you do?"

This exasperated the lady the more, and she finally hissed,

"I'd give you poison."

Pat took several more puffs, blew smoke rings and contemplated some more, and finally said:

"And Madam! If you was my wife, do **you** know what I would do?"

Still more exasperated she exploded:

"And what would you do?"

Pat puffed and deliberated some more and finally said:

"Madam! I'd take it!"

Radical Labor's March on Farming MUST STOP

Aroused Farmers Ask, "What Can Be Done?"

AS I WRITE this, France has come through one of the greatest crises in her history, a crisis to determine whether organized labor should run the government and the country, or whether France should continue to be governed, as at present, as a Republic representing all of the French people.

In protest against certain government acts, the French Confederation of Labor called a general walkout of all its members. Not all union members responded, but enough did so that if allowed to continue all business would have been completely paralyzed. Acting promptly, the government called out the army and broke the strike, thus winning a tremendous victory for real democracy.

We may face such a situation in this country, and if present government partiality toward labor continues it may not end as it did in France. Read the letters that have come pouring in from farmers on the subject of radical labor activity as it has and may affect agriculture, then sign, and get your neighbors to sign, the petition printed on this page. The letters follow:

It Would Mean Ruin for Farmers

"I was very much impressed by your article. Unless farmers do something to counteract the movement to organize the farmers and the farm employees, it means the ruination of the farmers. While the Wagner Act is supposed to exclude farms, farmers and farm employees, there is not one person in the C.I.O. organization who is responsible for anything they say. Anything that they want is law and anything we want is just another item of disobedience to the Wagner Act.

"I want to congratulate you on the article that you have written, and certainly any person in his right mind will be able to see what any radical labor movement means to them if it is not entirely wiped out."—C. A. M., N. Y.

St. Lawrence Grange to Act

"Richville Grange, No. 942, is with you solid in the opposition to the Wagner Act. Last night the Legislative Committee, of which I happen to be chairman, was instructed to draft Resolutions to present to St. Lawrence County Pomona Grange. Now, if you have a form you would recommend, please send same to me."—C. V. White, Richville, N. Y.

(EDITOR'S NOTE: The petition on this page, either in the suggested form or in the form of a resolution, should be adopted by subordinate and Pomona granges and carried to every State Grange in the

Northeast this winter. Farm Bureaus and other local organizations should take up the matter and pass resolutions. These petitions and resolutions can then either be sent to *American Agriculturist* and we will present them to Congress, or you can send them direct to your Congressmen. Let's go to work!)

* * *

Offers \$100 to Help

"I am anxious to help if anything can be done to stop this movement. I am wondering if the farmers as a whole throughout the United States are aware of what is going on. I am willing to go in with others that feel as I do as to the attitude of the government as well as the C.I.O. and fight this out. The government seems to

ignore the farmers when the C.I.O. is in question. If you can mass any concerted effort to throttle this movement, you may ask me for my check for \$100 any time."—H. L. B., N. Y.

(EDITOR'S NOTE: That is the kind of support that counts, but we wrote H. L. B. that we do not need money. We need the help of all farmers and their organizations, as suggested in the petition printed on this page.)

* * *

No Six Hour Day for Farmers

"We wish to express our appreciation of your article on the labor situation from the farmer's viewpoint. It should awaken all of us to the menace of C.I.O. The independence which W.P.A. and other governmental move-

ments have produced in the average farm help quickly leads to desire for more and more wages which the farmer cannot pay. But they said 'gimme' and the government gave. They could say 'gimme a six-hour day' to the farmer, and the farmer would have to yield.

"Many local women earn an extra bit by crocheting or glove making. I understand the enforcement of the Wage and Hour law may do away with this. It would mean hardship for many families. Yet they didn't fight it before because they didn't know and were not organized."—H. F. H. and wife, N. Y.

* * *

Do Something Besides Talk

"I back your stand on this C.I.O. question 100 per cent. I believe that we farmers in the Northeast should do something about it besides talk before all the standards set up by our forefathers are destroyed."—R. M., N. Y.

(EDITOR'S NOTE: How to do it is suggested in the petition on this page.)

* * *

COULD Happen in New England

"Although our experience does not include any episode parallel to the ones which you mention, we realize their potentialities and the possibility that they might occur here in New England. Kindly keep us informed as to how we may help."—D. S. K., N. H.

* * *

Resolution for Maine State Grange

"Was very much impressed by your article 'It Can Happen Here.' I believe a resolution along this line should be presented at the next session of the Maine State Grange, and would be glad to speak on its behalf. I would welcome any suggestions from you."—G. H. H., Maine.

(EDITOR'S NOTE: A suggestion for Granges and other organizations is contained in the petition printed on this page.)

* * *

From the Opposition

"It might be a good thing if farm labor were unionized. It doesn't do any good to glut the market with products of sweatshop labor. If farm labor had a minimum wage, there would be more chance for the working farmer to get at least that much for his own efforts. Senator Wagner's re-election in the face of Republican successes does not argue for the repeal of the Wagner Act.

"So I think you may as well call off your crusade. It will not get you anywhere."—R. G. P., N. Y.

(EDITOR'S NOTE: If farmers want walking delegates to tell them when they can hire and fire even their day help, or to tell the farmer himself that he must join the union and pay dues before his products will be handled, it is all right with me. But there is absolutely no way by which a farmer can pass on additional costs of labor to the consumer, as industry can.

Senator Wagner was re-elected in a state where the vote from the great cities is overwhelming.)

GET THIS PETITION SIGNED

TO MEMBERS OF CONGRESS:

We, the undersigned, farmers and small town business men of the Northeast, through the medium of *American Agriculturist*, respectfully request that the National Labor Relations Act, usually known as the Wagner Act, be amended or revised so as to provide or insure the following:

1. More definite and positive exemption from its provisions of farming and of all the other closely allied enterprises of agriculture.

Most farm products are perishable, and therefore a strike in a canning factory, packing plant, or on the farm itself is ruinous to farmers, whose products rot while the strike is being negotiated. Also, with the extremely low prices which commonly prevail for farm products relative to the prices of everything which the farmer has to buy, farmers are unable to stand the additional cost of dues demanded by labor organizations, or the cost of unionized hired labor, and they are unable to pass those costs on to the consumer. Index of farm prices now is about 95 as compared to 100 for pre-war, while the index of city unionized wages is 215. These relatively high unionized wages are already represented in practically everything the farmer buys.

2. The amendment and administration of the Wagner Act so as to provide equal rights to all.

The Act does not so provide nor is it so administered at present. Under present interpretation, nearly everything that labor unions do seems to be approved by government, while everything that employers do seems to be condemned.

Unemployment and relief are America's greatest problems, and we feel that they will continue to be as long as business, particularly small business and agriculture, is burdened with increasing taxes and with unfair, one-sided laws like the Wagner Act.

3. Activities of National Labor Relations Board should be strictly limited to judiciary functions so that in the future it will be impossible for this Board to act, as it has sometimes in the past, as prosecutor, judge and jury.

Name	Address	Congressional District
.....
.....
.....
.....

(NOTE: Paste the above petition on a sheet of paper and attach to it as many blank sheets for signatures as are needed in your community. Sign it yourself, get your neighbor and your friends to sign, and return it not later than February 1, and earlier if possible, to *American Agriculturist*, Box 367-P, Ithaca, New York. If your local Grange, Farm Bureau or business men's organizations approve this, get individual member signatures to this petition and state the name and address of the organization. Paste blank paper to this petition for additional names, or write *American Agriculturist* for printed blanks, which will be furnished free. Return all signatures to this petition and any resolutions passed by your organizations to *American Agriculturist*. We will see that all such protests are submitted to Congress.)

LET YOUR COWS DECIDE! A FREE TRIAL DEMONSTRATION

will prove to you that:

A DE LAVAL MILKER will milk your cows better, faster, cleaner...and is easier to operate and keep clean than any other method.

More Than 60% of All Certified Milk in the U.S.A. Is Produced with De Laval Milkers.

A milking machine is the most important equipment any dairy farmer has to select. The right one will give more profit and pleasure than anything you own.

First consideration is the cows. They must be milked properly, fast and clean. They will give you their answer in unmistakable terms, when you milk them with a De Laval. De Laval Dealers will gladly arrange free trial demonstrations without obligation.

You will also know why a De Laval Milker is simplest and easiest to operate and keep in a clean and sanitary condition, after you have used one.

There must be a reason why more De Laval Milkers are used the world over than any other kind, to milk the world's best cows, many of which have championship production records.

Try a De Laval. If you do not know the name of your nearest De Laval Dealer, write nearest office below.

THE DE LAVAL SEPARATOR COMPANY
New York 165 Broadway Chicago 427 Randolph St. San Francisco 61 Beale St.

INTERESTING CONTESTS

See your De Laval Dealer for instructions and entry blanks for these interesting De Laval Contests. You do not need to be a De Laval user to enter. You may win a substantial cash prize. Get entry blank from local dealer.

A GIFT FOR EVERYONE: In addition, every qualified entrant will be sent a free copy of the famous pocket-size De Laval Diary and Farmer's Handbook as soon as entry is received at De Laval office. It has 146 pages of farm information and a large section for notes.

\$3000.00
IN 100
CASH PRIZES

DE LAVAL — World's Best Separators

For 61 years the name De Laval has stood for the best in cream separators. They skim cleaner, run easier, last longer, produce cream of better quality, and are easier to clean and wash than any others.

There are three complete series of De Laval Separators, providing sizes, styles, prices and terms for every need and purse. They can be bought on such easy terms that they pay for themselves while being used. De Laval Dealers will gladly supply free trial demonstration.

One Crop

By ED. W. MITCHELL

I AM a one crop farmer, and hope to keep on growing one crop — apples. Nevertheless I sometimes doubt the wisdom of a type of farming that specializes on just one crop. These days there are a good many converts to diversified farming. The apple men had storms this year that took much of the

Ed. W. Mitchell

crop and some of the trees. Last year we all took a nice sleigh ride on a low market that turned out to be an endless down hill glide. In 1934 a bad combination of winter weather gave us a thorough house-cleaning that wiped out millions of fruit trees in the Northeast. I can look

back over a long series of similar licks that should be enough to convert almost any one to diversification.

It is pretty hard to say just what it costs to grow a bearing orchard or what it is worth. I lost a bearing Baldwin orchard in 1917, another in 1927, and two more in 1934-5. The capital loss has, I think, finally weaned me away from planting Baldwins. How much beating it will take to wean me away from apples as my only crop the future will unfold, but I am pretty stubborn. Apparently most fruit growers are, or there would not be so many of them.

The farmers who rely on cotton, wheat, potatoes or any one crop are in much the same class. They figure on laying aside a reserve in the good years to carry them over the bad ones. The reserve usually goes to pay up overdue accounts, buy a new car or farm equipment, or it disappears into permanent, non liquid improvements. In bad years the reserves are not much in evidence.

I think that we farmers agree with the experts who like to advise Agriculture that diversification is at least part of the answer. There are only two or three main objections to doing it.

First, each fellow feels he has land, equipment and training to grow his one crop to better advantage than he can any other; secondly, what crop or farm enterprise can you choose that offers any more hope of a profit; and thirdly, why waste time trying to make any one change from doing what he wants to do. We are apple growers because we like to grow apples.

Our experiment stations and colleges have encouraged planting plums, pears, cherries and grapes as a diversification within the fruit business. Some even take a turn at the berry business. This sounds good in theory, but as I move around the farms, I notice all of these are abandoned as soon as bearing apples are secured. From my own experience none of them have been as profitable as apples.

In the Hudson Valley, a great many apple growers have tried sweet corn, tomatoes and other truck crops to help tide over the lean years. None of these substitutes has been much of a success. The net profits in the garden truck business are hard to find and hold on to. The professional truck gardeners seem to do pretty well at it, but as a side line to apple growing, it seldom pans out well.

I have a hunch that there will be a big apple crop in this country next year, and that from that time on, we are going to have a harder time mak-

ing apples show a net profit, than we have ever had in the past. Only good varieties, well packed will be acceptable on the big city markets. Off grades and varieties will move only at low prices. Cider and other by-products will hardly pay the cost of picking them up and trucking to the mill. Their only chance is the development of new apple products or a cheaper distribution system for the mass of poor people in the big cities.

If we fruit growers are going to work at anything besides growing apples, we might well concentrate on those two items, new apple products and cheaper and better distribution to the poorer classes.

Visiting Western Farmers

After leaving the Grange convention at Portland I went down to California and spent a few days visiting farm leaders in the Northwest. In general, I found men very much like our own progressive growers in the Northeast. They are much interested in what we are doing, or trying to do. In meeting with a number of them I have been able to correct some wrong impressions.

I spent a day with the United Dairymen's Association and found it strange that the members are interested in a manufactured milk market and not so much in the fluid market. The United is an outstanding example of how dairymen may profit by cooperation. W. J. Knutzen, president, told me that eight years ago the association borrowed \$900,000 to buy its own plant for manufacturing and now has paid all but \$100,000. Dairymen receive the market price for their butterfat, less 1/4 cent pound commission and the association annually has returned about 76 per cent of this.

At Portland the Dairy Cooperative Association is doing a fine job of marketing milk for Oregon producers. There is a protected market under the Oregon milk control law and no differential between retail store sales and home deliveries. In Washington the state milk control law was declared unconstitutional, so United hired Dr. Robert Prior as co-ordinator. A visit with him and his associates is illuminating.

I made no attempt to talk politics to people I met, but preferred to let them talk while I listened. Yet in almost every case, from California up through Oregon and Washington, I found farmers honestly dissatisfied with farm programs and government aid to agriculture. Most of them admitted frankly enough that the administration meant well enough, but that the more they got of farm programs the worse off agriculture appeared to be. In other words, in these coast states with their diversified and specialized crops, they don't believe anyone can or should regulate them except themselves and the weather.—Skeff.

"GUESS I FORGOT TO
SOW THE SEEDS I HAD IN
MY POCKET, MAW"

The first plow used in what is now the town of Bergen, in Genesee County, N. Y. It is housed in the Historical Museum at Batavia, a structure built in 1815 and used until 1837 as headquarters for the Holland Land Company while it disposed of some 3½ million acres of new land in western New York.

A Straight Furrow to HOME and INDEPENDENCE

THE FIRST time Michael McEntee's farm changed hands for cash, it brought 30 cents an acre. Not only his farm, but 3½ million acres sold for that price—the whole western end of New York State, wild and untouched.

New land was the call of that day, and among the first settlers was William Nichol. He too brought his plow, strapped to a lumbering wagon. He chose a site in Oak Openings, northwest of what is now Oakfield, New York. There he cut the timber and broke the sod. His wife cooked in an open fireplace.

William lived 50 years in the Openings—50 years that included many a tough season, many a set-back and discouragement. But when he died in 1870 he left to his eight children a 175-acre farm that one of his boys promptly took over for \$17,000. That was right after the Civil War and western New York had become a granary of the Nation. Land that had brought 30 cents an acre 70-odd years earlier was now growing \$2 barley. In Nichol's lifetime, his land and his hard work gave him a home and independence.

* * *

Nearly seventy more years have passed. The Nichol farm is now the McEntee farm. New faces at the door, new voices in the hall. New hands for today's tasks. The fields now grow alfalfa and pedigreed potatoes—the barns house a commercial flock of hens and a herd of Guernsey cows.

The old house has modern plumbing and electric lights. A boy goes to college. Change, yes—but unchanged is the faithful land, honest and enduring. It still turns out 40 bushels of wheat to the acre.

The McEntees didn't always have so nice a place. They started from scratch; until three years ago they were renters. They know the sting of a tough season and discouragement. With hard work and good management they are tackling the job of winning their own independence.

For safety, they diversify their crops and livestock. For economy, they do most of the work themselves. Success for them means just what it did for William Nichol a century ago—home, opportunity, and the respect of good neighbors.

* * *

Every community of the Northeast has its McEntees. Men and women who are making their own way, like the earlier pioneers—on good sense, hard work, and fair play. Here in the Northeast they may choose among many ways of farming. Here are markets and industrial wealth—people to buy and use what we produce for them.

Best of all, today's generation has a heritage that only time can bring—the heritage of things that endure—the heritage of long years that have made the Northeast a better place to live.

Successive generations altered and improved this old farm home during the 100 years that it was in the Nichols family. It is now owned by Michael and Florence McEntee who bought it three years ago.

This is one of a series of articles published as
AN EXPRESSION OF CONFIDENCE
IN NORTHEASTERN AGRICULTURE

* * *

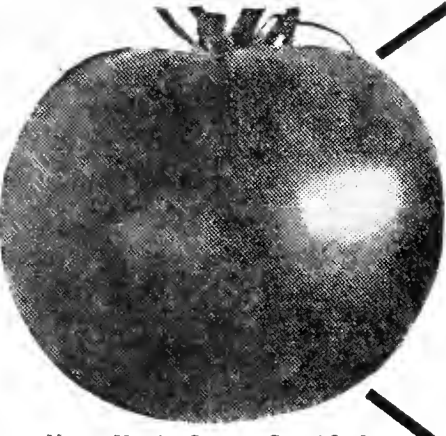

About half the farms of the Northeast are owned free and clear. They have earned their independence. The others are mortgaged; and the greatest risk to their owners is the chance of losing what progress they have made.

For some 30,000 farmers of New England, New York, and New Jersey, the Federal Land Bank is providing a type of mortgage financing that gives the greater degree of safety. Land Bank mortgages require only small payments in any one year; they provide for a long time to pay out, if it is needed; they don't come due in a lump sum and therefore don't have to be renewed.

"Safe Financing" is the name of a folder that describes these farm mortgages in detail. You may have a copy free.

Gardens in ICE

Quick freezing enables farm homes to have fresh fruit in winter as well as summer.

By J. J. SUGDEN

A FRIEND of mine once asked me if I had a hobby. My answer was, "Yes, agriculture is my hobby as well as my business." My friend was a city man, and the look he gave me indicated he thought my poor taste was perhaps equalled only by my poor mentality. He quickly turned the conversation into other channels. Anything relating to agriculture has always been of the greatest interest to me, and that might explain why I get a lot of fun every spring, summer and fall from my backyard garden. In fact, it was willingness on my part to prolong this pleasure that first aroused my interest in frozen fruits and vegetables. And for a hobby that will return big dividends in a financial way, as well as in good health and enjoyment in good things to eat, I earnestly recommend all my farm and village friends to investigate their own possibilities for packing frozen fruits and vegetables produced on their own farms.

Two years ago we put our own fresh strawberries into a refrigerated locker. Boy, how good those fresh strawberries tasted all winter! How our friends would question us as to where we bought such delicious fruit at that time of year, so ripe, such fine color, so full of fresh flavor! And our own enjoyment was keener because we knew we were not paying an enormous price for the pleasure of having fresh strawberries on our table out of season.

After this first experience we naturally became enthusiastic, and gave the subject of frozen fruits and vegetables some careful investigation. I did a lot of questioning of many people, mostly farmers, who were using private refrigerated lockers in which to store fruits, vegetables, fowl and other farm products. I found them all enthusiastic, but all using almost as many different methods of packing, grading and variety of fruits and vegetables they were freezing as there were people. That year we packed sour cherries as well as strawberries. And when we added fresh cherry pie to our menu all winter, along with strawberry shortcake and fresh strawberry desserts, we felt well repaid for our careful investigation of the methods used, varieties of fruits to freeze, types of containers in which to pack, and other small details of locker freezing for individual families.

This third season we are using what

we call our full time program because our past experience shows us this is the most economical way in which to use our locker space. The first thing we froze this year was rhubarb from our garden this past spring. Next came strawberries, followed by raspberries, wax beans and cherries. We have just finished (the middle of November) with carrots and beets, freshly dug from our garden during the week. Next year we hope to freeze sweet corn, lima beans and muskmelons, in addition to the things we are now packing.

We have found a few simple rules necessary if you want to serve on your table during the winter months all the wonderful flavor and color of freshly picked fruits or freshly dug vegetables.

Worth Investigating

WHEN farming became a specialized business and each farm produced only one or two specialties, then farm life lost something fine in the art of living.

We still must specialize. Some farms will produce milk, others poultry, and others potatoes. But now with modern refrigeration it is possible to enrich the living and the happiness on farms by making the farm produce more of our own living. Mr. Sugden, in the interesting article on this page, tells how he does it. Why not look into the possibilities of organizing a refrigerated locker system in your neighborhood?

- 1—Use only fruits and vegetables that have been allowed to mature fully on the vine or tree—never slightly green, nor beyond their bloom.
- 2—Freeze them fresh, preferably the day they are gathered.
- 3—Sterilize all containers before packing.
- 4—Select those varieties of fruits or vegetables that experience shows are adapted to quick freezing.
- 5—Avoid adding anything except sugar in the case of fruits. (A lot of my good friends use syrups of sugar and water and do a good job, but we are convinced that natural juices are the only moisture that should be frozen in.)
- 6—Allow article taken from your locker to thaw gradually before using. (We keep a week's supply on hand in our kitchen refrigerator all the time, and have found that flavor and color is retained this way for as high as two and three weeks time. Of course, it is at its best when eaten or used fresh as soon as thawed out.)

Any farm family living near a community refrigerated locker can now serve on their table all the year 'round the choicest fresh fruits and vegetables, fresh beef and poultry meat, which have heretofore been available only to the family of Mrs. Money Goldrocks, and at prices that would make Mrs. Goldrocks green with envy.

Agriculture here in the northeast is going to require more attention in the future to actual family subsistence from their own land, I believe, and here is one way in which many farm families, as well as village folks, can help themselves in this desired direction.

Gooseberries

—a neglected fruit

By GEORGE L. SLATE

THE gooseberry is a fruit whose merits for the home garden are not fully appreciated and in recent years its culture has been on the wane. The ease of culture, the small amount of space occupied by the few plants needed for family use and the delicious culinary preparations which may be made from them invite consideration. They may be grown in shady corners on the north side of fences or buildings or among fruit trees thus permitting complete utilization of a limited garden area. The plants are hardy, diseases and pests may be controlled readily and heavy annual crops are the rule. Every farm fruit garden should have half a dozen gooseberry bushes.

The best soil for gooseberries is a cool, moist, well-drained clay loam, but they will thrive on the lighter types if well supplied with organic matter. They are not happy on light sandy types or hot locations. Gooseberries respond well to heavy manuring and liberal amounts should be worked into the soil before the plants are set.

Fall planting is best as gooseberries start growth very early in the spring, but early spring planting will do. Late spring plantings are likely to fail if the weather is hot and dry. The plants should be set about 5 feet apart each way.

The weeds may be kept down by occasional cultivation which should be shallow as gooseberries are shallow rooted. Better yet, a mulch of strawy manure, grain straw, old hay or even weeds may be used to control weeds and conserve moisture. Liberal applica-

tions of farm manure occasionally supplemented by a fertilizer high in potash will take care of the plant food needs of the gooseberries. Lacking manure, a good mulch and an early spring application of one quarter pound of a high grade complete fertilizer will keep them growing.

Pruning consists of removing canes over three years old, prostrate canes, and thinning the remainder to six or eight strong shoots.

Green gooseberries are useful for pies and sauce, being ready for that purpose during the latter part of June. The bushes may be picked over two or three times, the earlier thinning allowing the later fruit to become much larger. The ripe fruit of a fine flavored variety like the Poorman is fine for eating out of hand as a dessert fruit. The red fruited sorts make a jelly nearly equal to that made from currants. Gooseberry jam is also fine.

Poorman is the best variety, being large-fruited, red and of excellent quality. Chautauqua is a large-fruited green variety of the English type and is the best of its class. Downing is the commonest variety listed by nurseries, and is good although the berries are small. A small-fruited red variety is Josselyn or Red-Jacket.

Mice Cause Serious Damage to Orchards of the Northeast

By W. H. THIES,

Massachusetts State College of Agriculture.

DAMAGE caused by meadow mice and pine mice in the orchards of the Northeast amounts each year to many thousands of dollars. A few simple precautionary measures would tend to prevent much of this loss. When fruit trees are planted, some measure of protection is offered by the use of a guard made from quarter-inch mesh screening. Many growers have had the experience of finding severe girdling even where guards were used. This situation is likely to exist where the trees have partially outgrown the guards, and especially where the lower edge does not extend well into the soil. Perhaps the average grower places too much reliance in the guard itself, and assumes that a guard once in place will solve the problem for years to come. This brings up the question of other measures to prevent the depredations of tree girdling mice.

Recent investigations have brought to light some interesting facts which bear upon this problem. The meadow

mouse is found only where there is a comparatively heavy grass cover. This animal is a grass feeder. Its "runs" will therefore be found only where grass is abundant. And if grass is allowed to grow unhindered around the base of the tree we thus provide the needed encouragement for bringing mice into dangerous proximity. There is reason to believe that the annual removal of all grass and weeds from within about 18 inches of the trunk is well worth while. Incidentally, if every orchardist were to follow that procedure, injured trees would not escape detection so long as is now the case. For in the process of cleaning up an area around each tree trunk, we expose that portion of the tree most often injured by mice.

Another very effective means of reducing the mouse population in the orchard, if not actually exterminating them, is the placing of a suitable poisoned bait directly in the "runs" instead of in bait stations. Recent tests along this line with materials other than strychnine have focused attention on one of the phosphorus compounds. The close relationship between a heavy grass cover and the presence of mice is a great aid in combatting this troublesome rodent.

NOW YOU CAN HAVE THE FREEDOM OF POWER FARMING

On Rubber ONLY \$495.00 F.O.B. FACTORY

PLOWING — A-C PICKUP mold-board plow attaches directly to tractor in a few minutes. No wrench needed. Fourteen-inch \$52.00, 16-inch \$54.00 f.o.b.

Fruitful Figures

By C. A. BECKER

THE farm inventory is a good financial record for a farmer to keep. Those who know what a farm inventory is and what it does for them will vouch for that. In many ways a farm inventory is the best financial record to keep—but before we get into the whys of that, let's see what a farm inventory actually is.

Around this time of the year many business houses are taking inventories. Some do it annually; some semi-annually and some monthly. There are still others who have a system called the perpetual inventory so they can tell at the end of each day just what they have on hand. But it is the annual inventory in which we are interested. That inventory serves as a basis for preparing an annual balance sheet—or Statement of Resources and Liabilities as it is often called.

We are all perhaps most familiar with the balance sheets of banks and insurance companies because we often see them published in the newspapers. Recalling one that you have seen in the paper, a balance-sheet probably seems a bit complicated, but if we analyze it we find to the contrary that it is really quite simple; it is merely a list of what is *owned* and what is *owed* with their values. I like to think of a balance sheet as a snapshot of a business at any one time. An inventory of your farm would be just such a snapshot of your farm business. As *Medicago sativa L.* is commonly known as alfalfa, so a balance sheet of a farm business has come to be called a farm inventory.

The farm inventory is the basis of all other financial farm records, but by itself it has many valuable uses. Because of this and because many of us do not care to spend a lot of time keeping records it is the best single accounting record to use. A look at this partial list of what an annual farm inventory will do for you should convince you of that.

1. Show the total value of all your property.
2. Show your net worth above all debts.
3. Show whether you are getting ahead financially, and how much.
4. Serve as a basis for preparing a credit statement.
5. Help plan the year's business.
6. Provide a valuable list of all property in case of emergencies, like fires, or in settling estates when death comes, or for other purposes.

Of all these uses, the fourth is becoming more and more important. Nearly everyone needs credit in one form or another to operate a farm. Some may need it for feed, some for a

tractor, others for cows. For whatever it is needed, the farm inventory will furnish the figures that may make it possible for you to get that credit on a business-like basis from your bank or Production Credit Association and thus save you real money over the high rate of interest usually paid when you charge it with the feed or supply dealers.

A farm inventory is simple to take. After you have decided to take one, get a pencil and paper in hand and merely proceed to list all your property with its values; your land and buildings, your livestock and tools, your feed and supplies, any money that is owed you (notes or mortgages or milk checks), and any cash on hand or in the bank. From the total of these, you deduct the total of all your debts, which will include mortgages, notes and accounts payable. The difference between the total value of all your property and all your debts is your net worth! Completed, it is a picture in writing of your farm business—your farm inventory. Here's how your farm inventory might look:

Farm Inventory of John Carter January 4, 1938		
Resources:		Value
Land and Buildings....		\$10,000
Horses		350
Cattle		2,100
Sheep		300
Hogs		30
Chickens		200
Feed and Crops on hand		420
Miscellaneous supplies		50
Machinery and Equipment		2,200
Fall plowing and winter wheat		75
Notes and Accounts Receivable		150
Cash on hand and in Bank		67
Other personal property		800
Total		\$16,742
Liabilities:		
Farm Mortgage		4,500
Notes and Accounts Payable		102
Net Worth		\$12,140

To make it even easier to do, and because you may be reminded to include some things you might otherwise forget, I suggest that you ask your county agent for a farm inventory book published by your State College of Agriculture. The book may cost a few cents or it may be free but you can be sure the results of the half-day you may spend taking a farm inventory will be valuable.

"Give it more gas, Pop. Believe you budged her that time."

Plain, Every-Day Farmers own and manage THE DAIRYMEN'S LEAGUE

Started as an Agricultural Enterprise—
It has become a *Great Human Endeavor*

What is the Dairymen's League? Where is it located? Who owns it? Who manages it?

The answers are all around you. Your neighbor down the road, over on Route 5, or in the next county; members of your church, of your Farm Bureau, or Grange or Lodge; the fathers of children your children play with at school. These are the people who own and manage the Dairymen's League. *THEY ARE THE DAIRYMEN'S LEAGUE.*

THE VISION

The wise founders of the Dairymen's League had a real vision. They and their fathers before them had seen the futile struggle go on. They had seen the efforts of farmers to organize against the growing power of dealers, thwarted time and again. They had seen dealers' representatives on farmers' boards of directors . . . spies in farmers' meetings. Each—without producers knowing it—playing one group against another, keeping the farmer's price down, the consumer's price up. They saw this **ANTI-FARM GANG** control tightening its sinister grip year by year on the farm business and the farm home.

These pioneers in cooperation had actually experienced much of it, and knew that it was a threat to all dairy farmers. They envisioned in this new organization a plan that would restore to farmers those God-given rights that had gradually been wrested from them. They knew it had to be worked out and run by farmers themselves. No one else could be trusted. They wrote into its constitution and by-laws a provision that the **LEAGUE MUST BE MADE UP OF PLAIN-EVERY-DAY, DIRT FARMERS, WHO MILK COWS.** These farmers must own the League—lock, stock and barrel. They alone—must have full say about money and management. **THAT PROVISION HAS NEVER BEEN CHANGED IN ANY WAY.**

WE, THE MEMBERS, RUN THE DAIRYMEN'S LEAGUE

The plan is simple but very complete. We elect our own board of 24 directors. Every director must be an active League member in good standing. Each district chooses its own nominee. The entire membership ballots individually. Every member has a vote just as you do in your town, or state or national election. The members say to the directors "Take our milk, market it, deduct the cost and

divide the balance among us." It is run just that way—directors reporting back to the membership every year and oftener if emergency conditions justify.

These 24 directors choose 5 men from their own number as a managing committee. They supervise the every-day affairs of the League—carrying out the policies laid down by the membership through the directors. Every important move must have the approval of the directors to whom they are responsible and with whom they meet once a month. These men know farmers and farm families—and they know dealers and milk markets.

HAS THE JOB BEEN WELL DONE?

The job was to build an organization—an institution that would serve the needs of farmers; to market their milk efficiently and at the same time to withstand the assaults of a merciless enemy. Has the job been well done?

For decades dealers owned and controlled the avenues to markets. If we farmers were ever to have any share in this control we must finance our own effort. We could not trust it to others.

WHAT ABOUT THE FINANCIAL SIDE?

A few cents a hundred from billions of pounds of members' milk created the great financial structure of this institution. How well has that been managed?

Certificates of Indebtedness are issued to members to cover this financing. They are due at a certain time and pay regular interest. Some of us members look upon our certificates as savings, others look upon them as investments. But all of us look upon them as the instrument with which to preserve our freedom and our independence in the marketing of our products.

ASK YOUR LEAGUE NEIGHBOR

Has this job been well done? Ask any of your League neighbors. Every penny placed in Dairymen's League Certificates of Indebtedness, whether you call it savings or investment, or a cooperative method of meeting dealers on their own ground, has been repaid dollar for dollar when it was due, much of it before it was due. The League has never

This is one of a series of statements of fact printed in this paper to again set forth what we believe to be the advantages of true cooperative organization for the benefit of the 187,000 readers of the *American Agriculturist*, most of whom are not members of the Dairymen's League. These facts are printed to counteract many misleading statements, to unmask the propaganda of the **ANTI-FARM GANG** as a dastardly assault against all farmer cooperatives and all farmer interests.

defaulted on a single penny of its obligations. We **HAD TO HAVE** this farmer system of financing. It has stood the test of nearly two decades. It has given us the sinews of war in the longest and hardest battle against dealer domination that any group of dairy farmers ever had to undertake.

THESE ARE FACTS NOT THEORIES

These are facts not theories—actual experiences not dreams. League farmers have actually lived with them night and day for twenty years and more.

We Know that:

Farmer ownership of plants has meant control of surplus and stabilization of markets.

Farmer management has meant a sure market the year round and sure pay.

It has meant honest weights and tests.

Farmer management and ownership tied together in organization has given greater collective power to every individual farmer and greater security to every farm home.

*It has created bargaining power, kept the avenues to markets open to farmers and enabled them to stand off the repeated attacks of the **ANTI-FARM GANG**.*

In the next issue of this magazine, we will discuss some of the efforts that have been made to tear down our successful institution.

The **ANTI-FARM GANG** is composed of a group of men who stand on the opposite side of the fence from the farmer because they make their living either by buying from him as cheaply as they can, or by trading upon his distress. They have no direct responsibility either to the farmer or to his welfare. Naturally the Gang has pulled into its company certain individuals who should be on the farmer's side, but who joined in with them to avenge their personal grievances.

We are not referring in any way to those persons and concerns who are fair and just in their dealings. We indict only those who stop at nothing to gain more dollars or more power. These are the men who make up the **ANTI-FARM GANG** and no farmer can ever expect any sympathy, understanding or fair-dealing from them.

Fertilizer? Railroads need it too!

SOMEWHERE around 200 million dollars are spent each year by American farmers for fertilizer.

That is a lot of money when you look at it in total. But it's mighty well spent, when you consider what would happen to the land without it.

Now railroads are something like farm lands. They need "fertilizer" too. They need to have money put back into them, if they are going to keep on giving the finest transportation service in the world.

Even during the past eight years—which were lean ones for railroads—about 2¾ billion dollars have been "ploughed back" into developing better service and more efficient operations. This is over and above the more than 9½ billions spent during the same period for maintenance of roadway and equipment—all of which has made possible faster, safer

and more dependable freight and passenger schedules.

When you look at figures like these, you can see that railroads need more than bare running expenses. Unless they can keep on making improvements, their cost of doing business will go up and their service to farmers and other shippers will go down.

That's why the railroads have worked out a program which calls for such common-sense treatment as this:

Treat the railroads as a business. Give them reasonable freedom to "price" their only product—transportation service. Give them greater freedom to adjust rates to meet competitive situations, to adjust services to the demands of traffic; and to adjust expenses to the condition of their business. And give them equality of treatment and opportunity—equality with other forms of transportation in matters of regulation, taxation, subsidy and the like.

You'll find the whole program interesting. Send for your copy today.

**SAFETY FIRST—
friendliness too!**

Sound Advice

FARM machinery and equipment are up against hard usage and indifferent care. We here at the Massachusetts State Experiment Station have a heated room, 24 ft. by 24 ft., with double doors wide enough to take in a hay rake or fertilizer spreader. Each winter during the time when outside work is slack, we take our various machines into this room, pull them down, clean each part, replace badly worn parts, reassemble and paint all iron with red or blue lead, then paint as they originally came to us (when necessary).

After the machines have been gone over, we take each harness apart and clean thoroughly with warm water and a good soap, let them dry and repair or replace all worn straps. We then soak them with a harness oil; then when the oil is absorbed we wipe them over with a good harness oil soap dressing and then reassemble them. I have found through the years that this is sound practice and saves me much grief in summer operations when time is all important.

To those who say, "Yes, but he has the resources of the State back of him," I say that the only essentials are a good shed well-covered and lined with some good insulating material, a stove in one corner, a vice, a small forge (handy but not absolutely essential), wrenches, hammers, sewing needles and thread and wax. Not a big outlay in money, but an outlay which will bring big interest in efficiency and in satisfaction throughout the years.—C. W. Everson, In charge of outside work at Mass. State Expt. Station.

His First Horse Race

I HAVE trained and raised horses, have broken over 500 colts, and have managed stock farms and riding schools. I had my first horse race back in 1880 when I was 12. In February there was to be a farmers' horse race on the river near my home, and my brother, who was about twice my age, was starting a four-year-old in one class. Our neighbor was racing his best horse in a free-for-all trot. That class was racing for oats. Every man who started a horse bought a bag of oats, and the winner took all.

This neighbor had two boys about my age who came to see the races with a white mare in foal. I got in the sleigh with the boys, and we trailed the free-for-all class up the river, then turned old Nell around. The race was a mile straight-away, and soon they were leaving us far behind. I thought I could get more speed out of old Nell so I took the reins from my schoolmate. I used the whip some, and we came in first.

The boys' father, owner of old Nell, got plenty of roasting and was asked why he drove the wrong horse in the race. Old Nell was 15 that spring and raised a filly that summer.

Two years later I trained some real horses, but never raced any mares in the winter when they were in foal.—C. S., Lisbon, N. Y.

Forty Years Ago

I HAVE many memories of life on the farm as a hired hand, going back to nearly 40 years ago. The way work was done at that time and the way that milk was produced, handled, and marketed, compared to the way it is now, was some different. Because of the distance from the railroad, we used to get up at 3 a. m. to start the milking and to get the milk ready for the team at 5 o'clock to be taken to the railroad station. We used a large covered wagon drawn by four horses, as it was a long journey and took hours to make the trip. Today a truck would make it in much less time. Our driver picked up milk along the way nearly the entire distance. The milk was put up in 8½ quart cans and the wagon body was so constructed that the cans were packed in ice.

I will remember those long hard days the rest of my life. We breakfasted at

six, field work began before seven, continuing through the day with time out for dinner. With chores and supper out of the way, there was sometimes an hour or two more of work to do before going to bed. In those days, I think farmers put in longer days and worked much harder than they do now. The man I worked for raised practically all of the living for the family and the stock on their farm. Today I notice that the farmer buys nearly all of his grain and most of his food stuffs from the merchant. I think that is why some farmers seem to have so hard a time making a living.—E. L. R., New Hampshire.

(EDITOR'S NOTE: Probably E. L. R. is right that farmers do not work such long hours. Also, farm machinery has lightened some of the drudgery of farm and home work. However, in the old days there were more young people on the farms to do the work, and good men could be hired by the day and month much more easily and cheaper than at present. The average age of farmers today is much older than it was even 25 years ago. One of the things to be marvelled at is how these older farmers of today do so much heavy lifting and other hard work.)

How to Get Ice Cream

YOUR STORY of how your brother got his first dish of ice cream by renting out a bee on shares reminds me of my own experience. Once, when I was a little boy, there was something killing Grandma's chickens. She offered me some ice cream if I could catch the guilty party. I did. It was a skunk and I brought it as far as the chicken house door, proved my claim, and got all the ice cream I could eat at one sitting. I was denied the pleasure of killing the skunk, which was turned over to the hired man; but I did strike a bargain with Grandma that I was to have ice cream for every skunk I caught in her chicken house.

I got no more prey during the next few days, but I did evolve the idea that if the skunk won't step in your trap, there is no reason why you can't put the trap on the skunk—especially if you know where the hired man has thrown a perfectly good dead skunk. I put the trap on the dead skunk, hung it on a pole and took it to the house and got my reward. I then determined to find out two limiting factors of the ice cream business, viz. how long you can keep a dead skunk in good, usable condition; and how long tactful salesmanship can avoid close inspection and detection.

I hit on the plan finally of announcing each successful expedition to the henhouse and displaying my skunk only at dusk, always with loud shouts of joy and always with him hanging from the end of a pole. I would hesitate to say how many days or weeks this continued and I waxed fat on ice cream. Suffice to say, I would still be catching skunks in the chicken house and living on ice cream (for I liked the life), except for certain limiting facts over which I had no control. Age and warm weather, together with much handling, wore out my skunk and its condition attracted some suspicious person to its place of concealment. The other factor was Grandma. She finally reached the conclusion that no small boy could catch a full grown skunk every evening, at the same time, from one small chicken house, so she cancelled our contract.—Ed Mitchell, N. Y.

Cracked If You Use Cracked Saw

I WAS TOLD that a crack in a circular saw could be stopped and the saw made safe for further use by the simple method of boring a hole at the end of the crack. I have tried it—and it doesn't work. Would it not be well for you to run a cartoon, featuring the fact that ONLY CRACKED FOLKS USE CRACKED SAWS! It might save some serious mishaps.—P. N. T., N. H.

We Can PRODUCE . . . But Can We SELL? (Continued from Page 1)

United States use, every day, a system of crop estimates that is far more expensive and up-to-date than the government's. Were government estimates abolished, the "middlemen" would have even greater advantage in bargaining with farmers than they have now.

Every large city produce dealer and every large country shipper is daily sending and receiving telephone calls, telegrams and letters in the course of his business of buying and selling produce. Professor Rasmussen's marketing investigations found that the larger produce firms spend thousands of dollars a year. Each dealer uses this opportunity constantly to exchange information with other dealers on the growing and storage conditions of the produce he handles. What the Aroostook County potato shipper phones his New York broker in the morning travels thousands of miles further before night.

On my trips to fifteen states and provinces to see potato growers I meet growers, scientists, dealers, market reporters and farm paper editors. I find that potato dealers are almost always more up to date about crop and storage conditions than any of the others.

For example, two years ago an Aroostook potato dealer telegraphed a big produce firm in California that late blight had suddenly become very bad. Next morning I received a long night letter asking reply by air mail, giving my opinion as to what the effect of this blight would be upon the Maine crop and upon prices later. In less than 48 hours two telegrams and an air mail letter traveled over 10,000 miles. This firm buys in Idaho, Colorado, Washington, Oregon and California and sells from the Pacific Coast to Chicago. It does not handle Maine potatoes, but it must know how potatoes are growing or storing in Maine to know how to buy and sell its own in the Far West. That winter this firm sent me to Aroostook to find how bad rot was in storage. It has sent men in August and September to make private forecasts of the crops from the Red River country to Aroostook.

Farmers should ask themselves this question: "How much money is the government spending each year to help

farmers sell their products compared with the amount to help increase production?" The answer is,—"Very little."

The total cost of the present crop estimate system is \$769,000 per year. The men who do the work are absolutely honest. The estimates are remarkably accurate, but very slow.

Every "middleman" uses the telephone and telegraph. We have a farm bureau system. I propose that each county farm bureau shall telephone representative farmers on the last day of a month, asking crop or storage conditions. Each county report would then go to Washington by code night letter. By using modern office machines such as the Census Bureau uses, crop reports could be released by radio on the first day of each month, within 36 hours after farmers had reported to the farm bureaus.

Another alternative would be to send the night wires to state statistician, as at present, and to have districts of 4 to 6 counties, each in charge of a deputy statistician.

Many perishable fruits and vegetables grown in New York state need production reports twice a month as crops mature. We need to know much more about the storage conditions that so often set the price of a product. For example, late main crop potatoes are kept in storage from October 'till the following June in Maine. We now have but one potato stocks report, that of Jan. 1st.

Many fruit and vegetable producers also need to know how fast canned goods of their product are being used from storage, the same as poultrymen need to know how many eggs are in storage, or dairymen how much butter.

EDITOR'S NOTE: We agree with Mr. Dean that farmers need accurate, complete crop reports at the earliest possible moment. However, there are two cautions that need to be observed. It has seemed to us that at times a bumper crop is considered headline news while reports on short crops receive less publicity. The second thing to watch is the tendency of government departments to make too definite future predictions. We believe that the public should be given the facts and allowed to draw their own conclusions.

From vaudeville star to apple merchant is the story of Miss Dorothy Nertney of Ridge Road, Medina, Orleans County, N. Y., the Jane Stuart of footlight fame. When vaudeville waned some 15 years ago, Miss Nertney realized the ambition of a lifetime to own a fruit farm in the famed Niagara fruit belt. Shipping gift cartons of choice apples to customer mailing lists of big commercial firms, Miss Nertney has developed one of the most unique fruit businesses in the country. "It's a gift," says Miss Nertney, displaying one of her cartons of two dozen Macs, and explaining that she often receives as much for two dozen apples as her fruit-growing colleagues get for a bushel.

It's True What They Say... CASE COSTS LESS TO RUN

Today's Most Economical Tractor At New Low Prices

You only need to run a Case tractor for a few hours to see how it gets more work done. You'll see how it is balanced to get the pull from every pound of its weight and the power from every ounce of fuel. You'll notice how easy it handles, how smoothly it steers, how short it turns with full load. You'll find it just suited to low-cost fuels.

But the big gain you get by using a Case tractor comes only with time — lowest upkeep cost and long life . . . good service years after ordinary tractors are worn out. Owner reports on hundreds of Case tractors 8 to 10 years old show average upkeep only about 1 1/4 cents per working hour. And these same owners declare their tractors are still good for an average of 9 years more!

Go to your Case dealer and see the secrets of Case capacity and long life. See for yourself how the Power-Saving Transmission puts more power to work, reduces friction, saves fuel. See how Positive-Pressure Lubrication and Dust-Sealed Construction make tractor life longer and upkeep lower. Notice especially how Synchronized Steering in Case all-purpose tractors makes row cultivation easier, cleaner, faster. And now you can have all these advantages for less money. Ask your dealer about the new low prices on Case tractors. Mail the coupon today.

When writing advertisers be sure to say that you saw it in THE AMERICAN AGRICULTURIST.

William Kenan, Jr., Randleigh Farm, Lockport, N. Y., recently purchased Sybil Tessie Lorna from Lloyd Hulburt of Oregon. This six-year-old Jersey cow recently completed a 305-day record with 1,020.52 lbs. of butterfat. This is more than her own body weight, a feat equalled by only two other cows.

Barnyard Gossip

THE Pennsylvania Experiment Station reports that a quarter of an udder affected with mastitis averages to produce 22 per cent less milk and 24 per cent less butterfat than a normal quarter. The sources of mastitis are listed as:

1. New cows introduced into a herd.
2. Injuries and exposure. These are not direct causes, but when an udder is bruised or becomes severely chilled, the chances for mastitis are increased.
3. Improper milking by poor milkers, milking with wet hands, or milking irregularly.
4. Milking machines that are not carefully washed or sterilized.

Mastitis can be detected by use of a strip cup before milking each cow, by examining udders for lumps, or by applying the brom thynol blue test.

Cows that are affected with mastitis to a degree not warranting sale are commonly placed at the end of the line and milked last.

Harlan L. Stevens, 19, of Turner, son of Mr. and Mrs. L. E. Stevens, a 4-H Club boy in Androscoggin County, has been declared Maine's top-notch livestock member for the year. He was chosen by State Club Leader K. C. Lovejoy because of eight years of Club work in which the boy successfully completed 11 projects in pig and beef cattle and poultry. He has taken part in judging contests and regular Club activities and made 36 exhibits at local and state fairs, winning \$65.25 in prizes, including two state championships.

Korndyke Segis Andrie, a Holstein cow owned by A. L. Bowell of Susquehanna County, Pa., recently completed a 365-day record with 31,408 lbs. of milk and 1,146.5 lbs. of butterfat. In six years this cow has produced 88,230 lbs. of milk and 3,266.9 lbs. of butterfat.

Mr. Bowell started his present Hol-

stein herd in 1905, and now has 56 purebred Holsteins. The herd was accredited as free of TB in 1921 and certified as free from Bangs disease in 1933.

Jersey Honors

Ira G. Payne of East Schodack, N. Y., recently won the highest honor accorded a breeder of Jersey cattle by the American Jersey Cattle Club. He has been designated as a "constructive breeder" by the Club, a term adopted to give recognition to Jersey breeders who follow breed improvement pro-

Ira G. Payne, East Schodack, N. Y., (left) receiving Constructive Breeders Registry certificate from Lewis W. Morley, executive secretary of The American Jersey Cattle Club in the New York City office of the Club.

grams adopted by the American Jersey Cattle Club.

In eight yearly records Mr. Payne's Jerseys have 439 lbs. of butterfat and 8,566 lbs. of milk per cow. The herd of twenty cows has been inspected. Ten have been given a rating of "excellent" for confirmation, four "very good", five "good plus", and one "good".

Bridget of Atwood Orchards, an Ayrshire owned by Master Farmer J. L. Atwood of Clinton County, N. Y., recently completed a Senior 4-year-old record of 16,641 lbs. of milk and 670.45 lbs. of butterfat. This gives her third place in the roll of honor.

At left (below) is Korndyke Segis Andrie, pictured with three of her daughters. This cow, which recently made a new Dairy Herd Improvement Association record for Pennsylvania, is owned by A. L. Bowell of Thompson, Pa. (See story).

Farm Credit Board Elections

MARCUS L. URANN of South Hanson, Mass., was recently elected to the Farm Credit Board of Springfield, Mass., and J. Ralph Graham of Bosca-wen, N. H., was reappointed, each for three-year terms. The board, a 7-man body, directs policies of permanent co-operative credit agencies now used by some 200,000 farmers of New England, New York and New Jersey. Board members are ex-officio directors of the Federal Land Bank, Production Credit Corporation, Bank for Cooperatives, and Federal Intermediate Credit Bank. All are units of Farm Credit Administration in the eight Northeastern states.

Mr. Urann is head of Cranberry Can-ners, Inc., a cooperative in eastern Massachusetts whose members produce two-thirds of the nation's cranberries. He was elected by 95 farmers' coopera-tives in the Northeast which are stock-

Marcus L. Urann

president of the Eastern States Farm-ers' Exchange and of the Granite State Dairymen's Association, and president

of the Kearsarge National Farm Loan Association. He's also a director of a poultry growers' association, and was formerly president of the Merrimack County Farm Bureau. He has been on the Farm Credit Board since 1934.

Also directed by the Farm Credit Board is the cooperative short-term credit system composed of 34 produc-tion credit associations, the Springfield Production Credit Corporation, and the Federal Intermediate credit bank of Springfield. The associations served 13,300 farmers during 1938, providing them with \$18,500,000 of short-term credit, chiefly to grow crops or to buy livestock and equipment. At the close of the year, the 34 units had over 11,000 current loans outstanding for \$11,600,000.

The Bureau of Agricultural Econom-ics estimates the 1938 cash farm in-come from sales and government pay-ments of half a billion dollars as \$7,-625,000,000. In 1937 sales of farm prod-ucts brought \$8,233,000,000, with gov-ernment payments of \$367,000,000. In-come from livestock and livestock products had declined less in 1938 than the income from crops.

Song for the New Year

By Elaine V. Emans.

Thank Thee for all the beautiful and new

Beginnings we may make, who need them so—

Now falling short of what we hoped to do,

And what we dreamed we would be-come; and oh!

Now staring at the worlds about our feet

That yesterday were sure and very dear.

With fresh beginnings, Life is yet replete

With hope and dreaming, loveliness and cheer.

With fresh beginnings, hearts can put away

Each failure, each discouragement, and turn

Unto a promising and fairer day —

And slowly, but ah! surely, they may learn

The new is more magnificent, and more Divine than anything they knew before!

J. Ralph Graham

holders and part-owners in the Spring-field Bank for Cooperatives. The bank finances cooperatives which market farm products, purchase farm supplies, or provide business services such as mutual fire insurance. Its present loans amount to \$4,600,000 to coopera-tives serving 150,000 farmers. Mr. Urann succeeds Everett L. Carr, a farmer of Hope, R. I., whose term ex-pired.

Mr. Graham was nominated for the position by 163 National farm loan as-sociations in New England, New York and New Jersey, and was reappointed by Governor F. F. Hill of the FCA. The associations operate mostly on a county-wide basis and make long-term farm-mortgage loans which are financ-ed through the Federal Land Bank. Mr. Graham operates a 200-acre dairy and poultry farm, and is active in many cooperative farm enterprises. He is

Purebred Cows at World's Fair To Get **BEACON FEEDS**

A HERD of 150 purebred dairy cows—representing the pick of two nations—will be fed Beacon Dairy Rations during their six months' stay at the New York World's Fair, beginning next April. Forty of the herd will come from Canada, the remaining 110 will come from the United States. Each cow will be hand-picked by the different breed associations as truly representative of either the Ayrshire, Guernsey, Brown-Swiss, Holstein or Jersey breed.

Shown as part of the dairy industry exhibit sponsored by The Borden Company, the cows

© N. Y. W. F.

will be stabled, fed, cleaned and milked under model conditions. Visitors will be able to watch the process through glass walls.

WHY BEACON FEEDS WILL BE USED

Representing thousands of dollars in money—and shown as the leading specimens of their kind—the health, appearance and milk production of the cows are of the utmost importance. Every care will be taken to see that they get the necessary nutrients in exactly the proportions required.

Beacon is proud of being entrusted with the job of feeding these valuable cows because Beacon Dairy Rations are based on an accurate scientific knowledge of dairy-cow nutrition, and because Beacon has had long practical experience in the problems of feeding for maxi-mum milk production.

You, too, can give your cows the same high quality feed, the same high food values that will protect the health of these purebred World's Fair cows. WRITE TODAY FOR OUR FREE BOOK on "Profitable Dairy Management." Get all the facts about time-tested Beacon Dairy Rations. Learn how economically you can get them for your cows.

THE BEACON MILLING COMPANY, INC.
DEPT. A, CAYUGA, NEW YORK

We make a complete line of feeds for cattle, poul-try, game birds, horses, hogs, rabbits and dogs.

"The Dairy World of Tomorrow" building at the New York World's Fair, which will house Borden's dairy industry exhibit. Scientific pro-duction and handling of milk from cow to table will be demonstrated. The cows will be handled under the Walker-Gordon System and milked on the famous Rotolactor. Cotton Farmers Vote Crop Control

AGRICULTURAL Adjustment Act of 1938 provides for crop control when voted by large majority of growers. On December 10, southern farmers voted on question of control for three crops: cotton, rice, and flue-cured tobacco. Two of the propositions were defeated, rice and flue-cured tobacco, but a heavy majority of cotton growers voted for control.

Accordingly, cotton growers in 1939 will be fined a penalty of 3 cents a pound on all cotton marketed beyond their quota.

One result of cotton voting is more aggressive attitude by AAA officials, who insist that Congress continue Agricultural Act and power to control crops.

SLANT: Crop control policy has never worked in this or any other country, and never will. Chief result has been to regiment farming and to lose foreign markets for American farmers.

For years now, Triple A has been trying to control crops and regiment America; yet farm price level is still ruinously low and few, if any, of the schemes have served to help agriculture. Many of them have been actually harmful. The American farmer,

both individually and through his organization, has not for the most part asked for these schemes. They have been put over by politicians. The farmer has consistently asked for monetary reform, the one thing that would raise the price level, and largely prevent future depressions. To this one almost unanimous request of farmers, politicians have continued to turn a deaf ear.

Under old Farm Board, from 1930-32, government owned 3,400,000 bales of cotton. Under AAA price pegging, government now owns 10,100,000 bales of cotton, or more than 3 times as much. Government holdings under Farm Board were constant threat to cotton prices. It is easy to see, therefore, the weight that three times as much cotton will now have on cotton market and prices.

Hopkins Becomes Cabinet Member

RISEN from WPA Administrator to Secretary of Commerce has Harry L. Hopkins, recently appointed by President Roosevelt to post left vacant by Secretary Roper's resignation. Confirmation by Senate of the appointment is predicted, although there is expected to be an attack on Hopkins for alleged role of WPA in politics. As WPA

Administrator, Mr. Hopkins has been target of much criticism.

Survey published by American Institute of Public Opinion just before Mr. Hopkins' appointment was definitely announced, showed that two-thirds of voters questioned, disapproved his nomination as Secretary of Commerce, partly, it is said, because of feeling that he has been "anti-business" in his attitude.

However, more friendly relations between business and the New Deal are looked for with the new Secretary in the saddle. Mr. Hopkins is one of President Roosevelt's closest friends and advisors, and it is assumed that this will result in more cooperation between Department of Commerce and White House than in the past.

New head of WPA is Colonel F. C. Harrington, a regular army officer who has been WPA engineer and who has been appointed by President Roosevelt to take over his new job as part of his regular line of duty without extra pay. Colonel Harrington's army pay is the limit that he can receive in salary from government without resigning his army commission, so he will be filling a \$10,000 job for \$6,975. After his promotion, Colonel Harrington announced that it will be his policy to see that money appropriated by Congress for relief goes to those who are actually in need, and also that he will endeavor to get the best work and the most useful results from those on relief.

AAA Wants Processing Taxes Again

PLANNED by AAA is attempt to secure another law from Congress this winter to provide for processing taxes on agricultural products. Such a law would provide for a tax laid on making of raw cotton into fabrics, tobacco into finished products like cigars and cigarettes, and the milling of wheat, corn and rice.

Opponents argue that processing taxes would place burden on consumers, serve to impede expansion in textile industry, and that such taxes on cotton would encourage consumers to use more substitutes.

SLANT: Supreme Court declared first processing taxes to be unconstitutional and the Constitution has not changed.

Plan to Help Railroads

ONE OF America's number one economic problems is plight of railroads. To remedy their sad financial situation, railroads proposed last year a wage reduction of 15 per cent. Unions would not agree, threatened to strike.

Innumerable conferences and different approaches to settlement led nowhere, until finally proposed cut was called off, and President Roosevelt asked three railroad officials and three union leaders to form committee to recommend legislation for solution of railroad problem. Committee has just reported. It put much blame for trouble on competition of other forms of transportation, said railroads were highly regulated, most other forms of

transportation were not, which resulted in much "unequal and economically wasteful competition." Committee recommended:

1. Less government regulation of railroads, more cutting of costly, unfair red tape. Committee also asked more freedom for railroads in fixing rates on long and short hauls.
2. More government regulation of other forms of transportation.
3. Less competition by government itself. Government was asked to dispose of its barge lines.
4. Enlarged lending powers by government to railroads through reconstruction finance corporation.

President will study report of committee and from it make recommendations for legislation to Congress. Senator Wheeler, chairman of Senate's Interstate Commerce Committee, stated immediately he would oppose at least recommendation to permit roads to charge more for short haul than a long haul over same road.

SLANT: Agriculture is still tremendously dependent upon railroads, and some solution of problem is therefore of great importance to farmers.

Wheat and Corn Prices Advancing

CROP REPORTS indicate that next year's winter wheat crop will approximate 485,000,000 bushels, smallest since 1935 and 201,000,000 bushels under this year's crop.

Two conditions lead to this smaller crop: one, an 18 per cent reduction in acreage, and two, drought conditions throughout much of wheat belt this fall.

In addition, selling pressure from other wheat countries has greatly lessened. As a result of United States and world wheat conditions, wheat prices are advancing.

True also is this of corn prices. Somewhat bullish corn market is undoubtedly caused by an 18 per cent increase in hog population this fall, as compared with year ago. Corn exports are also on increase.

Included in wheat export picture is offer by United States to Red Cross of 3,000,000 bushels of wheat for distribution in war-torn Spain, where civilians are reported to be starving. Red Cross has already shipped 60,000 barrels of flour, and is continuing to make such shipments.

Free Mail Makes Postal Red Ink

IN THE RED to tune of \$43,811,556 is U. S. Postoffice Department, according to Postmaster General Farley's annual report recently submitted to President Roosevelt. Profit of about 4½ millions would have been made, said Mr. Farley, if Uncle Sam did not have to carry mail free for members of Congress, government departments, and blind persons, as well as subsidize air mail and perform "non-postal" functions. Cost of these free services for fiscal year 1938 was over 48 million dollars.

Highlights of report were:

Americans spent \$4,260,683 more for postage last year than they did in previous fiscal year.

Mail planes had biggest year in their history. Pilots carrying mail flew 46,112,904 miles, or 15 per cent more than in any previous year. Also, citizens sent 11 per cent more mail by air than in other years.

Stamp collectors' purchases amounted to over 1½ million dollars, showing increasing public interest in this popular hobby.

Better roads and automobiles enabled

**I'M GETTING
BETTER RETURN
FROM FEWER COWS**

**LOW-COST PRODUCTION IS MIGHTY
IMPORTANT THESE
DAYS**

"LESS cow to feed and more cow to milk" is the way some farmers sum up the modern dairyman's goal. Much work has been done to better the quality of milk through improved herds, scientific feeding, and reduced bacteria count.

Sheffield has consistently worked with producers to improve milk quality, to eliminate cattle diseases, and to adjust the milk supply to market demand. All this helps in the primary job of Sheffield Farms: sell more fluid milk to more people.

SLANT: If every tax exemption, every special privilege and every government subsidy in the United States were discontinued this would be a much better country.

1938 Not So Bad

LISTED in current issue of United States News, an independent national newspaper, are several reasons why Americans can feel good about the year that has just closed and the one that has just opened:

1. Business better than a year ago.
2. More jobs opening in industry. (A million more jobs than a year ago).
3. More homes being built. (Permits for construction of family homes in December ran 50 per cent ahead of December 1937.)
4. National income going up.
5. Freight traffic rising.
6. More money in saving banks.
7. Greater use of electricity. (Production of electric power set all-time high in December.)
8. Fewer strikes. (About $\frac{1}{3}$ less than in 1937.)
9. Fewer deaths on highways.
10. America's health best in history.

Bad Feeling Growing Between United States and Germany

DIPLOMATIC relations between United States and Germany, strained since recall of American ambassador following recent Nazi persecution of Jews, were further strained by refusal of United States to apologize for Secretary Ickes' Cleveland speech before Zionist Society. In his speech, the Secretary denounced Nazi government and declared that its persecution of Jews carried Germany back to a "period of history when man was unlettered, benighted, and bestial."

Turning down of Germany's official protest was done by Acting Secretary of State Sumner Welles, who stated in plain words to German Charge d'Affaires that recent policy in Germany had shocked American public opinion more profoundly than anything in many decades, and that indignation expressed by Ickes at Cleveland was felt by majority of people in this country. He further told German diplomat that, considering way German-controlled press has been ridiculing and attacking Americans, there didn't seem to be much point to a German protest over Secretary Ickes' speech. **SLANT:** Ickes' speech was perhaps natural but unwise, for while American people deplore German persecution of the Jews and resent German sneers at the United States, yet we have no desire to be drawn into war over them.

Americas Show Solid Front

OUT of Eighth Pan-American Conference, held last month in Lima, Peru, came important agreement signed by all 21 Republics of Western Hemisphere. Agreement, known as "Declaration of Lima", emphasizes common ideals of American Republics—their belief in individual liberty without religious or racial prejudice, the similarity of their institutions, and their adherence to international law—and proclaims their decision to defend these principles against all foreign intervention or activities, and to "work together in the cause of universal accord."

Specifically, agreement calls for consultation among the Republics if any one of them is threatened by acts of force. Whenever a crisis arises, any American country can call for a meeting of representatives of all other signers of Declaration.

Last of the 21 Republics to agree to sign Declaration was Argentina, whose greatest trade is with Britain and Germany and who insisted on keeping its foreign policy free of binding entanglements. Support for a strong and binding statement came from countries nearest to United States. Declaration finally adopted was less binding than the one hoped for by United States, but nevertheless fully expresses "American solidarity."

Also adopted by Conference was Secretary of State Cordell Hull's peace program, which is based on greater freedom of trade among nations and is now to be known to the world as "The Declaration of American Principles."

At the closing session, it was pointed out by Dr. Carlos Concha, president of the conference, that the agreements signed by American Republics offer no threat to other nations, but endeavor to "guarantee and perpetuate the supremacy of the institutions to which we have fixed our hope and our faith—and to seek the peace and well being of humanity through that immense potentiality which encompasses our genuine American ideal."

Bangs Disease Ruins Dairymen

IN HIS annual report, Dr. John R. Mohler, chief of Bureau of Animal Husbandry, United States Department of Agriculture, stated much progress has been made against bovine tuberculosis throughout America, and that chief fight now is against Bang's Abortion Disease. "Additional forces are needed," said Dr. Mohler, "with which to fight Bang's Disease."

SLANT: Right! Abortion is costing American dairymen and other cattle breeders millions of dollars annually. What can be done about it? See Editorial, Page 4.

Persecution of Doctors

FEDERAL Grand Jury indicted in December the American Medical Association, two or three smaller medical societies and 21 leading surgeons and physicians of America, as participants in "an unlawful conspiracy in restraint of trade."

Trouble started when organized doctors, most of whom belong to American Medical Association, opposed a group health association in District of Columbia. This group health organization sought to provide medical care and hospital services for government employees and to do the work with salaried doctors. Medical Association officials report they will fight indictment of lawyers to last penny of resources.

SLANT: Informed authorities state that government does not really expect to secure convictions on indictments, but is using this plan to force doctors to support group plan of state medicine, and to put doctors on salary. Politicians may succeed in doing this, but if so it will be just too bad for progress of science of medicine.

There is a low salaried or wage group who cannot afford to pay doctors' bills. Many of these are being taken care of now by doctors who give their services free of charge. But there probably is a need, and to this most doctors agree, of some kind of

service to give poor people medical care. However, if politicians, through persecution, propaganda or otherwise, force state medicine with bureaucratic control on doctors and the great rank and file of American people, most of us will lose that personal service and contact with a doctor that has saved us and our families in many a critical situation. Most of us want no salaried doctor paid by public taxation and directed by political bureaucrats.

Bottle Business Control

AT WORK in Washington is congressional group known as "Monopoly Committee", investigating American business to try to find out if monopoly oppresses American economic life. Latest work of this committee is investigation of manufacturers who make bottles, fruit jars, and other glass containers.

Testimony showed that two largest bottle manufacturers hold patents controlling 97 per cent of bottle manufacturing business. Witnesses of these companies before monopoly committee stated that bottle prices were not arbitrarily fixed and could not be, "for if we were to have a high price, a paper bottle might take all our business."

It is true that use of paper containers, including those for milk, is rapidly increasing.

Senator O'Mahoney, chairman of monopoly committee, stated that study of patent business in America raises question "whether or not regulations

should be developed to supervise group patenting as it is now carried on."

Good Books to Read

ALONE, by Richard E. Byrd. No one has ever written such a book, for Byrd is the only man living who has gone through such an experience. It is the account of Byrd's five months' isolation at Advance Base, far south of Little America, the simply told record of a man's unaided struggle against death in the solitude of Antarctica.—G. P. Putnam's Sons, New York. \$2.50.

ALL THIS AND HEAVEN TOO, by Rachel Field. If you once take up this novel, you won't lay it down until you get to the last page. Rachel Field tells the story of her own great-aunt, a woman of rare gifts and personal magnetism, who as governess in the household of a Duke of France became the center of a famous crime and that crime the lever which caused the abdication of a French king. She conducted her own defense, and later came to America and married a minister in a small town in Massachusetts. That she should set the town by the ears was inevitable for a time, but she pulled through successfully, helped by her husband's never-failing sense of humor.—MacMillan, New York. \$2.50.

Good Movies to See

TOM SAWYER, DETECTIVE. Just released to fill the need of a children's special during the holidays is this newest version of Mark Twain's "thriller." Donald O'Connor plays the part of Huckleberry Finn, Billy Cook as Tom Sawyer, Porter Hall as Uncle Silas, and Clara Blandick as good old Aunt Polly.

Surge

THE FASTEST

MILKER EVER BUILT

—and Fast Milking DOES Get MORE Milk!

Authorities agree that faster milking DOES get more milk—and Surge is the fastest milker ever built! In addition, Surge milk travels ONLY 4 inches instead of 4 feet from teat to pail. Just 4 pieces of rubber to wash. NO claws. Surge uses rust-proof, easiest-to-clean STAINLESS STEEL in every metal part touching milk. Surge's exclusive Adjustable, Variable Pull feature enables you to do a faster, cleaner, more profitable job with less labor. Sold on Easy Terms.

NEW Surge MILK COOLER

"Shrouded Air Current"

Surge SHROUDED Milk Cooling Unit — Complete with Steel Cabinet

Surge's proved superiority has come about through an exclusive new cooling principle... SHROUDED AIR CURRENT which puts every bit of air to work cooling the entire condenser and greatly increasing the efficiency (explained in our catalog). BIG ICE RESERVE keeps the cooling water ice-cold and cools the milk faster. FACTORY SEALED COMPRESSOR UNIT comes to you ready to run. Does not require a refrigeration engineer... Factory adjusted for maximum efficiency and can be installed in Factory-Made Steel insulated tank or your own insulated concrete tank. Sizes: 2 to 30 can capacity. SHROUDED Unit for your own Concrete or Steel Tank

BY L. B. SKEFFINGTON

from SKEFF'S NOTEBOOK

TWO major issues on which the State Grange declared itself at Jamestown were milk and money.

The delegates without a dissenting voice being raised voted to urge the Legislature to keep its hands off of the Rogers-Allen Law and the present milk marketing program for at least two years. It was declared that the milk program has been highly beneficial to farmers so far, and that it should be continued without amendment or change for a period sufficient to give it a full and fair trial.

After a review of the economic situation confronting agriculture and the country, it was declared "the great majority of farmers feel that managed currency would be a definite benefit to agriculture, and the establishment of a sound monetary system would maintain commodity prices at a constant purchasing and debt-paying level."

The resolution reiterated the Grange's advocacy of managed currency as outlined by the late Dr. George F. Warren, and urged that Congress take appropriate action.

On these two matters the Grange is in line with other farm organizations. It will be recalled that recently the State Farm Bureau Federation declared itself likewise on the two points. Both the National Grange and the American Farm Bureau Federations have voted in favor of managed currency and have requested Congress to set up a monetary authority.

The Grange expressed its disfavor of the recent trade treaty with Canada which lowered the tariff on imports of dairy products and livestock. It voted in favor of continuation of the state milk publicity campaign on the same basis as at present.

It expressed its disapproval of the present distribution of the tax burden. It adopted a resolution pointing out that real estate, "comprised largely of the homes of the poor and middle-class people of our nation, is bearing an unjust share of the tax burden." Real estate, the resolution continued, bears 80 per cent of the tax load and represents only 30 per cent of the total national wealth.

Because of these facts, the delegates voted in favor of a realty tax limitation program. Instead of determining the limitation, it agreed "the tax limit to be arrived at after a careful study of conditions and needs in all parts of the state, and the exact decimal of the tax limit to be voted on at a future meeting of the State Grange."

The Grange disapproved of the diversion of highway moneys to non-highway uses while the burden of buildings and maintaining town highways grows more irksome of local taxpayers. Increasing use of town highways makes additional expense, it was said. The resolution pointed out that the state had recognized the advisability of providing for highway construction and maintenance by levying a gasoline tax, "but only a fractional part is returned to the counties, no part of which reverts to the towns for road construction." The Legislature was asked to change the present gasoline tax law in such a way as will provide relief.

A reduction of the legal rate of interest from six to five per cent was asked, because "large amounts of money are lying idle in banks and drawing only two per cent interest."

There was considerable interest in resolutions introduced on the subject of labor. The one that was adopted declared the Wagner Act is operating in opposition to the best interests of farmers and business men. It was voted to urge amendment of the act to provide:

1—More definite and positive exemption from its provisions for farming

and all other closely allied enterprises of agriculture.

2—Amendment and administration of the act so as to provide equal rights to all.

3—Activities of the National Labor Relations Board should be limited strictly to judicial functions so that in the future it will be impossible for this board to act, as it has sometimes in the past, as prosecutor, judge and jury.

Another resolution asked that it be made a misdemeanor to hunt, fish or trap on private farm property, whether posted or not, without written permission of the owner.

While the Grange acted upon many questions, its general attitude was reflected by action on one resolution from Niagara County. This declared a program for advertising New York State apples to be necessary; pointed out that under the present voluntary program many growers evade their responsibility and benefit by the contributions of others. It would have the state impose an advertising tax of one cent a bushel on all packed apples. The Legislative committee studied this and reported a substitute resolution, which was adopted. This declared that if such a law was introduced, and had the general support of the apple industry, then the State Grange legislative committee was directed to support it.

The Grange voted in favor of:

Exemption from license fees, trucks and tractors used only on farms.

Legislative grant of \$10,000 to the Geneva Experiment Station for research to find new uses for dairy products.

Cooperative effort to eradicate blackbirds and starlings.

State aid in developing regional markets where needed.

Relief for county budgets by addi-

tional state aid of \$600 for each extension agent and \$1,500 for each associate 4-H agent.

Support for state trade mark on farm products.

Labelling foreign eggs and egg products.

Campaign to increase use of butter.

Delaying crop estimates until nearer maturity in interest of accuracy.

Soil conservation payments for ditch construction.

Halving license fees for farm trucks.

Continuing rural electrification program.

Development of the St. Lawrence seaway-power project.

Taxing all income, from whatever source derived.

Fairer tests for spray residue on apples by removal of stem and blow ends before analysis.

Matters which are *opposed* by the Grange include:

Daylight saving.

Parking fees in state parks.

Statehood for Hawaii.

Use of public funds to finance competing public markets.

Abolition of constitutional convention.

A resolution which would have placed the Grange on record for a one-week State Fair was not adopted.

The Jamestown convention was notable for the unanimity and harmony of action and for the support which delegates gave to matters keynoted in the annual address of State Master Raymond Cooper.

Leland Smith of Brashers Falls, deputy for Franklin County, was elected a member of the executive committee to succeed Frank J. Riley of Sennett.

Speakers included National Master Louis J. Taber; Dr. Carl E. Ladd, dean of the State Colleges of Agriculture and Home Economics; E. R. Eastman, editor of *American Agriculturist*; Dr. P. J. Parrott, director of the Geneva Experiment Station, and State Senator Joe R. Hanley of Perry.

Mr. Taber discussed the "Four Horsemen of Recovery" which he termed Agriculture, Labor, Business, and the Consumer. "I challenge you to harness this team with intelligence and understanding," he said, "and then to drive it with mutual respect of one group for the other, and you will find that recovery is at hand."

Mr. Eastman, discussing the Rogers-Allen Law, said "Farmers should get wise to their enemies. Even if the law were taken off the statute books today, it would have more than justified

itself by returning to farmers more than two and one-half million dollars in two months."

Dean Ladd declared that students at the State Colleges of Agriculture are more conservative than were some of their parents. He added that there is no place on the face of the earth today that offers as much security as a farm in the Northeast.

Winners of the State Grange speaking contest for students at state schools of agriculture were: Julius Sippen, Farmingdale, first; Charles Owen, Alfred, second, and Clinton Thompson, Canton, third.

Stars at Fruit Show

Much to their surprise, officers of the State Horticultural Society have succeeded in "landing" Dr. Ira A. Manville for the annual meeting in Rochester Jan. 10 to 13. Doctor Manville is director of the nutritional clinic of the University of Oregon Medical School at Portland. He has been receiving much attention from medical societies and dietetic groups because of his studies of the effect of apples on the human system.

Other notable speakers at Rochester will include Dr. J. R. Magness, principal horticulturist of the USDA; Dr. V. R. Gardner, director of the Michigan Experiment Station, whose address several years ago provoked so much discussion, and J. R. VanHaarlem of the Canadian Experiment Station at Vineland, where exceptional work has been done with peaches.

Nominations for Duncan Fund

Nominations are being received by the Duncan Memorial Fund for its annual awards for practical work or demonstration in better marketing of New York fruits and vegetables. Last year Governor Lehman presented the first award to the late Thomas E. Cross of LaGrangeville. A check for \$50 accompanied the award. Honorable mention was accorded B. J. Case of Sodus, Harry Andrews of Waterloo and Harold Simonson of Glen Head. Nominations for 1938 awards should be sent at once to Webster J. Birdsall, Bureau of Markets, Albany, for reference to the committee of award.

Steuben County Hay Show

Taken at the recent Steuben County Hay Show, this picture shows, from left to right: J. W. Paddock of Bath, John Smith of Kanona, and Robert Van Wormer of Cohocton, winners in the alfalfa, mixed hay and clover classes; Professors Crandall and Burke of Cornell, judges; and Lynn Buckhout of Steuben County Farm Bureau.

Adjudged the best of the sixty exhibits, Robert Van Wormer of Cohocton won first in the clover class and grand champion of the recent Steuben County, N. Y., hay show; John Smith, Kanona, placed first in the mixed hay class; and J. W. Paddock, Bath, topped the alfalfa division. (See picture).

The show, which is to be an annual event, has for its purpose the improvement of 150,000 acres of hay which is

a major crop of Steuben County. Judges of the event were Professors Crandall and Burke of Cornell.

The hay show was a feature of the annual dairy cattle feeding school which gave the several hundred in attendance the recent findings of research as well as the established principles of dairy cattle feeding, and has placed on balanced rations the cows in scores of Steuben County barns.

The Consumer's Choice

By LELAND SPENCER.

IN THE previous article, we attempted to explain the *Two-Price Plan* that was proposed recently as a new feature of the Triple A program. Apparently the sponsors of this plan have given up the idea of pushing it for the present. But the mere fact that a two-price plan was proposed is something to think about. It seems to suggest that some necessities are now available to the public only at one price. Back of that, I dare say, is the thought that competition is not as free in some lines as it should be; that many times consumers are given no opportunity to get milk and other commodities with a minimum of service or frills at a reduced price.

Leland Spencer

Further, it is said that if consumers were permitted to buy at prices based upon a minimum distribution and packaging service, their increased purchases would help to dispose of the surpluses that farmers have been worrying about.

It must be admitted there's something in that line of argument. We know most Americans are strong for the competitive system, "in principle." But a good many are opposed to competition in their own line of business. Lawyers, doctors, architects, and people of other professions that are safeguarded by public licensing, want the requirements made more strict, to keep the number of young competitors within reasonable limits. The bankers of any community can be depended upon to oppose vigorously any proposal to charter a new competing bank. Publishers and drug manufacturers, among others, have tried to fix resale prices for copyrighted or trademarked articles. Milk dealers, also, have done what they could to keep competition within bounds.

The inclination of business and professional people to restrict competition in their own fields is a very natural one, and in past several years it has been encouraged by public authorities and by federal and state legislation. During the depression such terms as "price cutting" and "chiseling" came to have a prominent part in our vocabulary. The N.R.A. was hastily contrived to deal with such "abuses" and to enforce uniformity in both wages and prices. In the agricultural trades, price cutting was to be weeded out by marketing agreements and licenses under the A.A.A. The same problem within the states was dealt with under our milk control laws. The extremes to

which the controllers went is illustrated by the fixing of the same price for store and door-step distribution in many markets, and by the required charge of an extra cent for milk in paper containers. For two or three years (1933-1935) the person who sold for less than the recognized prevailing price was public enemy number one.

Now the tide has turned. To be sure, we have the Miller-Tydings Act, that permits manufacturers to fix resale prices for goods sold in interstate commerce, and the Feld-Crawford Act, that permits the same practice in New York State. But on the whole, the fact that variable prices are the essence of competition is more generally appreciated.

Speaking of the milk business in particular, it should be said that not all the differences in retail prices have been in the public interest. For example, underselling by dealers as result of their failure to carry a fair share of the surplus could not be tolerated when producer returns were too low to sustain at least a minimum standard of living. Such differences have been eliminated under the federal and state marketing orders for New York. But even now milk is available to New York consumers at a remarkable range in price. They can pay any price from 23 cents a quart down to 11 cents or less, depending upon the grade or brand and the type of service or container desired. The top price is for a special brand of Certified milk fortified with vitamin D. The lowest is for Grade B milk in glass bottles at the grocery store. Priced in between these extremes are Grade A milk, Grade B milk delivered to the door-step, and Grade B in paper containers at the store. In addition, many thousands of needy families are privileged to buy milk for 8 cents a quart at welfare depots, and some 30,000 quarts a day are disposed of through that channel.

With a set-up like this, the farmer is assured that the demands of all consumers are fully exploited. It is not practicable to have so much range in grades, services, containers, and prices in a small market, but in many instances the consumer's choice could and should be extended beyond present limits.

Milk Prices

Dairymen's League announces an average net pool return (including differentials), for 3.5 milk in the 201-210 mile zone, of \$2.07. In addition, it is announced that 82 per cent of the League members eligible to participate will receive a special November differential of 20c a hundred. With the exception of last November, this is the highest League return for November since 1930. However, a year ago the League price was 51c above eastern condensery prices, while this year the return is 77c a hundred above eastern condensery prices.

Sheffield Farms announce November price for 3.5 milk in the 201-210 mile zone as \$2.05 per hundred. The November Sheffield price is 18 cents above the October price. Sheffield announce that 14 per cent of the November milk handled was sold in competitive markets not governed by the Marketing Order.

* * *

In New York State milk production per cow per day on December 1 was the highest for that date since 1925, with the exception of December 1, 1936. For the entire country total milk production on December 1 was decidedly (about 5 per cent) higher than a year ago, and about the same as the record production for that date.

Stocks of dairy products are high, but in the case of butter, a large proportion is held by the Dairy Products Marketing Association. Ninety-two

score butter averaged 30c for the first week of December, and the November price averaged 10.8c less than a year ago, the lowest for the month since 1933.

DOWN THE

By J. F. "Doc" ROBERTS

I WISH that you could have all attended our Lamb Show here in Buffalo on December 14th. Mr. Harold Willman of the University Extension Department, assisted by fifteen club agents and county agents, as well as by some of the leaders of the Future Farmers of America and agricultural teachers of the various schools, really put on the Show. We here in Buffalo only acted as a cooperating unit. The boys and girls showed 448 lambs, of which 321 were judged as of superior quality, fat and finish, and therefore were eligible for show and sale as strictly show lambs. These 321 sold for an average price of \$14.57 a hundred. The entire 448 averaged to sell for \$13.32, while the first 16 lambs judged the best in the show sold for an average of 34c a pound, with the Grand Champion lamb bringing \$2 a pound or \$174 to Kenneth Simpson of Caledonia, N. Y., for this one lamb.

While these prices and amounts are not the important feature of this work, they do very definitely prove that improvement in our livestock is not only possible but desired, and the improvement will show a just return. There were over 300 people at our noon dinner that day, both city people and country people, and this again proves not only the interest in livestock improvement and production in the country, but among the city people as well; and again, judging from the increased interest shown and the numbers attending, livestock does have a very vital place in the lives of our people in the Northeast.

I was very much interested and amused when I read in the last issue of the *American Agriculturist* what Ed. Babcock had to say about his experiences in talking politics. In an issue of a few weeks ago, I said that there was "nothing in the cow line selling for less than 3c a lb.", and did I get jumped on! Accused of misrepresentation, accused of abusing the confidence that the *American Agriculturist* had built up through the years, and this all because two cows, which this man had actual knowledge of, sold at 2c a pound. In checking up, I find he is right, but I also find that out of 1003 cows which we sold during the month of October, there were just eight which sold under 3c a pound, and five of these were marked "crippled" or "downers". Justification for reporting truthfully and accurately must rest in the man who is doing the reporting, and I can only assure the readers of "Down the Alley" that they are getting an honest and thought-out interpretation as I see it.

After trips into both Michigan and Indiana livestock feeding sections within the past two weeks, the question that arises most is why the feed this year, when fed even in greater and more concentrated amounts than a year ago, is having no ill effect and all livestock is doing better, in most cases very much better, than a year ago with the same amount of feed and without the death loss in the feeding operations. Very definitely, the only answer is that the feed this year has something which it didn't have a year ago. We cannot say that the animals are different, except as they are different because of different feed. I am wondering if there isn't an opportunity right here to find out what these differences are in the same feed, one year with another. I saw men who were feeding better than twenty pounds a day of concentrated grain to cattle, and plenty of instances where lamb feeders were giving up to two pounds of clear corn per day. A year ago such an operation would not only have thrown the animals off feed, but the death loss would have prohibited it. Anyway, the lesson learned was that this year you can go ahead and fatten your animals without the feeding precautions that you had to take a year ago.

LABORATORY TESTED for practical farmers

Sterling SUGAR CURING MEAT SALT

Double tested—Sterling Sugar Curing Meat Salt takes all uncertainty out of home curing of meats. The formula was developed and tested by the International Salt Research Laboratory. It has been given practical tests by years of successful results on thousands of farms.

Simply follow directions, and you can cure, flavor, and give delicious tenderness to home-cured meats, all in one easy operation. The preserving power of salt, the penetration of saltpeter, the flavor of sugar, spices and distilled liquid smoke—all are properly blended to get uniform results, pleasing delicious tenderness every time.

Ask for Sterling Sugar Curing Meat Salt by name. The 2 lb. 2 oz. can cures up to 20 lbs. of meat. The 10 lb. can cures about 100 lbs. Make sure of good results this modern, easy way.

STERLING SEASONING. Makes tasty sausage. Flavors gravies, roasts, meat loaves, and other food deliciously. Buy it in the economical 7½ lb. can or in 10 oz. or 3 oz. sizes.

GET VALUABLE PREMIUMS. You can get two useful premiums—a heavy, carbon steel butcher knife and a handy, blued steel, bell scraper for removing bristles—through the coupon in each 10 lb. can of Sterling Meat Salt. Coupon permits you to purchase these tools at about half retail cost.

STERLING TABLE SALT. Iodized or Plain. Steam-sterilized. Discover how much goodness it adds to foods. Make the taste test. Convenient, rectangular package has a metal pouring spout on the side. Only 5¢ for one pound, 8 ounces of this fine quality salt.

FREE, ILLUSTRATED BOOK. The pictures and diagrams of butchering and curing are unusually helpful. Easy to follow. Instructions are practical. Tells how to use salt on the farm to increase profits. Write for your free copy of "The Farmers' Salt Book."

INTERNATIONAL SALT CO., INC.
Dept. AA 139 Scranton, Pa.

FREE ON REQUEST

We have 5 Service Leaflets which have saved many dollars for many poultrymen. We have decided to send any of these without charge or obligation to anyone (whether or not they have ever bought Hall's Chicks) who asks for them.

"In publishing these leaflets and making them available to poultrymen, you are performing

A Real Service to the Poultry Industry"

says W. F. Sullivan of the New England Homestead.

These leaflets contain a wealth of the latest information to help poultrymen avoid or minimize losses from the more common causes. They are not written by scientists; they are written by real poultrymen who have a scientific background and training, but who can put down in everyday language the best and latest information, in easily understandable form. These men are working all the time with eggs, chicks, breeders. They know their stuff, practically.

These are the leaflets:

- No. 1. Helpful Hints on the Starting and Care of Chicks.
- No. 2. Coccidiosis and Enteritis.
- No. 3. Prolapse and Cannibalism.
- No. 4. Laryngotracheitis; Bronchitis; Coryza, Pox.
- No. 7. Successful Battery Brooding.

Please request these, or any of them, by number as listed; and they will be sent you promptly, without charge or obligation.

American Poultry Journal says

"A set of 'Service Leaflets' published by you just came to my desk and I'm impressed by the wealth of information they contain."

New England Homestead says

"In publishing these leaflets and making them available to poultrymen, you are performing a real service to the poultry industry. The authors of these leaflets are well known and well recognized as competent authorities to write on such subjects."

Pennsylvania Farmer says

"The 'Service Leaflets' as issued by Hall Brothers Hatchery, Inc., are very concise and interesting. We are very sure they will prove most helpful to poultrymen."

Poultry Item says

"I want to say a word about your Service Leaflets. The subjects are not only carefully chosen, but the treatment is so sound and without bias that I feel you deserve a great deal of credit for supplying your customers and friends with a service of this kind."

Poultry Tribune says

"It is our opinion that these represent a great constructive service and reflect the vision of your outstanding institution."

Cackle and Crow says

"The booklets are simple, yet comprehensively written and are in such form as to be easily filed and readily accessible. This is one of the finest things I have ever seen a hatchery do for its customers."

Quality chicks since 1911. "Never a week without a hatch" since 1927. Pullorum free by State test since 1928. Each year we sell more chicks than ever before. We ship prepaid and guarantee 100% live delivery. Catalog and Price List free. Tel. Wallingford 645-5.

Hall Brothers Hatchery, Inc.
BOX 59, WALLINGFORD, CONN.

CLAUSER'S BARRON LEGHORN CHICKS
From Large Size, heavy production Barron English S.C.W. Leghorns. Hens weigh up to 7 Lbs. Mated with R.O.P. Pedigreed Cockerels. Extra quality chicks from Blood-Tested healthy, vigorous, selected stock. At \$10.00 per 100, \$48.50 per 500, \$95.00 per 1000. Chicks 100% Live Arrival Guaranteed. 10% books order. NEARBY MARKETS for NEARBY POULTRYMEN

Chinking In With Poultry

By L. E. WEAVER

RECENTLY I attended a meeting of the Allegany County Farm Bureau Poultry Committee. They were planning the Farm Bureau's Poultry Program for the coming year. One of the committeemen used the phrase with which I have headed this article. He stated that many Allegany County

L. E. Weaver

dairymen could increase their incomes by "chinking in with poultry", meaning that the addition of a flock of 200 or more birds to the farm business would take up the slack of unemployed periods during the winter and add to the income during the year. There are already surprisingly many of these combination dairy and poultry farms. The committee thought there might be 100 in the county.

One of the committeemen stated that in visiting farm families one could usually tell on which farms there is a good-sized poultry flock just by noting the air of greater prosperity. His point was that the dairy and poultry combination makes so much better income for the farmer that it shows in a higher standard of living. Whether or not that is true, his observation coincides with the results of a survey made a few years ago.

In the Wharton Valley in Otsego County farms getting practically all their income from dairy had an average labor income of \$73, while farms with dairy as a primary industry, but with 8% of their income from poultry; had an average labor income of \$152. Farmers getting 25% of their income from hens had an average labor income of \$656.

I am not suggesting that all dairy farmers should go into poultry. I do think, however, that many could do so to advantage. It would not be wise to add poultry where one is not poultry-minded. I doubt if people who "hate chickens" could ever make a success of poultrykeeping.

Mr. and Mrs. I. J. Terwinkle of Clymer, N. Y., putting pullets into the second story of a chicken house. The "elevator" is the invention of Charles Mayerink. The top of the chute is screened, and the pullets, as they are put in the bottom, quickly climb to the top. It is a lot easier than carrying them upstairs by hand.

One point on which I was over-ruled by the committee is the question of the best time for dairymen to get their chicks. I argued that since they would be busy with farm work in April and May, but might have spare time the latter part of the winter, it would be well for them to get their chicks in January, February, or early March. The committee did not agree with me. They said that on most of these combination farms women do the rearing of the young stock. They can do this to better advantage when the weather is suitable for getting out of doors, than in winter-time. I had to admit that if women are to rear the chicks, mid-winter is not the time to start them. All of which brings us to a topic always timely at this season, namely—the proper time to start baby chicks.

I am glad that Johnny Huttar brought this topic up for discussion in a recent issue. If you missed his discussion I hope you will go back to the issue of November 19 and read it. Apparently Johnny expected me to take issue with him on some of his statements, but I can't think up any good arguments on the other side, and I can't see why I should want to.

Certainly I agree that times have changed. There was a time when "early" brooding meant March or early April, and "late" brooding referred to the latter part of May or June. Back in those days our recommendation to start chicks early certainly was sound. It was based on careful scientific tests. Dr. Card hatched chicks every month of the year, carefully kept records of how much it cost to produce them, how well they lived during the growing period, at what age they started laying, how large their eggs were, and how much their eggs sold for. As a result of his study, he concluded that the natural hatching season, the spring of the year, was also the most profitable.

Years have come and gone. Improvements and discoveries have been made. Ingredients now put in the breeders' ration insure good hatching eggs at all seasons. Improvements in incubators and brooding equipment allow us to brood at all seasons. Improved growing rations add to the success of confinement rearing. Therefore, some of the difficulties met by Dr. Card have disappeared. There is no longer any reasons for not starting the chicks at any time we wish.

However, Johnny was not considering these points. He had in mind another way in which times have changed. It has come about that summer eggs bring more today than winter eggs. The peak of high prices comes earlier in the fall and the bottom of low prices earlier in the winter. Another important change mentioned by Johnny is that the peak is never so high as it used to be, nor do prices go so low as they once did. The "curve" of prices is flattening out. In time it may become a "level". One thing, more than any other, will be responsible for leveling out the curve. It is the time at which we start our chicks in the brooder house.

I have been following the development of out-of-season hatching and have about concluded that some poultrymen should plan to start three broods of chicks each season; one in the fall, one in the middle of winter, another in late spring. Brooding equipment will be kept busy a greater part of the year. Fewer brooder houses and stoves will be needed. The laying house will be used to full capacity practically all the time, because pullets will be

A Family Farm Combine

Allis-Chalmers Manufacturing Co., Milwaukee, Wis., has announced a new family farm combine, which cuts a 40" swath and operates from the power take-off of a one-plow tractor. It can be operated by one man, or two in case grain is to be bagged. The machine will harvest about an acre an hour, and is intended for use on the home farm. It is not recommended for custom work. The family farm is the foundation of agriculture, and this machine seems to be a noteworthy development in helping to maintain it.

The Bayer-Semesan Co. of Wilmington, Delaware, announces two new packages of "Semesan" and New Improved "Semesan Jr." The new "Semesan" package is a 1/8-oz. packet for the convenience of vegetable and flower growers. The new "Semesan Jr." packet is 2-oz., which is enough to dust a bushel of seed wheat or field corn.

Ford Motor Co. engineers, in testing starters used on Ford cars, have a device by which a starter starts and stops a V-8 engine 720 times an hour, day after day. One 85 HP engine was started more than half a million times by one starter without missing.

On Wednesday, November 30, the International Harvester Co. of Chicago was host at luncheon to 1400 boys and girls who attended the National 4-H Club Congress. Following the luncheon, a trip was taken through the McCormick Tractor Works and the McCormick Twine Mill.

The Association of American Railroads reports a steady increase in efficiency in the use of coal. For the first nine months

of 1938, each pound of coal hauled 8 4/5 tons of freight one mile, showing an increase in efficiency of 5.2 per cent since 1920. In the passenger service, efficiency in the use of coal has improved 22 per cent since 1920.

The American Dairy Cattle Club of 11 S. LaSalle St., Chicago, Ill., recently printed a 90-page booklet under the title of "American Indexes for Sires Proved in Dairy Herd Improvement Associations in 1938." The booklet contains an explanation of the function of the American Dairy Cattle Club, together with a list of a large number of sires whose daughters have production records and production figures on these daughters.

The booklet contains a lot of valuable information for any dairyman who is trying to improve production of his herd.

American Suffolk Horse Association, Bushnell, Illinois, will be glad to send you a well illustrated booklet giving the history and much information about the Suffolk horse. Note of this was made in the American Suffolk Horse Association advertisement on page 13 of the October 8 issue.

Why all the gadgets? This tractor has been equipped with a set of special instruments designed to maintain fixed operating conditions during field tests of various tractor fuels. An individual farmer cannot afford to experiment. He must of necessity depend on the recommendations of reliable manufacturers. The engineers conducting the test report that, on the average, gasoline developed 27 per cent more power at the rear wheels than distillate and that gasoline did each unit of work on 21 per cent less fuel. At full load, gasoline developed almost 34 per cent more power than the low grade fuel.

NEARBY MARKETS for NEARBY POULTRYMEN

1939 Eggs

By J. C. HUTTAR

I WRITE this as New Year's resolutions are being made, but as you don't read it until after a few days of the New Year have been spent, it will be about the time they're being broken!

I should make a lot of resolutions myself, but don't because I'm afraid I might be as weak as the fellow who stoutly and definitely swore off drinking on New Year's Day. The next day, however, his mouth became kind of dry toward evening, and out of force of habit, he wandered toward the tavern which he had long patronized. He firmly intended to walk right by it, however. But when he got in front of the swinging doors, he became tired and

J. C. Huttar

stopped. He just thought he'd wish some of his old friends a Happy New Year. No harm in that. Pretty soon one came along who, not knowing this man's resolution, said, "Happy New Year, Jim. Come on in and let me buy you a drink."

To this Jim answered eagerly, "Well, you forced me. Let's go."

So you'll have to put me into that class of people who suggest good resolutions for others to make, but who are careful not to make any themselves. But I'll promise not to be too hard on you. You folks, who have been my faithful readers, should really get quite a bit of consideration. You take my scoldings about egg quality without a murmur, or practically so, and even put some of my suggestions into operation. I know you do because I've talked to a lot of you in the past year.

You don't always agree with me. Oh, no; and I'm glad of that. I have a boy home who's just getting to the age (almost 9) where he occasionally questions my wisdom and my authority, and puts up quite an argument. In fact, it gets to the point, once in a great while, where I am unable to save my face in any other way except to chastise him. When I've done this, I always think how glad I am that he's got so much spunk. I believe I wouldn't like a boy who agrees with me all the time. That is, not my own boy. I think that's nice for other folks' boys.

Now, what has all this got to do with egg marketing in 1939? The answer is, "nothing". But it seems as though a fellow is entitled to get a few things off his chest once a year that aren't all business.

CRYSTAL GAZING

One of my bad habits is to "stick out my neck" about this time each year by making some so-called predictions. But experience has tempered my rashness to a point where I merely give all the facts I have on the poultry situation as I see it now, and then give my opinion as to what this might mean in egg marketing in the next twelve months. I point out, however, as I have in each of the last few years, that it's only one man's opinion, and that you should draw your own conclusions.

Storage—Storage holdings, of course, are still below last year, but the withdrawals from the warehouses has slowed up considerably, and the shortage is only half what it was a month ago. This is in spite of lighter fresh receipts at the big markets. There's been a

pretty good profit in storage eggs this year.

Hatching—Last spring's hatch was larger than in 1937. The increase, however, came late in the season. The change in number of chickens hatched varied in different sections. There was an increase here in the Northeast and also in the Middle-West, but a decrease on the Pacific Coast.

Number of Layers—Due to the heavier hatch and to lighter culling of laying flocks this summer and fall, because of lower feed prices, the number of layers is heavier this year. About all layers are now housed, and the full strength production is just making itself felt.

Egg Production—Egg production is shown in two ways—the reported fresh receipts in the large city markets, and the number of eggs handled by the egg packing and marketing plants.

Total receipts in the four largest markets in the country show a decrease of about 7 per cent for 1938 over 1937.

In the past two months egg collections at 65 Pacific Coast packing plants were about 80,000 cases, or 20 per cent less than in the same two months in 1937. At the same time, 230 plants in the Mid-West received about 30,000 cases more, an increase of 40 per cent over last year, and 26 cooperative marketing units in the Northeast showed no change as compared to a year ago. These figures might indicate something since it was the 1939 laying flock that produced these eggs.

I would say that, barring too much severe weather, total production about now is beginning to exceed totals of a year ago, and should stay ahead.

Consumption—Egg consumption figures have been very poor this fall and early winter. With improving business conditions, it is hoped this situation will also improve.

1939 Hatch—All indications point to a very big hatch this coming spring, especially in the Northeast and Mid-West.

The Crystal Says

Now, we're down to my opinion, for what it may be worth. There should be many more eggs laid in 1939 than in 1938. The big increase should come in the last six months.

Consumption of eggs should be better, but may not be enough better to hold prices up to 1938 figures.

Unless feed prices continue as favorable or even more favorable than last year, hens will have to do better, expenses will have to be kept down, and more care of market eggs will be necessary to be sure to get as near top prices as possible for what goes to market.

There it is. Now, let's hear the arguments.

"I'm going to try one of them egg shampoos I seen advertised in the village beauty shop if Bertha only cooperates."

As fast as the logs were ready the men yarded them in a nearby field.

Making Most of the Woodlot

By R. B. PARMENTER.

BY MANAGING the cut of the timber on her farm and by marketing it herself, Mrs. F. S. Cooley of Sunderland, Mass., was able to obtain a good stumpage price, keep her team and men during the winter, and leave her woodlot in fine growing condition. The first thing Mrs. Cooley did in the latter part of January 1937 was to call in the Extension Forester of the state, who happens to be me. We discussed the questions of selecting and marking the proper trees to cut, and locating a market where she could sell the lumber for the best price, other than what she wanted to use on her own buildings.

I spent one afternoon marking some pines which were from 60 to 70 years old and which were sawed into 75,000 ft. of lumber. Mrs. Cooley and I visited a number of mill men in the vicinity in order to interest them in these logs. Several inspected them and put in bids. Finally a nearby concern offered \$12

per 1,000, yarded, and the deal was closed.

Mrs. Cooley had one man who worked on the place regularly and a team of horses. She hired two choppers, and as fast as they had the logs ready, her man and team yarded them in an open field nearby. She found it necessary to advise and make suggestions to the choppers so that the trees they cut were salable. The lot itself was left in a good condition for reseedling, and undoubtedly within a year or two enough new trees will be started to guarantee a second crop. This year a similar procedure will be followed on the remaining part of the stand.

Mrs. Cooley kept an accurate account of all expenditures, including the time of her hired men and team, and the hired man scaled all of the logs with an International log rule, keeping an accurate record of the number of board feet so that Mrs. Cooley was able to

figure out her profit on the operation.

The amount cut was 35,000 ft., and it was found that the chopping and logging costs amounted to \$3 per thousand, leaving a stumpage value of \$9 per thousand. Mrs. Cooley is fortunate in having an outlet at home for much of the limb wood and unsalable timber which is used as fuel for making maple sugar.

The farm woodlot seldom gets the management it deserves. Too frequently a crop of logs is either sold to the highest bidder or to a mill man who makes an offer for it. Too often the trees are cut in such a manner that no reproduction takes place for many years. Then cherry, poplar, or other undesirable species come in, though eventually desirable trees may get a foothold. But in the meantime taxes and interest on the investment are mounting and the land produces nothing.

Chinking in With Poultry

(Continued from Page 21)

coming in at various times of the year to take the places of those that have died or have been culled.

Of course there will be new problems to be worked out, although some of the questions about out-of-season rearing can be answered now.

It is probably true, as Johnny suggests, that each hen has inherited ability to lay a given number of eggs. Under favorable conditions she will lay just that number of eggs, and no more. The more she lays in the early part of the year the fewer she can lay at the other end. So, it seems to me that in order to have the birds laying plenty of large eggs when prices are at their best one must start his chicks at one or the other of two fairly definite dates. Pullets hatched in January or February will begin laying in June or July. They will be laying large eggs by the following August, September and October. Or, chicks started in May and early June will start laying about the time prices start downward, but they will still be laying when the next period of high fall prices comes around. The eggs will be large too.

Now it would seem that there could be but little choice between these dates. Apparently there isn't much difference, but I am still inclined to think that on the whole the winter chicks are the best bet, and for these reasons. It is possible to get plenty of large eggs from such pullets at both ends of the season by forced early molting. On the other hand, one must be a good manager indeed to hold all the late-hatched pullets in good production the following fall. It requires expert use of lights and wet mash or pellets, perhaps other expedients.

Another handicap with late pullets is that they often fail to make normal growth in hot weather. So they start laying while they are under-sized and their eggs are small. They may never get to laying full-sized eggs. With fall-hatched chicks this should not be a difficulty. They make all their growth during cold weather.

Some Folks Grow Turkeys

Instead of the three-broods-a-year plan one might try one of the turkeys-with-chickens combinations. As soon as the last lot of pullets is old enough in the spring to do without heat they are moved to range shelters and the brooder houses filled with poults. These are all marketed before the time to start more chicks in the winter or spring. I saw a turkey grower this fall who reverses this plan. About mid-summer he moved his turkeys from the brooder houses with wire floors to a large open field where they were being finished for the fall market. The brooder houses had been filled with crossbred heavy chicks. They will be ready as broilers for the fall market, or as roasters for the winter and early spring trade.

LETTERS

North American Accident Ins. Co.
Dear Sirs:

In an automobile accident in June of this year, I sustained a broken vertebra and leg injury.

I want to thank you most sincerely for your kind consideration and prompt payment of the \$130.00 claim I presented which helped meet my many expenses. Am very glad to have had this policy which I had taken only a few months previously and assure you my husband and I will always keep protection with your company.

Sincerely yours,
TERESA ROMYNS.

* * *

Marlborough, Conn.
December 14, 1938.

North American Accident Ins. Co.
Dear Sirs:

Your check received for \$102.86 covering the time I was unable to attend my work as landscape gardener for the State. It certainly is a great insurance and gives you a lot of protection for \$1.00. Anything I can say that will be a boost for it, I will be glad to do so.

I also enjoy reading the *American Agriculturist* which we have taken for several years.

With the best of wishes.

Very truly yours,
HENRY A. ISLEIB.

* * *

Waterville, Maine,
November 26, 1938.

North American Accident Ins. Co.
Gentlemen:

Received your draft for \$60.00 paying me for time I was laid up account of auto accident at Benton, Maine, September 25th. Do not see how any one can go without this insurance as claims are promptly paid. My wife and I both have a policy and would not be without your insurance.

Thanking you for courtesy and prompt payment of claim, I remain,

MR. & MRS. JOSEPH TRUEMAN.

* * *

St. Albans, Vt.
September 28, 1938.

North American Accident Ins. Co.
Dear Sirs:

I wish to acknowledge your check for \$31.43, accident insurance, received by me, September 24th. It was much appreciated, as I was working to obtain funds to attend agricultural school. I was unable to do any work for three weeks following the accident.

I am sure after the "square deal" I have received, this insurance, in our family will be kept up, indefinitely.

PHILIP O. NEWTON.

Poughkeepsie, N. Y.

LET'S GO! To California in February

REQUESTS for information about our California Winter Tour have been coming in by armsful. The date of departure is Saturday, February 25. That is still several weeks away, so there is plenty of time to get information about the trip and to make all arrangements for going. However, the time of leaving will be here almost before we know it, so we suggest you fill out the coupon on this page today.

In the printed folder explaining the trip, there are two statements which need explanation. This is important both to the many hundreds who have already received these folders and to those who will send for them.

The first of these concerns purchase of tickets. Under the heading "Routing Instructions" the printed folder says tickets should be purchased from the home agent. That is incorrect. Send in your \$5 deposit with your reservation to the editor, *American Agriculturist*, P. O. Box 367, Ithaca, N. Y., and tickets will be sent to you by the Northern Pacific Railway after you have made full payment.

The next item comes under "Clothing" and says, "Be sure to take along a comfortable pair of shoes. You will be doing a lot of walking." The suggestion about shoes is all right, but with the exception of your visit to the World's Fair, it will not be necessary

for you to do any walking unless you wish to. All sightseeing trips are made by bus, and the amount of walking you will do will be entirely up to you. We mention this because some of our older friends who like to go on these tours feel that they will not be able to stand a lot of walking.

By the way, if you haven't read the complete itinerary on page 2 of the December 17 issue, look it up and read it now. Among the high spots of the trip are the Grand Coulee Dam, the world's largest masonry structure; a motor tour over the Columbia River Highway; the Golden Gate Bridge; the World's Fair; Hollywood; Mission Inn; and the Grand Canyon of the Colorado.

These are just a few of the things you will see, and in addition to sightseeing, our friends who have gone on previous trips always tell us about the fine friendships they have made. The ladies, of course, enjoy respite from cooking, particularly in view of the wonderful meals that are served on these trips.

We are getting a good many questions about details of the trip. If you have any questions, no matter what they may be, do not hesitate to ask us. We are glad to give you information on any point. The important thing now is to write for the pamphlet which gives full details about the trip.

Dear Mr. Eastman:

I am interested in your California Winter Tour. Please send me, without any obligation on my part, full information regarding cost of trip, with complete itinerary. (Write plainly.)

Gingerbread

CONTEST ENDS

Winner is Mrs. Houghtaling of Wayne County

A DELICIOUS SMELL of gingerbread pervaded the mezzanine floor of the Hotel Jamestown, at Jamestown, N. Y., during State Grange Annual Meeting, week of December 11. And no wonder! In Parlor A on that floor was row on row of prize gingerbreads—one from every Grange county in the State and each one the work of a county gingerbread champion.

Over 3000 Grangers (including dozens of men) took part in the Subordinate Grange gingerbread contests which began last spring, but only 52 women got as far as the State contest. Some of the men made the Pomona contests, but failed to win first place in any of them and therefore were eliminated before the State contest. However, the men did have a part in the State match, for one of their sex was on the judging committee. He was Mr. Ross Davis, a prominent Jamestown baker. This is the first time that a man has served as a judge in the State contest.

Serving with Mr. Davis were Mrs. Dana Waldron, of Wolcott, N. Y., and Miss Hazel Williams, Home Economics teacher in the Jamestown High School. If anyone thinks that it is an easy job to judge 52 extra-special gingerbreads and pick the winners, they should have been on hand to see our three judges working hard from 11 a. m. until nearly 5 p. m. Tuesday, the 13th. Every gingerbread was scrutinized, tasted, and scored according to the contest score card.

Winners' names were kept a secret until Thursday morning, Dec. 15, when they were announced from the platform by H. L. Cosline, associate editor of *American Agriculturist*.

Present to receive their cash prizes were several of the winners, including first prize winner Mrs. Raymond Houghtaling of Sodus Grange, Wyoming County, who was awarded \$25.00

was used by many of the prize winners, with variation in the brands of flour and molasses used. Mrs. Houghtaling's method of mixing, it will be noted, is the standard method of mixing a butter cake. Instead of adding the hot water last, as the original recipe directs, Mrs. Houghtaling adds it to the molasses and then adds the liquid and dry ingredients alternately, a little at a time, beating after each addition. Mrs. Houghtaling uses a very fine cake flour for her gingerbread, and says that she is always careful to measure the ingredients very exactly.

A very close second in the contest was Mrs. Alton MacDuffie, of Pavilion, N. Y., whose gingerbread scored only one point below Mrs. Houghtaling's.

(Below)—Second prize winner, Mrs. Alton MacDuffie, of Pavilion, N. Y.

Winner of the third prize, 17-year-old Ruth Rhodes of Greenfield Center, N. Y.

by *American Agriculturist*, and the following merchandise prizes:

From Kalamazoo Stove Company:

A handsome modern Governor Coal and Wood Range, in Ivory and Tan, porcelain enameled inside and out.

From Cooperative G.L.F. Products, Inc.:

24½-lb. pkg. G.L.F. Quality Patent Flour; 5-lb. pkg. G.L.F. Self-Raising Pastry Flour; 5-lb. pkg. G.L.F. Patron's Pancake Flour; 5-lb. pkg. G.L.F. Old York Graham Flour; 5-lb. pkg. G.L.F. Whole Wheat Flour; 5-lb. pkg. G.L.F. Golden Blend Flour.

From R. B. Davis Company:

5-lb. can of Cocomalt; 2-oz. can of Davis Baking Powder.

From International Salt Company:

10-lb. can of Meat Salt; Butcher knife.

From Penick & Ford, Ltd., Inc.:

Large can of Brer Rabbit Molasses.

From Pillsbury Flour Mills Company:

24½-lb. sack of Pillsbury's Best.

Mrs. Houghtaling's gingerbread recipe appears on this page. As stated, it is the Br'er Rabbit "My Best Gingerbread" recipe. This same recipe

Mrs. MacDuffie received a \$10.00 check from *American Agriculturist*, and all of the above merchandise except the stove. The next eight winners listed on this page received cash prizes from

American Agriculturist and all of the merchandise prizes mentioned except the stove. The next ten winners each received a check for \$1.00 from *American Agriculturist*.

The gingerbread of Winner No. 6, Mrs. Carrie Hyke, created a good bit of interest because it arrived with a small piece out of one corner and with the following note: "Just as I was packing this, the baby stuck his finger in it." The judges decided that babies will be babies, and when scoring the cake they ignored the little hole.

American Agriculturist takes this opportunity to thank all who helped to make the gingerbread contest a success, including our three judges who labored to pick the State winners; Mrs.

(Left)—Mrs. Raymond Houghtaling, of Sodus, N. Y., whose gingerbread won her the coveted title of State Gingerbread Champion and a slew of prizes.

STATE GINGERBREAD CONTEST WINNERS

Name	Grange	County
Mrs. Raymond Houghtaling	Sodus	Wayne
Mrs. Alton I. MacDuffie	Pavilion	Genesee
Miss Ruth Rhodes	Greenfield	Saratoga
Mrs. J. S. White	Ft. Dayton	Herkimer
Mrs. O. D. Cooley	Liberty	Sullivan
Mrs. Carrie Hyke	Randolph	Cattaraugus
Mrs. Claire C. Foster	Bath	Steuben
Mrs. Adah Kinney	Argyle	Washington
Mrs. Helen W. Van Wagnen	West Sparta	Livingston
Mrs. Emily L. Dodd	Otisville	Orange
Mrs. Clara Casselman	Sherman	Chautauqua
Mrs. Clifford Cofield	Dale	Wyoming
Mrs. Ruth M. Newcomb	Benton	Yates
Mrs. John W. Baker	Weedsport	Cayuga
Mrs. Ethel Reese	Crum Creek	Fulton
Mrs. Elsie M. Slate	Pleasant Valley	Oneida
Mrs. Elsie L. Wilson	Evans	Erie
Mrs. Kenneth L. Wells	Sound Ave	Suffolk
Mrs. Floyd Lounsbury	Clarksville	Albany
Mrs. R. E. Slosson	West Chazy	Clinton

Gingerbread contest judges hard at work. Left to right: Miss Hazel Williams, Home Economics teacher in Jamestown High School; Mrs. Dana Waldron, of Wolcott, N. Y.; and Mr. Ross Davis, prominent Jamestown baker.

Leslie Tanner, State Chairman of Service and Hospitality Committee; all of the Subordinate and Pomona Chairmen of Service and Hospitality committees who had charge of the contests in their Granges; and also Mr. Charles Laycock, the efficient and genial manager of the Jamestown Convention and Visitors Bureau, who handled all the arrangements for the Gingerbread Contest along with the countless other things he did to make Grangers enjoy their stay in the friendly city of Jamestown.

LESSON VIII. SOUPS

SOUP-MAKING need not be difficult, in spite of the long list of ingredients usually included. A well-stocked cupboard ordinarily has condiments, spices and herbs anyway and it is then just a matter of a little of this and a little of that.

In the cupboard there should be a supply of dried herbs, especially bay-leaf, thyme, parsley, marjoram and celery leaves and the condiments, curry powder, horseradish, kitchen bouquet and the sauces Worcestershire and Tabasco; in addition to the dried herbs and condiments, onion or onion juice, or perhaps a suggestion of garlic, appeals to most palates even though they object to onions or garlic as such. The various salts, flavored with celery, onion or garlic, offer a substitute when any of these particular vegetables happen to be absent. Spices which are very convenient to have on hand are allspice, cloves, mace, paprika, and pepper either black or white. The whole rather than the ground spices give a somewhat more pleasing flavor if cooking time is sufficient to draw the flavor out.

Generally speaking, soups are classified as those with stock and those

without stock. Within both classes are all degrees of nourishment, of thickness and thinness, as well as the greatest possible variety of combinations of vegetables and seasonings. The stock may be from meat, fish, or poultry. Brown stock is made from lean and fat beef and bones, and a soup made from these would be highly seasoned. White stock is obtained from chicken, turkey, or veal and should be delicately seasoned.

Soups without stock are made with water or milk or a combination of the two. The water is usually vegetable stock in which the vegetables are cooked; those with milk as a basis are cream soups. If fish or shellfish is used in the cream soup, it is called a bisque.

The meat for stock should be one of the cheaper cuts, shin or lower part of the round. The shin also has bone with marrow in it and a large proportion of gelatin and extractives which give good flavor to the soup. If one wants to serve a jellied soup, it is absolutely necessary to have a high percentage of gelatine. If it is not present in the soup, it has to be added in the commercial form. A proportion of half meat and half bones by weight gives a good flavor. Meat for soup should be wiped with a damp cloth and cubed; bones should be cracked.

The stock pot is important. It may be iron, enamel or aluminum, but it should be perfectly smooth whatever it is. It also should have a tight-fitting cover. A puree strainer or potato ricer is another very handy tool in soup making.

In French homes, where the world's best soups are made, the soup pot always stands on the back of the stove. Their pot-au-feu (pot-on-the-fire) is famous and very thrifty. Into this pot go bits of left-over meat, vegetables, vegetable waters, outside leaves of celery, lettuce and cabbage, and fresh soupbone or fresh meat if desired. They are careful not to overcook the vegetables as this causes disagreeable flavors. Before serving, the soup is strained and seasoned.

The food value of soup with stock is increased if rice, barley, spaghetti or noodles are added. If peas, beans or lentils are added to the stock, then the soup may become the main dish of the meal. Salt pork is often cooked with these legumes to give a good flavor. However, a ham bone with some lean meat on it is richer in food value. A good garnish for one of these thick soups is leftover sausage meat, broken into pieces, browned and sprinkled over the soup. Frankfurters, sliced thinly crosswise and browned slightly in butter also add zest to bean soup when floated on it.

Cream soups start with a medium white sauce, 2 tablespoons each of fat and flour to a cup of milk. The fat, flour, and seasonings are blended carefully, cold milk added gradually and cooked until medium thick. Then just before serving, the strained vegetable

(Continued on Page 27)

QUESTIONS

(Send your answers to the following questions to American Agriculturist Cooking School, Box 367, Ithaca, N. Y., by January 21 if possible.)

- 1—How are soups classified? Give examples of each.
- 2—What do vegetables add to a soup besides bulk? (Review Lesson IV on vegetables.)
- 3—If you were entertaining your women friends at luncheon, what type of soup would you serve?
- 4—When and to whom would you serve bean, pea, or lentil soup? Why?
- 5—Why does soup stock become thick when cold?
- 6—Why add soda to tomatoes before combining with the white sauce in the cream soup recipe?
- 7—How does a bisque differ from other cream soups?
- 8—How does a meat and vegetable soup differ from a meat stew?
- 9—What are the chief spices used in seasoning soups? The condiments? The herbs?
- 10—Do you use other seasonings for soups not mentioned here? Do you grow the herbs yourself?

(EDITOR'S NOTE: Copies of back lessons will be furnished to new contestants, or to any who have missed some of the lessons. Write for these to American Agriculturist Cooking School, Box 367, Ithaca, N. Y. For additional helpful literature, write to list of food manufacturers published with lessons in our recent issues. Your College of Home Economics and the U. S. Department of Agriculture, Washington, D. C., will also furnish bulletins on preparation of food.)

"A Kalamazoo Direct to You"

To Relieve Bad Cough, Mix This Recipe, at Home

Big Saving. No Cooking. So Easy.

You'll never know how quickly and easily you can relieve coughs due to colds, until you try this famous recipe. It gives you about four times as much cough medicine for your money, and you'll find it truly wonderful, for real relief.

Make a syrup by stirring 2 cups of granulated sugar and one cup of water a few moments, until dissolved. No cooking needed—it's no trouble at all. Then put 2½ ounces of Pinex (obtained from any druggist) into a pint bottle. Add your syrup and you have a full pint of medicine that will amaze you by its quick action. It never spoils, lasts a family a long time, and tastes fine—children love it.

This simple mixture takes right hold of a cough. For real results, you've never seen anything better. It loosens the phlegm, soothes the irritated membranes, and quickly eases soreness and difficult breathing.

Pinex is a compound containing Norway Pine and palatable guaiacol, in concentrated form, well-known for its prompt action in coughs and bronchial irritations. Money refunded if it doesn't please you in every way.

Six Hundred Bushels of Potatoes

The Amateur Poet's Corner

"THREE DOLLARS and a half for a bushel of potatoes, and they may be five if the war goes on," a prominent dealer said recently. "This German war has outdone the Colorado potato beetle as a price raiser."

That brought vividly to my mind the time when the Colorado potato beetle, on its eastward migration, first reached the old squire's farm in Maine. Farmers said to one another that the days of raising potatoes were past. Paris green, London purple, bug death and other insect poisons had not yet come into use. There seemed little use in planting a crop, if a few weeks later the pest would devour the young shoots. The price of potatoes soon rose from fifty cents a bushel—the usual price—to two dollars.

At our old farm in Maine the only way we could think of to escape the pest was to plant our potatoes at some remote clearing in the wilderness, miles from any other farm. We hoped that the pest would not cross wide tracts of woods. At one of the old squire's forest lots that bordered the upper course of Lurvey's Stream there was a sunny opening where a forest fire had burned off the growth and left a plot of two or three acres of brown alluvial loam. It bore grass, and we had stacked hay there for the logging camps. We decided that that opening, seven miles away in the woods, might be safe for a crop of potatoes.

The drawback to cultivating the land was that it was so very inaccessible. There was no road to it, and, on account of intervening gullies, swamps and brooks, we could not build one without heavy expense. In winter, of course, we could travel on the ice of the stream that bordered the opening.

The plan that we finally hit upon was to load a plough, a harrow and the seed potatoes—twelve bushels—in a bateau such as Maine lumbermen often use on rivers, and to pole the craft upstream to the opening. The span of horses for ploughing we led there, singly and unharnessed, through the woods.

Farmers usually allow from seven to ten bushels of seed potatoes to an acre; but by cutting off the seed ends of the potatoes, before starting, and leaving the butts at home, we managed to make twelve bushels serve for seeding about two and a half acres.

The land ploughed easily, for it was loose new loam—fine soil for potatoes. We needed no fertilizer, and we had no weeds to contend with; the seeds of barn grass, nettle, dock and other noxious weeds had not yet found their way to that little sylvan nook. Working there was a pleasure. After we had got the seed into the ground, all the care that we had to give this crop was two days of hilling in the latter part of June.

And how those potatoes grew! The stalks literally covered the ground. Later, when the blossoms fruited in clusters of green potato balls, we might have gathered a cartload of them.

In September, when frosts came, the crop of luxuriant pink-white potatoes fully bore out the promise of blossom and ball. One cuff of the hoe would disclose a dozen or more large, clear tubers, ready to be gathered up in baskets. Not a bug had found its way there.

When we dug them up they lay in veritable windrows across the flat—seven hundred bushels of them, at least.

The question then rose—a question to which we had given little thought thus far—how we were to transport all of those potatoes through the woods. At that season of the year it was virtu-

ally impossible. We realized that not until Lurvey's Stream froze could we get them home, or to market. Meanwhile, what could we do with them? In Maine, after the first of October, freezing nights are likely to occur at any time.

The old squire came up and looked the situation over. "We shall have to dig them in, and leave them here till snow comes," he said; and he set our three hired men at work to dig a potato pit, or cellar, in the side of a shady bank near the stream. They prepared a kind of cavern in the dry

By C. A. STEPHENS

earth, and covered in the entire crop first with boughs and then with earth, shoveled down from the top of the bank.

Except for twenty bushels that we drew home on sleds in December, the whole crop lay there until the first week in March, when the old squire contracted to deliver six hundred bushels in Portland at two dollars a bushel.

Moving potatoes in winter weather is always a ticklish business, since potatoes freeze even more readily than apples; and the slightest chill turns potato starch to sugar and gives the tubers an unpleasant sweetish taste when cooked. We would have waited until April, but it was necessary to haul them down the stream on the ice; and the ice would not hold much longer. Throughout January and February there had been a winter road on the stream, and it appeared still to be safe.

The nearest railway station was fourteen miles away. The old squire had reserved for the fourth of March two box cars that had stoves in them; and as it was necessary to have the potatoes there on that day, he hired four teamsters with their teams. We reckoned that a hundred bushels was a sled load for a span of horses, and so, with our own two teams, were prepared to carry the load.

At that time potatoes were generally shipped in burlap sacks instead of barrels; each sack held a bushel and

a half. The old squire had bought four hundred of those sacks. On the second of March we opened the pit in the sandy bank beside the stream. The potatoes had kept well; only a few of them had rotted.

We had started at three o'clock that morning, and by eight o'clock the six loads were on their way down the stream. The old squire sent them off, one after the other, with a distance of a hundred yards or more between them, in order not to bring too great weight on the ice at any one place.

"Keep apart," he told the teamsters. "Don't drive close up one behind another. If the head team stops, you must all stop and wait till it starts on."

But when they were about three miles on their way, at a point where the stream turns round a wooded bluff, the forward team broke a whiffletree, and, without signaling back, the driver stopped to patch it up. Unmindful of the old squire's orders, those behind kept on, closing up as they came round the bend, until all six teams were not far apart.

As the drivers potttered with the broken whiffletree, they noticed that water was gushing up on the ice; and before they could either back their teams or start on, the ice slowly sank down under them, and left their loads in three feet or more of icy water.

A great commotion ensued, while the men shouted and lashed their horses in an attempt to pull out. The ice cracked and settled lower still. Fortunately, the stream was only a few feet deep there, or the horses would have been drowned and the loads lost. The ice kept settling until it rested on the bottom; and there they all were, the horses up to their sides in water, the drivers wading about, and the sleds more than half submerged.

At that moment the old squire, Addison, Halstead and I came up. We had stayed behind to close up the pit, in order to keep the rest of the potatoes from freezing.

We got the horses out and then, with a long warping line tried to pull the loads out on the firmer ice below. A bitter wind had risen, and we were all of us soon wet to our waists. It was a discouraged crowd that toiled for

Because of the number of contributions, we do not return poems not published. Keep a copy of your poem.

The limit in length is sixteen (16) lines and poem must be original and written by an amateur. \$2.00 will be paid to the author of each one printed. Check will be mailed on or about first day of month following publication.

Another Year

Does Hope lie slain,
Felled by Despair?
Rise up again!
Do battle there.

Fan the fire
Of Life anew;
Create desire
To live and do.

Let not Courage
In vain to cry,
"Stifle me not,
Or I shall die."

March on thy way
Joyously led.
Challenge each day
With lifted head.

—Bessie Nichols,
Ellerslie-on-Niagara Farms,
Youngstown, N. Y.

hours that day to save those potatoes.

At last, about sunset, we got the last of the six loads on to firm ice close to the bank where the fir woods bordered the stream. But the old squire, who was pretty thoroughly chilled, was about ready to give up.

"We may as well drop it and go home," he said. "It'll be zero weather before morning. These potatoes will freeze here in spite of all we can do. If we go on with them, they will freeze on the way."

But six hundred bushels of potatoes! Twelve hundred dollars' worth! It seemed to us nothing short of calamity.

"Don't you suppose, sir, that we might build a fire close by the sleds, and perhaps keep them from freezing?" Addison suggested. "I read that a man in Florida saved his orange orchard that way."

Addison referred to one of the first accounts published of attempts to ward off a frost by kindling fires in the open.

"I'm afraid it will be colder here before morning than it ever is in Florida," the old squire replied. "And more than half the sacks are wet."

"But we might save part of them." "Maybe," the old squire said dubiously. "Well, you can try. We can at least dry our feet by the fire."

There were axes with the sleds, and there were plenty of fir trees—soft wood—at hand with pitchy branches and boughs that make a hot fire. Within five minutes after the word was given, trees were crashing down and the branches being lopped off. We drew the sleds up close together, piled the green boughs on the bank to the windward of them and made great piles of them where the heat would be wafted over the loads of sacks.

Cold as the night was growing, the heat to the leeward of the sleds was intense. The wet sacks were soon steaming visibly. The old squire, however, was still doubtful about the success of the plan.

"It's hot enough here now," he said. "But you'll have to keep this up. If you let the fires go down even for half an hour, the potatoes will freeze. You will have to work all night, boys."

"Well, we will" said Addison resolutely.

"But you'll need food before morning, and these teams must be looked to and fed." After some discussion the two hired men and the old squire went to the farm with the horses to feed them and to bring back some supper.

The Song of the Lazy Farmer

what next year is all about. A man who fails to use his head will likely wind up in the red, for luck is fickle, in the end it doesn't pay us to depend on luck to bring us out on top, for just as likely we will flop. So while we're buried in the snow, I listen to the north wind blow, and figger, while I'm sittin' here, to make a lot of cash next year!

ANOTHER year is comin' up and I feel frisky as a pup; of all the years that I have seen since I was old enough to wean, the one ahead is always best, I wouldn't trade it for the rest. No matter what your state or age, it's always nice to turn the page, and out ahead there stretches clear, for us to make or mar, a year that no one's touched, it's there for us to make our mark or make a muss. Its opportunities are there, enough for us to use and share, a challenge to the best we've got, we make the most of it or not, according to the way we step into our task with lots of pep.

In winter time I like to plan next season's work, the hired man will have it for his task to do, but what we have when he is thru depends upon the plans I make, and so on winter days I take a lot of time to figger out just

As the evening drew on the wind died away, and we kindled several fires on the other side of the sleds. About midnight, the old squire and one of the hired men returned with some food.

At daylight the old squire sent Halstead and me and the hired man home, to bring more food and the teams. The weather had moderated somewhat, but he told us to collect every blanket and coverlet that the old farmhouse could muster and to bring them back.

We returned with a miscellaneous assortment of household gear, including old coats, cloaks, rag carpets, and two disused feather beds! We covered the potatoes with them, and shortly before eleven o'clock made a second start. Thus protected the potatoes safely made the journey to the railway

station. Once we got them aboard the heated cars our worry ceased.

The old squire went to Portland by train the next morning to attend himself to the delivery of the consignment. He received the amount that had been agreed upon, — two dollars a bushel, — but the total sum was one hundred dollars less than he had expected. For, in spite of our efforts, about fifty bushels of the potatoes at the bottom of the loads had frozen.

Afterwards, too, one of the Portland dealers told the old squire that one or two of his customers had remarked that those potatoes seemed to have an odd, faint smoky smell that they could not account for! The dealer laughed heartily when the old squire told him how those potatoes got to market.

The A.A. Cooking School

(Continued from Page 25)

and water, usually in amount equal to the white sauce, is combined with it. If necessary to hold over a little while before serving, set in a pan of hot water to prevent scorching. Asparagus, carrots, cauliflower, celery, corn, spinach, green peas and tomato make delicious cream soups. These too, should be served for lunch or supper where the meat, if any, is a light one.

Garnishes suitable for cream soups are buttered popcorn floated on corn soup, chopped parsley on potato soup, croutons (diced bread, browned) and shredded toasted almonds on any of them.

Clear soup or bouillon is served with a heavy meal. It is a soup every woman should know how to make even though she may not do it often. But because it takes time and all solids are strained out, I am giving here a recipe for a combination soup which most people will use much oftener than the bouillon:

Meat and Vegetable Soup

Select a beef bone or knuckle of veal and have the bone cracked to get out all the good flavor and nutriment. Wash the bone and be careful to remove any small slivers. Put the bone in a large kettle, cover with water, and simmer for 2 to 3 hours, or until the meat is tender. In the meantime chop 3 or 4 onions and 3 or 4 stalks of celery and add to the broth. Also add a No. 2 can of tomatoes and 1 quart of diced vegetables, such as carrots, turnips, and potatoes. Simmer gently until the vegetables are tender, but not broken. Season to taste with salt and pepper. Serve the meat with the soup, either left on the bone or ground and add to the soup. Or save the meat to make hash or croquettes.

To make even more substantial soup add rice, or short pieces of macaroni

or spaghetti, or pearl barley, or cracked wheat.

Bean or Pea Soup with Cured Pork

Wash one-half pound of dried beans or peas and soak overnight in about 1 quart of water. Wash and scrape a ham hock, put into a kettle and add water to cover. If the meat is very salty, change the water several times. Simmer until the meat is tender; if convenient, allow the hock to cool in the pot liquor. Skim off the fat.

Cook the soaked beans or peas in the pot liquor which has been diluted with water until it does not taste too salty. Add a chopped onion. When the vegetables are soft, press them through a sieve. To the soup stock add the sieved vegetable, together with some of the pork, chopped. Mix thoroughly. To give the right consistency, add a little flour mixed with cold water and cook for a few minutes, stirring constantly. Add salt if needed.

Cream of Tomato Soup

4 tbsp. butter	1 clove
4 tbsp. flour	1/4 tsp. celery seed
1/2 tsp. salt	1/4 tsp. soda
2 c. milk	1 tbsp. minced onion
1/2 bayleaf	2 c. canned tomatoes

Melt 2 tablespoons butter, blend in 2 tablespoons flour and 1 teaspoon salt, add cold milk. Meantime combine tomatoes, half teaspoon salt, the bay leaf, clove, onion and celery seed, and thicken with 2 tablespoons butter and 2 tablespoons flour blended together. Strain, add the soda and combine with the white sauce. Serves six.

Non-acid vegetables do not require the soda. Where possible, 1 cup of the pulp or diced vegetable may be added to the white sauce and vegetable water mixture.

Wins Life Saving Award

TEN-YEAR-OLD Sylvia Hayes of Willsboro, Essex County, N. Y., is the latest winner of an *American Agriculturist* Life Saving Award. Last summer nine-year-old Isabel Jones became frightened while playing with a number of children at Tier's Beach on Lake Champlain. Not an expert swimmer, she became panic-stricken and sank in 7 ft. of water. Sylvia, who is an excellent swimmer for her age, went to her rescue and kept her afloat until an adult was able to swim out 300 ft. and bring her into land.

After the rescue Sylvia said, "Now, Isabel, stay in bed today, and tomorrow you will be as good as new." For this courageous action, unusual in one so young, *American Agriculturist* has presented one of its framed Life Saving Awards. It reads as follows:

AMERICAN AGRICULTURIST
LIFE SAVING AWARD

Presented to Sylvia Hayes

Who, at the age of 10 years, saved 9-year-old Isabel Jones from drowning in Lake Champlain.

Signed:

(Seal) E. R. Eastman, Editor.

H. L. Cosline, Associate Editor.

"Have a good time at Gran'ma's, and remember not to eat like a hog."

Interest Centers High This Season

NECKLINES take on new interest this year, rarely conforming strictly to the old V line. Numerous clips and jeweled ornaments enhance the interest of the richer fabrics used for afternoon and evening dresses, while for daytime wear the tailored effects are favored.

DRESS PATTERN No. 2809 is excellent made in black satin, which is scoring high in favor. This model is flattering either to mother or daughter and may be made in street or formal length, belted or sashed, in long or short sleeves. This highly useful pattern may be had in sizes 14, 16, 18 and 20 years, 32, 34, 36, 38, 40, 42, 44, 46 and 48 inch bust. Size 36 requires 3 1/2 yards of 39-inch material for street length dress.

DRESS PATTERN No. 3433 with its youthful shirt bosom allows smart fabric contrasts in patterned and monotone crepe. Plaid rabbit's wool with vestee in matching plain color would take the schoolgirl anywhere. Pattern sizes are 12, 14, 16, 18 and 20 years, 30, 32, 34, 36, 38 and 40-inch bust. Size 16 requires 3 1/2 yards of 39-inch material with 3/8 yard of 39-inch contrast for vestee. Embroidery pattern E-706 for decorating tab on vestee is 15c extra.

TO ORDER: Write name, address and pattern size and number clearly and enclose 15c in stamps. Address Pattern Department, *American Agriculturist*, 10 North Cherry St., Poughkeepsie, N. Y. Add 12c for one of our Fall and Winter Fashion catalogs.

Today in Aunt Janet's Garden

BEING miles from a florist and with no blooming plants in the window need not discourage anyone who wants a pretty centerpiece for her dining table, provided she has access to woods. It is merely a matter of knowing what to look for.

A short time ago, I called on a friend whose house is surrounded by woods. She was to entertain guests from the city at dinner that evening and she showed me the very attractive centerpiece which she had arranged on her dining table. She remarked that flowers from the florist would be entirely out of place in her type of house, so she went to the woods to see what she could find. A flat, round pewter plate was placed in the center of the table, and on this a low bowl in which a few trailing vines and colorful leaves were placed.

The same idea might be used with variations as to container and growing material. The more delicate vines or small material would look well in metal, either silver or pewter, whereas heavier berried twigs or branches would look well in sturdier containers of pottery or even wood.

Truly there is no dearth of material if one only looks for it.

"What, No Suet!"

By MRS. G. H. E.

*Our Downies are like as pea to pea,
We can't tell one from t'other,
Except there's red on one toupee
And there's none on the other.*

ONCE there was a little old woman who lived in a cottage at the foot of a hill. She liked birds and always put out suet for them in the winter. A big maple tree stood near her window and on its ample trunk she fastened the food securely under a wire. Jays

and chickadees, nuthatches and woodpeckers shared her bounty and she was never lonely.

"Suet, suet", remarked Downy as he alighted on the maple trunk for lunch one stormy day.

The little old woman glanced out of the window and, to her dismay, saw that the suet was gone. She blamed the cat, but what could be done about it? There was no more suet to be had until the next day.

Downy cheerfully cleaned up the scraps and flew away. But when he returned a little later and found no lunch, he seemed to say "cheat, cheat" instead of "suet, suet."

His hostess remembered a piece of bacon rind in the cupboard. Perhaps that would serve in this emergency. So she slipped into her galoshes, put a shawl over her head, and bacon rind in hand went out to the feeding station. She could hear Downy scolding in the plum tree as she fastened the rind on a nail under the wire, and she hadn't been in the house five minutes when back he came and went busily about his lunch, saying "sweet, sweet" between each bite.

Northeast Markets for Northeast Producers

For Type and Milk Production

Buy Your Next Herd Sire From THE WAIT FARMS

Leading our association for milk and butterfat production 9 year average.

Bull calves of all ages for sale, including several old enough for service. Prices reasonable.

Half Time Home of Cornell Royal Blend

DAM—"Cornell Ollie Catherin", first prize aged cow, senior and grand champion at Nat. Dairy Show 1938. Reserve All American aged cow 1937. Reserve All American 3 yr. old 1934. Made 733.7 fat as 2 yr. old in B, 746 fat as 4 yr. old, and has just finished in mature form with over 29,000 milk, 1,160 fat, average test 4%.

SIRE'S DAM—"Cornell Ollie Pride" was All American 3 yr. old 1933. Reserve All American 4 yr. old 1934. As 2 yr. old broke national records in class B for 305 days, finishing year with 772.1 fat. Made 894.1 fat at 5 yrs. and finished her mature record with 1,079.1 fat, 25,304.8 milk, average test 4.3%.

Cornell Royal Blend is proving himself to be a wonderful transmitter of type. One of his first calves was 1st prize heifer calf at the National Dairy Show, also 1st and jr. champion at the N. Y. State Fair 1938. Sold out of bull calves at present but will be glad to take orders, several great cows and daughters of our 911 lb. fat 4% "Snow" bull to freshen soon.

HERD FULLY ACCREDITED AND NEGATIVE.

C. C. BENNETT, HOMER, N. Y.

Judge Orbel making his final selections at the Lamb Show in Buffalo, with Kenneth Simpson, Caledonia, N. Y., at the extreme left, and the eventual winner, Carl Botsford of Scipio Center, N. Y., is in second place. Arthur Breiner, Churchville, N. Y., in third. Russell Sindon, Ripley, N. Y., is fourth. Edmund Knapp, West Falls, is fifth.

Earlville Sale

The 100th Anniversary Earlville Sale was an unqualified success. It is estimated that around 1,000 people attended. A total of 147 head of Holsteins were sold for \$41,760, making an average of \$285.

One barber in Earlville reports that men from 16 different states and Canada came into his shop.

Eleven cattle went to the State of Oklahoma, including a nine-year-old cow, sold for \$660; one of her daughters, sold for \$675; and two other daughters, sold at \$475 each.

The first Earlville Sale was held May 14-15, 1924, and since that time 10,983 cattle have been sold for \$1,585,419.

Kernels, Screenings and Chaff

By H. E. BABCOCK.

AS WE COME to the end of 1938 I find myself more or less unconsciously taking inventory. Inventory not only of my physical possessions but of jobs completed and, most important, of those interests in my life which make me look forward to the coming year with anticipation.

Looking back over the last three years at Sunnysables I feel sure that I can recognize definite progress in the development of ideas and in their application. On the chance that you will be interested I am going to review some of the things I have worked on and written about and, if space permits, set forth some of the problems which challenge me in 1939.

All-Grass Farming

The safest farm to run during periods of falling prices in the Northeast is an all-grass farm. For this reason we have been interested in developing a rotation for our Sunnysables and Larchmont farms which will permit us to maintain them as nearly one hundred per cent in grass as possible. *The reseeding practice we have developed is to cut the grass on fields which need reseeding early in June; put this grass in the silo; plow the field; and sow soybeans. We cut the soybeans seventy to eighty days later and put them in the silo and then without plowing reseed the field to hay with some winter grain like wheat or barley.*

Under the above plan we hope there will be years when it will not be necessary to do any plowing at either Sunnysables or Larchmont. When there is a chance to make a little money growing cash crops and grain, our plan is to grow these on leased land with the idea of giving up our leases whenever it seems advisable to contract our operations. This plan gives us abundant hay and pasturage on our home farms, some hay and pasturage on leased farms and all the acreage of cash and grain crops we care to grow when we want to grow them.

Hay Silage

We were first attracted to grass silage because of the difficulty of handling the hay in time on farms which were all in grass. We have become hay silage converts because we can put it up so much more cheaply than we can grow corn for silage, and because we like to feed hay silage a bit better than corn silage. *Our development of a truck with which one man can mow, load, and draw all the green hay that two men can poke through a big hay chopper has proved to be the key to the successful and economical making of hay silage which itself is the key to all-grass farming.*

We like the phosphoric acid method of making hay silage and shall continue to use it, but we have no quarrel with those who prefer the molasses method.

Whole Corn for Hens

We now feed whole corn to all our poultry after the chicks are six to eight weeks old. While we know that our statement is refuted, we are still pretty firmly of the opinion that cracking corn is a useless expense for poultrymen. *We also feel that the practice*

tends to rob the poultry of the Northeast of a considerable percentage of the corn germ.

If you haven't tried feeding whole corn, from our experience we believe you might find it profitable. Hens, however, must be trained to eat it as chicks.

Crossbred Poultry and Livestock

We have standardized on crossbred hens produced by mating Rhode Island Red roosters to Plymouth Rock hens. We are convinced that these birds live better than any purebred strains, at least any that we have ever had. They also lay very satisfactorily and were the first birds that we were able to get the cost of producing a flock out of when we sold the old birds as yearlings. The two chief handicaps these crossbreds have are a tendency to broodiness, which we have learned to handle with a minimum of loss of production, and the fact that they lay unevenly shaded brown eggs.

We have also standardized on crossbred Dorset Merino ewes for early lambs. We are convinced that we can make more money out of this type of ewe than we can out of any straight breed, and we have tried three. They, too, have an unusual vigor and, in addition to a tendency to lamb early, are great milkers and mothers.

We expect to standardize on crossbred pigs. However, we have not yet had enough experience with our crosses to be sure which one we want to use.

Up to the present we have done very little crossbreeding of cattle. We are now carrying purebred Guernseys, Angus, and Herefords. We would like to try to produce a crossbred dairy cow and our experience convinces us that there are possibilities along this line.

Frozen Farm Foods

Another interest which is beckoning me into 1939 is frozen foods. *I am convinced that one of the safest and sanest things that farmers in the Northeast can do is to pay more attention to feeding their families and their relatives in town on farm-raised meats, fruits, and vegetables.* I am just as convinced that the key to doing this is some form of community quick-freezing service supplemented by cheap cold storage.

I am not at all sure that the standard freezer-locker plant which is being promoted largely by the manufacturers and sellers of refrigerating equipment is the answer. For one thing, I don't like the idea of having the cold storage lockers all at a central point, which means that farmers, if they are to make use of these lockers, have to continually run back and forth between them and their farms. For another thing, I am not at all sure that the present refrigerating equipment is as completely developed as it should be for the job.

I am personally, however, going to get all the experience I can with the quick freezing of my own farm-grown fruits, vegetables, poultry and meats, and I am going to experiment with the storage of these frozen products right at home in boxes which will maintain zero or below temperatures.

Just to prove that we are not merely academic in this interest, I can report that we now have in our zero box the frozen cuts from two spring lambs, a yearling sheep, a two hundred and fifty pound hog and half of a four hundred pound steer carcass; also nineteen turkeys, and two dozen chickens. In addition, I have purchased and stored in this box frozen sweet corn, cherries, and beans.

Winter Barley

We are now having our third year's experience with winter barley. We have raised good crops for two years. As I have reported here before, we have eliminated those strains of winter barley

As we have increased our production of high-quality meats we have found it more and more necessary to do our own slaughtering in order to get the prices we believe our stuff is worth. Here are two views of the hind quarters of an Angus steer dropped in October 1937 and largely grown out on grass. Three such steers topped the holiday market and averaged to bring us a little over \$90.00 apiece.

which had weak straw and barbed awns. *I am not yet prepared to say that the strain we are growing will stand our climate and give good yields,* but one of the reasons that 1939 is interesting is that it will throw some more light on the practicability of our growing winter barley.

Mustard Control

One of the reasons I am looking forward with keen interest to 1939 is that I am going to get in some good licks trying to control mustard. I suppose some people would think that such a problem is nothing to get excited about, but I must confess that I find it intriguing and challenging.

Cement Floors Above Ground

Six years have proved the soundness and worthwhileness of the cement floors on the second and third stories of our barns. These floors were built

by laying two inches of concrete on specially reinforced paper stretched over the floor joists. The floors have not cracked nor are they wearing to any appreciable extent. They are both ratproof and sanitary.

Truck-Tractor

Our truck-tractor is an excellent truck and a better than average tractor. It needs further development. For example, this winter we hope to install a power take-off in the rear end so that we can use the job in truck form to haul our light combine. We shall have some two hundred acres of grain to combine and we would like to draw the combine with the truck and shoot the grain from it into the truck. Possibly we are attempting to bite off too much, but last year at this time our idea of fitting the truck with a cutter bar for mowing hay was just on paper—and it worked out.

Conducted by H. L. COSLINE

"Trimmed"

If one were to judge by the name alone, it would be logical to expect a "fair" deal from any one living at Fairfield, Iowa. Unfortunately, some eastern stock buyers are likely to sputter out a few cuss words if you mention the name of that place to them. For some years now it has been known by some who have had experience and by some who have heard of that experience that a buyer of stock is likely to get trimmed if he doesn't watch his step when buying from some individuals in that area.

Here is about the way they work. They run advertisements in eastern weekly or daily papers, advertising cattle or other stock for sale. They have been cautious about using United States mails so when a prospect answers the ad and doesn't follow it up promptly, he is more than likely to get a 'phone call from Fairfield asking if he is still interested and agreeing to pay his traveling expenses if he will come out in person.

When the prospect arrives, he is shown cattle, the inference in many cases being that they were raised by the man selling them, or at least raised in the neighborhood. In the dickering that is sure to follow, the proposition comes up that if they sell the stock for a low price, the buyer ought to pay his own expenses; and usually if he buys quite a quantity of stock, the price is dropped some to make him willing to do so.

Quite commonly a good story is brought out to prove the necessity for immediate payment, for example, that an estate is being settled and in order to get the cattle at the price quoted, it is necessary to pay cash.

Secure in the thought that he has made a good deal, the buyer goes home. However, when the stock arrives, what a shock he has! The only resemblances to the ones he saw are that they have four legs and enough other characteristics to identify them as cows. What can he do? A guess is that the seller was anxious to get cash because he knew that he would never get full pay after the cattle arrived. Under those conditions it is a pretty difficult thing to prove fraud. There is not even a bit of correspondence on which to base a suit for damages.

It is claimed that the seller usually purchases these cattle on some livestock market, and that they represent what is left after everyone else has picked out what he wants.

There are at least two lessons that can be learned from this. First, keep away from Fairfield. It seems too bad that a relatively small group can bring this sort of a reputation to a town, but that is what has happened. The second lesson is do not pay cash until you get the stock. It is easier to settle a difference of opinion when you have the money than it is when the other fellow has it.

Glittering Promises

"Last spring three agents came here from a Building Concern to shingle our house. We told them we did not have the money, but they said they wanted it to show customers and would give us \$25.00 for every house they got to shingle within five miles of us.

"Since that time they have shingled houses all around us but we have not got a cent out of them. Besides that they agreed to put cork insulation under the shingles but they did not do it. We have to send our payments to St. Paul, Minnesota."

Promises of this sort are worth nothing unless they are contained in the contract, and even if they are contained in the contract, the ability of the subscriber to collect would depend upon the company's financial state. As we see it, this is merely an unfair argument used to sell the idea. Once

the shingles are on and the account turned over to a finance company, the concern that put on the shingles loses all interest. The account will have to be paid as legally, the finance company constitutes an innocent third party. If any satisfaction is to be secured, it will have to be by suit against the company that put on the shingles. We suggest checking to get prices from local contractors before signing contracts like this.

* * *

Where is Ghils?

About three years ago several complaints came in about orders given to agents of the Gillcote Coating Company which were never received. The agent signed the orders "A. Ghils" or "A. Gills." Letters sent to the address given were returned marked "unknown." We were unable to locate the man, and nothing more was heard until two more complaints came in. We have notified the State Police of New York and Pennsylvania to be on the watch for this man in order that we might have the opportunity of asking him about these orders. We would be glad to have information about him or any other agent representing this company.

* * *

Off Key!

A postal fraud order has been issued against the Columbian Music Publishers of Toronto, Canada. They advertised for original poems and songs. When a poem was accepted, the author was asked \$45 for which the concern would edit and set the poem to music, copyright it, and publish it in a "professional artists edition."

Some of the facts brought out in the investigation were:

1. Songs sent in were examined by an 18-year-old girl who was not a musician. She testified that out of 150 poems examined by her in one day, only 3 were returned.

2. Up to last June the concern had received over \$110,000 in fees for "servicing" songs, while authors had received only about \$200 in royalties.

3. A large proportion of the work of setting the songs to music was done by various people in Toronto who were paid \$3 per song.

4. An expert testified that 999 out of 1,000 songs accepted by publishers are the work of professional songwriters, and that a successful song is written by an amateur only in the neighborhood of once in 4 to 10 years.

Testimony was also given that concerns who undertake to publish amateur songs are known in the music world as "song sharks". The expert stated that he had never known of any amateur who had achieved success by having his song "serviced" by such an organization.

* * *

Incubator Rejects

Infertile eggs coming from incubators have a value of from 25 to 60 cents a case for use by tanners for tanning leather. If anybody offers you more than \$1 a case, you can be sure that the intention is to use them for food purposes. Certain clever groups are violating the law by breaking out these eggs and freezing them. It is evident that you, as a poultryman, would not care to eat such eggs, and there is no doubt but that it is a practice that will ultimately hurt the poultry industry.

I doubt if any hatcheryman would knowingly do this for a temporary advantage of a few cents a case. It has been suggested that a Federal law be passed requiring that eggs tested out of incubators be destroyed on the premises to help authorities to break up this practice.

OUR salesman, John Eliot, is standing by the wrecked car in which James N. Bradshaw of Amesbury, Mass., was injured. Fortunately Mr. Bradshaw had our limited travel accident insurance policy. After receiving his check, he wrote us as follows:

"Thanks for your check of \$30.00 which came in at a time when extra bills were piling up because of my accident. Because of this insurance money my first hospital experience was more pleasant."

"In appreciation of your prompt and courteous service, I will be glad to have you use this letter any way you wish."

eggs ...THIS WINTER

AND NEXT WINTER

WHEN the days lengthen, the cold strengthens. Cold weather makes heavy demands on a laying hen. With no direct sunshine or green feed, she has to get practically all her vitamins from the mash. Her feed must not only take care of her own bodily needs plus egg production, but must keep her warm as well. Poultrymen who are using one of the G.L.F. mashes—newly improved by the addition of manganese and extra Vitamin D—are doing a good job of “feeding for eggs” this winter. But far-sighted farmers are already thinking about next year’s eggs.

2. **THE CHICKS** are ready to eat 24 hours after hatching, though they can wait a day or two longer. Right from the start they need calcium and phosphorus to build bones, and Vitamin D so they can use the calcium. Starting & Growing Mash supplies them, along with the other necessary vitamins and minerals, a variety of proteins and carbohydrates. Special care in feeding chicks is well worth while, because they will be next winter’s layers.

3. **A FINE CROP OF PULLETS**, well grown, ready to lay, is something to look forward to next fall. The work of building such a flock starts now—with the breeders—and continues through the chick season. The feeds to do the job are available at G.L.F. Service Agencies. Open formulas are on the tag. Behind these formulas is the experience of college nutrition men and thousands of farmers.

1. **IT STARTS WITH THE BREEDERS**, who supply not only the blood-lines of the chicks, but the materials that build the chicks’ bodies and nourish them in the shell. Super Laying & Breeding Mash is built to do just that. The 25% increase in Vitamin D gives it a greater margin of safety even for very high producing, totally confined birds. W. S. Mapes of Middletown, N.Y., got 76% hatchability of total eggs last spring feeding this mash.

ARE DAIRYMEN FEEDING LESS PROTEIN?

A LOOK at G.L.F. Mills tonnage figures shows that since July 1, patrons have purchased exactly the same amount of 20% Exchange Dairy as they have of 24% Milk Maker. In the same period last year, Milk Maker tonnage was close to 5000 tons ahead of Exchange. The trend is even more marked in the super feeds. For every patron who uses 24% Super Milk Maker, four use 20% Super Exchange. In fact, the protein average of feeds purchased by patrons has dropped from 23% in 1930 to 21.8% last year.

Considering the fact that the higher protein feeds are frequently mixed with grains, it is likely that the average patron is feeding not over a 20% feed. Thus the protein experiment carried out at Cornell nearly ten years ago is now bearing fruit—most patrons are feeding just about as much protein as they need, and no more.

Another interesting fact shown by the tonnage record is that Milk Maker and Exchange represent more than half of all mixed feed purchased by patrons. Other approved flexible formula feeds make up

19 per cent of the volume; the fixed formula super feeds 13 per cent. The balance consists of special mixtures, pasture feeds, and market feeds.

NATALIE OF LEE’S HILL won the 1938 award as Reserve Grand Champion at the National Dairy Show held at Columbus, Ohio. She made 11,386 lbs. milk, 541 lbs. fat with 4.6 test in 305 days at two years of age. She is owned by Lee’s Hill Farm, Morristown, New Jersey who have a herd of more than 100 Brown Swiss. Lee’s Hill Farm have been G.L.F. feeders for over ten years.

In This Corner

Nothing tastes better on a cold morning than a stack of pancakes dripping with butter—unless it’s a stack of pancakes dripping with butter and maple syrup. A lot of farm women are keeping two bags of pancake flour on the pantry shelf this winter—Patrons’ Pancake Flour for the members of the family who like buckwheat cakes, Golden Blend Flour for those who don’t.

Last summer all G.L.F. Service Agencies were asked to send in photographs of farm houses painted with G.L.F. paint. More than 500 pictures came in. About 150 of them are reproduced on a poster which is now on display at all Service Agencies.

Cows, like all other animals, need salt. All G.L.F. dairy feeds except Super Exchange contain 1% salt, which is enough for cows getting liberal quantities of grain. But cows getting small amounts of grain should have more salt. They will take care of their own requirements if salt is placed before them.

Cortland G.L.F. Service extended its distribution of Family Foods into Texas when F. H. Scott of Fort Worth wrote in for 25 pounds of buckwheat flour. Mr. Scott, who became acquainted with the flour on a trip north two years ago, says he can’t find any buckwheat flour in the whole state of Texas to compare with it.

The Editor

COOPERATIVE G.L.F. EXCHANGE, INC.
Ithaca, New York

G.L.F. is a farmers’ cooperative. About 120,000 farm families in New York, New Jersey and Northern Pennsylvania are now purchasing all or part of their farm supplies through G.L.F. and many are also beginning to market farm produce through it. G.L.F. uses this page to help keep its members informed about their business.

AMERICAN AGRICULTURIST

FIVE YEARS FOR \$3.00 — THREE YEARS FOR \$2.00 — PUBLISHED EVERY OTHER WEEK

For Your 1939 GARDEN

by MRS. GRACE WATKINS LUCKETT

—Photo courtesy of W. Atlee Burpee Co.

An interesting story in plant hybridizing: the top flower is Burpee's new large-flowered red and gold hybridized marigold which was developed from the little French marigold on the left as the male parent and the big African marigold on the right, as the female parent.

EVERY YEAR I get a big thrill when the All-America list of annual flowers is announced. You will remember that these flowers are grown in twelve official All-America trial grounds in different parts of America, and those winning the highest rating are placed accordingly by the judges as winners of the gold medal, silver medal, bronze medal or honorable mention.

Seed from these varieties may be had from most prominent seedsmen, as the committee has more than once delayed the introduction of a variety in order to get a large enough seed supply for distribution. The gold medal winner for 1938 is Scarlett O'Hara morning glory. Don't let anybody fool you when they call it Ipomea,—that is merely its botanical name. This beautiful carnelian red morning glory is a native of the south, is named for the chief character in *Gone with the Wind*, and comes into blossom earlier than other morning glories. Its foliage being three-lobed is another difference.

Several flowers were placed on the silver medal list. The annual hollyhock, Indian Spring, brings a new race or type in this favorite old-fashioned flower. Being an annual, it blooms in four or five months from seed, and if one cuts away the central spike when it

has finished blooming, the basal branches will give a second group of its semi-double rosette-like pink crepy blossoms.

Hollywood Star petunia is a new thing in this popular family. Its flowers are really rosy pink stars with golden throats, its leaves narrow and elongated. This gives the plant an airy appearance so that it works beautifully into arrangements.

Salmon Glory is the name of the first separate variety of the new annual Gigantea phlox, which won an All-America award in 1935 for its mixture of art shades. The color is a soft, but rich salmon rose with large, creamy white eyes. Each individual floret is said to cover a half-dollar and under highly favorable conditions may be even larger. The plant grows 10" high.

The new strain of wilt-resistant China asters called Early Giants is represented on the All-America list

—Photo courtesy of J. Horace McFarland Co.

(1) Winner of Gold medal for 1938 —Morning Glory Scarlett O'Hara, a beautiful carnelian red morning glory which blossoms early. Silver medals went to Hollyhock Indian Spring (2), Hollywood Star Petunia (3), and also to Salmon Glory, the first separate variety of the new annual Gigantea phlox.

this year by its variety Light Blue. It grows 3 ft. high and is well branched. Its large 5 inch blooms of long, interlaced petals appear half a month earlier than other large flowering asters.

On the bronze medal list come Guinea Gold Antirrhinum or Snap- (Turn to Page 19)

IT DID HAPPEN HERE, PAGE 6—A LOOK AHEAD, PAGE 8.

Suited to YOUR CROPS YOUR SOIL YOUR CLIMATE

CHILEAN NITRATE is the only natural nitrate. It is guaranteed 16% nitrogen. And it also contains, in natural blend, small quantities of other plant food elements (see complete analysis in our literature sent free on request).

Many of these elements such as iodine, boron, calcium, zinc, copper, iron, manganese and magnesium, in addition to phosphorus, nitrogen and potassium, are necessary to plant life for normal good health, growth, quality and yield.

Therefore, Natural Chilean Nitrate is agriculturally valuable both as a source of nitrate nitrogen, and to furnish, or build up a reserve of other plant food elements naturally blended with it.

Use Natural Chilean Nitrate — take advantage of its quick-acting nitrogen and its many protective elements. It is well-suited to your crops, your soil and your climate.

CHARLES M. GARDNER
Editor of the National Grange
Monthly and High Priest of De-
meter of the National Grange.

THE HAPPIEST Juvenile Grange in New York State is Kirkland, No. 166, in Jefferson county, which had the honor of being the winner this year in the National Grange Achievement Contest for Juvenile Granges, and in consequence carries off the coveted first prize of \$20 in cash, besides a state prize of \$5.00 more. The matron of Kirkland Grange is Miss Muriel K. Sourwine of Redwood, and the good work she has done in training these Juvenile boys and girls is evidenced by the year's result in the contest.

THE YEAR'S SUCCESS in the Granges of Vermont is concisely summed up in the fact that out of 172 subordinate units in the state 53 made a net gain in membership during the past 12 months and 34 of these gained more than ten members. Besides the organization of three new subordinates, the reorganization of two and the institution of five new Juveniles, not a single Grange in Vermont was lost during the past year, and a net gain of better than 500 Patrons is recorded by the State Secretary, Miss Mary E. Priest of Randolph. Approximately 1,000 Patrons attended the annual State Grange session and a class of nearly 250 sixth degree candidates furnished further proof of Vermont Grange interest and enthusiasm.

A RECENT RALLY meeting at Portland, Maine, attended by more than 1,000 people from 20 different counties, was made the more noteworthy from the fact that 60 of the Patrons present were found to have belonged to the Order continuously for more than 50 years and in consequence were possessors of Golden Sheaf certificates issued by the National Grange for a half century of service. Several more such certificates were presented during the meeting and a further feature of interest was the fact that the presentation was made by the chairman of the executive committee of the Maine State Grange, William B. Deering of Hollis Center, who is himself the holder of a Golden Sheaf certificate. Maine has more Golden Sheaf members than any other state and additions to the number are being made almost every month.

THE GRANGE HALL at Simsbury, Connecticut, has a brand new floor

and other needed improvements in kitchen equipment as the result of the proceeds of the annual fair, which turned in the gratifying sum of \$165 net profit. Simsbury is one of the newer Granges in Connecticut, but has a live membership and has already made for itself a prominent place in its community.

THE 66th ANNUAL session of the Massachusetts State Grange, recently held at Boston, established a new "high" by a record attendance of 2600 members and a sixth degree class numbering 618 candidates. The Massachusetts State Grange has never started a year of greater promise than 1939, and a substantial membership gain is fully anticipated.

FEW GRANGE meetings in New York State last year have created more enthusiasm than an inter-county degree ceremonial recently held at the city hall in Hudson, in which the Granges of four counties participated—Rensselaer, Greene, Columbia and Dutchess. Four degrees were conferred in full form by these Granges:—First degree, Taconic Valley, No. 1538; second degree, Jewett, No. 1534; third degree, Chatham, No. 900; fourth degree, Fallkill, No. 882. Special interest attached to the ladies' degree team of Chatham Grange, making its initial appearance, and with all the ladies beautifully gowned for the occasion. The Pomona lecturers of the four counties prepared the literary program which followed the degree work—Mrs. Henry Carpenter of Dutchess county; Mrs. Charles Moore of Greene; Mrs. Marion Russell of Rensselaer; and Mrs. Nellie Rockefeller of Columbia; with Mrs. Jessie Prouty, Columbia county deputy, presiding over the exercises. Several officers of the New York State Grange were present and brought timely words of greeting, while the enjoyment of the occasion was greatly increased by a steaming hot supper served by the ladies of one of the churches in Hudson.

SADNESS PERVADES Grange circles in Connecticut because of the death of the Worthy Steward of the State Grange, Harold Kelsey of Middletown, which occurred after a fall into an unprotected elevator well in a business block in Middletown. Mr. Kelsey was one of the most promising young men in the Connecticut Grange field, had a state-wide acquaintance and was held in high esteem by all his associates.

JUVENILE GRANGE workers throughout the land will be gratified to learn that the recent National Grange session at Portland, Oregon, provided for a ritual service of dedication for Juvenile Grange halls or rooms, and such a service will be ready during the present year. Several Juvenile Granges have built halls of their own, while many others are given quarters in the regular Grange building and the proposed service will be made to fit in either of these cases.

"Cy thinks they ought to be ready fer market next week."

Double Crossed SEED CORN

By H. L. COSLINE

CORN planting time will be here almost before we know it, and to most farmers in the Northeast, that means silage corn. More than any other one thing, the cost of a ton of silage depends on the yield per acre. In the past few years efforts to develop a better silage corn for the Northeast have stimulated the development of double-crossed corn, the most noteworthy variety to date going under the name of 29-3.

An average of 7 years' figures at Cornell shows that 29-3 produced 12 per cent more total dry weight and 61 per cent more grain than one variety of silage corn with which it was compared. Because the production of double-crossed seed is a time-consuming and costly process, this seed sells for considerably more money per bushel, but figured on an acre basis, the cost is low when compared with results. For example, one test showed that each additional bushel of corn resulting from double-crossed seed actually cost 4c. That is cheap feed!

This year in New York State about 70,000 acres will be planted to 29-3, and an additional 10,000 acres will be planted in New England. It takes a lot of cultivating to cover 80,000 acres but the figures are less impressive when we remember that the Northeast grows some three-quarters of a million acres of silage corn. But the important thing is not the acreage but the rapid increase in the use of 29-3 which has been starting.

This variety is particularly well suited for growing silage in New York State and New England. True enough, where the elevation is below 800 and 900 ft., it will mature for grain, and in especially favorable seasons it may mature at higher elevations. In time we may have a double-crossed corn for grain that is suitable for higher regions. Practically every Experiment Station in regions where corn is grown is breeding double-crossed corn, but in general the resulting seed is adapted only to the region in which it is produced.

One fact must be remembered. When you plant 29-3 corn and observe the beautiful ears which are produced, you may be tempted to save that corn for seed. Don't do it! Just to see what would happen, it has been tried, and an average for two years showed that production dropped from 54.7 bushels to 37.4, with a corresponding drop in tonnage.

The production of double-crossed seed corn is an Experiment Station and seedman's job and always will be. To protect the buyer, fields growing 29-3 seed are frequently inspect-

Hand-pollinating an ear of corn. The ear has been bagged to prevent cross-pollination. Every kernel on the ear has its own silk, and at least one grain of pollen must be deposited on every silk in order to produce a perfect ear of corn.

ed by state inspectors, and the seed itself is certified in New York State by the New York State Seed Growers Association and in other states by similar agencies.

You may be interested in knowing how this seed is produced. You will find a diagram on this page helpful in understanding the process. Let's take 29-3 as an example. Referring to the diagram, we can call inbred plant A Bloody Butcher, inbred plant B Cornell 11, inbred plant C Onondaga White Dent, and inbred plant D Luce's Favorite. Those are the four varieties from which 29-3 originated. These four varieties were inbred for a number of years. (five is the minimum). By inbreeding we mean that each ear was bagged to prevent cross-fertilization, and then fertilized by hand with pollen from the same stalk on which the ear grows. This produces a small plant and ear, but the result is a strain

A diagrammatical explanation of the production of double-crossed corn. For explanation, read story on this page.

LUCE'S FAVORITE'S GRANDCHILD

IN 1916, when I started as a green county agent in Delaware County, New York, I spent much time in interesting farmers in a new silage corn called "Luce's Favorite." It matured better and gave more dry matter or actual feeding value per acre than other varieties which grew much larger.

But time marches on, and there have been changes in silage corn as well as with everything else. The latest development is double cross silage corn, which Mr. Cosline tells about so interestingly on this page. One of the things that interested me about 29-3, the best variety of this inbred corn, is the fact that one of the varieties from which it was bred is "Luce's Favorite," a variety which was good enough to stand the test of years.—E. R. Eastman.

Here is what happens when you save your own seed from a field of 29-3. Figured on the basis of grain, the 29-3 produced 54.7 bushels, and seed planted from it produced 37.4 bushels. 29-3 must be bought from a seedsman every year.

which will breed true. There is little or no variation in plants.

The next step was to cross inbred A and inbred B by planting each variety in adjacent rows and pulling all of the tassels off inbred B. It is essential that the field be at some distance from any other corn, and the result is that the ears on inbred B are pollinated from pollen grown on inbred A. Likewise inbred C and inbred D are crossed, the resulting ears being spoken of as single-crossed seed.

The next year the process is repeated (see diagram), and the ears growing on the B x A cross are sold to farmers under the name of 29-3.

It sounds complicated and it is complicated. That is why double-crossed seed costs more money. The College or Experiment Station takes responsibility for inbreeding the four original varieties and crossing them. The resulting seed is sold to commercial seed growers, who produce the seed under inspection and sell it to farmers. If you want to try this corn, it is none too early to order seed. The supply is limited.

Do You Want the Rogers-Allen Law Destroyed?

THE "anti-everything gang" are out to hamstring and destroy the Rogers-Allen law, including the milk marketing agreements and the bargaining agencies which are dependent on this law.

If you want to save this law, which has come nearer to giving dairymen "a living price for milk" than they have had in a long time, sign your name and address to the petition that follows and send it to *American Agriculturist*, Ithaca, New York. We in turn will forward it to the Legislators at Albany.

The anti-farm gang consists of a few lawyers, a few politicians, a few milk dealers, and one or two publishers. It's the same old anti-gang that, for years, has fought everything good for farmers, and who profit by keeping farmers apart and stirred up. This gang is trying to break the Rogers-Allen law through the courts, and they have also tried to get the law repealed or destroyed by holding a meeting in Albany in order to make the legislators think that farmers do not want this law. *If you do want it, you must stand up for your rights.* It will take you but a few minutes to sign your name and address below, cut out the coupon, and return it to *American Agriculturist*. If you wish, write a letter too.

I most emphatically believe that the Rogers-Allen Law, the milk bargaining agencies, and the milk marketing agreement, based on this law, should be given a fair trial, and respectfully request the Legislature to leave the Rogers-Allen Law in its present form.

Name

Address

H. J. Baker

H. J. BAKER, for sixteen years extension director of agriculture and home economics in New Jersey, and engaged in agricultural education for more than 25 years, died suddenly on Friday, January 6, while attending a dinner of the annual New Jersey Extension Service Conference.

Born and reared on a farm in Delaware, Mr. Baker graduated from Massachusetts State College, later became first extension director in Connecticut, and left that position to assume a similar one in New Jersey in 1923.

The rapid growth of farm bureau and extension work, and the respect in which they are held by farmers, is largely due to the leadership of men like Baker. He was highly respected for his outstanding ability, and loved by all who knew him because of his fine and kindly personality. President Robert C. Clothier of Rutgers, in his eulogy of Director Baker, well summed up his worth when he said:

"We commemorate today a life of rare usefulness, the life of a man who has made his own rich contribution to the good of mankind. Never seeking his own advantage, he has devoted his talents and his efforts to bringing happiness to others."

What is a Weed?

EMERSON said: "A weed is a plant whose virtues have not yet been discovered!" If a weed like quack grass has any virtues, it is going to take a long, long time to discover them.

Put a Dish of Apples on the Table

AS I WRITE this, during the second week in January, one of the oldest and best farm organizations in America is in session at Rochester, the New York State Horticultural Society. This year the Society is emphasizing the high food value of apples.

Food and health authorities state that apples have even far more food and medicinal value than they get credit for.

Time was when every northeastern farm had its apple orchard. Disease and insect pests destroyed most of these, so farm folks in general now eat far fewer apples than they used to, and thereby lose an opportunity to prevent disease. Many people of this generation are cathartic dopesters. Some need a doctor's attention, but most of them could cure themselves by drinking more water (8 glasses a day), and by eating fruit, especially apples.

Apples contain pectin, which has the ability to take up a large amount of water, thereby forming a mass that stimulates necessary intestinal activity without injury to the mucous membrane lining. Fruit, and especially apples, taken with meat help to digest the meat by increasing the hydrochloric acid content of the stomach. Apples contain two very important minerals, iron and calcium and are good for the teeth.

In short, there is much truth in the old poem about the apple and the doctor, which dates back to early English days in old Devonshire in this early form:

Ate an apple avore gwain to bed
Makes the Doctor beg his bread.

These Boys Ask No Odds

THOSE who think that our young people are all going to the bow-wows should read the following letter from Dean Arthur L. Deering of the Maine State College of Agriculture. The letter so inspired me that I wrote Dean Deering for the privilege of passing it on to all our readers. The letter came as a result of *American Agriculturist* loan funds for northeastern young people trying to get an education in agriculture and home economics. As you know, any profits above funds necessary for publishing *American Agriculturist* are used for these student loan funds in Northeast colleges of agriculture and home economics. Here is Dean Deering's letter:

"You will be interested, I am sure, to know that another of the *American Agriculturist* loans has been paid in full. So far the loans from the fund have without exception been paid when due, which is, of course gratifying and makes it possible for us to assist a greater number of students.

"You will be interested in this little side light on a couple of our boys. They are living in one of the cabins where they can board themselves and also are working in the dairy barns, getting up at four o'clock in the morning to do the milking and then again doing the milking in the afternoon. They built the cabin themselves this fall, had no mattress on the bed, merely blankets, had no overcoats, just jackets—so, I thought, being unusually fine boys and good students, that they were justified in a loan of \$50 or more apiece. They have occasionally eaten supper with us at my home and on one of these occasions I suggested that I had funds that could be used as loans and if they desired a loan, it could be arranged without difficulty. You can imagine my surprise when they said, 'We knew of this fund and that you had some money, but had decided that we could get along all right without borrowing.' In fact, one of them said, 'We are helping one of the other cabin boys.' When I inquired how they were helping this other boy, I was

told that they had hired him to wash their dishes for them!

"So you see, Ed, how resourceful and independent some of our Maine Yankees are. Of course, I am glad that these boys can see their way clear to get by without borrowing money. There are others who are not so favorably situated from the standpoint of employment. These others greatly appreciate this assistance that the Foundation is making available to them."

Do You Want to See Europe?

EVER SINCE *American Agriculturist* started its famous tour service for its readers several years ago, we have had requests to organize a tour to visit Europe. Well, as our hired man used to say, "we have gone and went and done it!"

Cooperating with the Travel Service Bureau, Newton Center, Massachusetts, and Canadian Pacific Steamships, we have organized a very carefully planned European trip. This trip will contain the same features which have made *American Agriculturist* tours famous. Our friends will be relieved of all travel responsibilities and worries, the one price will cover all expenses, even the tips, and that price is so reasonable that many will be able to make their lifetime desire to see the world come true.

The time will be next August, and the trip will include Scotland, England, and many other European countries. If you have been hoping and planning for years to cross the Big Water, here is your chance. You owe it to yourself to learn the details about this *American Agriculturist* tour before you sign up with anybody else. Write Tour Editor, *American Agriculturist*, for full information, and watch coming issues of *American Agriculturist* for interesting descriptions of places which we will visit.

*Beneath a spreading chestnut tree,
The village smith he snoozes.
No nag since 1923
Has been to him for shoes.*

Eastman's Chestnut

THE FOLLOWING was sent to us by a friend, who dared us to print it. We never take a dare, so here it is. Anyone who has ever had any experience in milking will have some sympathy for the poor hired man:

MILKING THE "SWITCHER"

By Hiram Corncob.

In most herds you will find some "critter" inclined
To always be "switching" her tail
She will "switch" and she'll whack and give you a smack
That will sting like an old-fashioned flail.
And no matter what scheme you may plan or may dream
Her tail will be flaunting in air
While the things you will say as she hammers away
Could never be offered in prayer.
Now our new "hired man" he concocted a plan
And speedily put it in play
An old tailor's "goose" which was lying round loose
He wired to her tail, so they say.
With a switch and a swing she hoisted the thing
And "sock!" it came down on his head,
He was knocked to the gutter and loudly did sputter
When we laughed 'till our faces were red.
So angry was he at our unrepressed glee
He bolted at once for the door,
Where he halted to say "Just hand me my pay,
For I'll milk that damned critter no more."

These chicks were picked up promptly at the station, and the brooder house toward which they are headed is clean and warm.

DEAD CHICKS *Steal the* PROFITS

A Contest for Readers

TO THE reader who, in the opinion of the judges, best answers the questions on this page, will go a check for \$25. Second best answers will get \$10, third best \$5, and the next twenty \$1 each.

However, the real reason for this contest is to emphasize the importance of following a definite program if you want to avoid baby chick losses. Year after year some poultrymen succeed in raising a very high percentage of baby chicks. Others, either regularly or occasionally, suffer heavy losses that eat up a good share of the profits.

Here are some suggestions that may help you to win a prize. Everyone will want to draw on his personal experience, but new facts are being developed all of the time. Write your State College of Agriculture and ask for all available bulletins on raising chicks. Write to the Division of Publications, Office of Information, U. S. Department of Agriculture, Washington, D. C., and ask for a list of available bulletins. A charge of 5c each is made for these bulletins, and you can pick out those you think will be most helpful and send for them.

A good many catalogs issued by hatcheries contain a lot of valuable information. Most feed companies also publish bulletins on care and management of chicks. Ask your local feed dealer if he has such booklets, or look back through recent issues of *American Agriculturist* and see what advertisers offer them and write for them.

Most high schools having departments of agriculture have a reference library of books and bulletins, and your County Agent may have a supply of some bulletins for distribution.

It is worth while to have a good, up-to-date book on poultry in your library. A recent one is *Egg Farming* by Willard Thompson of the New Jersey College of Agriculture, published by the Orange Judd Co., 15 East 26th St., New York City, which costs \$2.

If you keep a file of *American Agriculturist*, you will find some pertinent information in the 1938 issues.

Here are the Questions

1. Two of the worst baby chick diseases are pullorum and coccidiosis. How can you tell these two diseases apart? Give treatment and prevention for each.

2. The following statements are taken from baby chick advertisements. Explain the meaning of each statement:

- "breeders blood tested"
- "pullorum clean; state accredited"
- "all breeders blood tested for B.W.D. by stained antigen method"

\$60. IN PRIZES

First Prize . . . \$25.00

Second Prize . . . \$10.00

Third Prize . . . \$ 5.00

Twenty Prizes of \$1.00 Each

For full details read rules and questions on this page.

(d) "all chicks produced from flocks tested for pullorum disease by official state testing agency of one of the six New England States with no reactors found; tube agglutination tested within the preceding calendar year"

(e) "100 per cent state tested (B.W.D. free) tube Agglut."

3. How does chilling affect baby chicks? Explain what steps should be taken to prevent chilling from the time chicks are ordered until they are one week old.

4. Following are ten statements. Some are true. Some are false. If statement is true, label "T"; if false, label "F".

(a) Chicks that get badly chilled or overheated

develop symptoms similar to those caused by pullorum.

(b) Coccidiosis is inherited.

(c) In general, the cheapest chicks are the best buy.

(d) "All breeders blood tested" is a guarantee that chicks will not have pullorum disease.

(e) It is essential that chicks get out on the ground.

(f) Heredity is the most important single factor determining how many eggs a pullet will lay in a year.

(g) Baby chicks should not be fed until they are 72 hours old.

(h) Overfeeding is a cause of heavy chick losses.

(i) A poultryman should order three chicks for every pullet he will need in the fall.

(j) Pullorum disease can be caught from other chicks or from dirty brooder houses.

5. What baby chick advertisement in this issue or in the January 7 issue of *American Agriculturist* appeals the most to you and why?

6. What is pedigree breeding and what is its value?

7. Assuming you are in the market to buy baby chicks, what information do you wish a hatchery to give in order to decide where to buy?

8. What is the cause of perosis (slipped tendons) in chicks?

9. How many baby chicks did you buy last year? How many pullets did you have in the fall? What changes, if any, are you planning in this year's chick-raising program?

10. List references read in looking up answers to these questions. If this information was found in *American Agriculturist* or other publications, list by pages and issues; and list by names bulletins and catalogs received from Colleges or *American Agriculturist* advertisers.

RULES

1. The editors of *American Agriculturist* will be the judges, and their decisions will be final.

2. Entries must be postmarked not later than February 20. Winners will be published in the issue of March 18. Address entries to: Baby Chick Contest Editor, *American Agriculturist*, P. O. Box 367, Ithaca, N. Y.

3. Ineligible to compete are persons connected with *American Agriculturist*, Extension Service workers, teachers of agriculture, or persons connected with a commercial hatchery.

4. Contestants or members of the immediate family must have raised 100 or more baby chicks in 1938, 1937, or 1936.

JUST HOW SMART ARE YOU *about tractors?*

(SMART ENOUGH TO SAVE YOURSELF MONEY NEXT SPRING,
IF YOU CAN FINISH THESE STATEMENTS CORRECTLY)

Make one choice under each statement

1. The tractor that set a new fuel economy record in recent official tests burned as a fuel:

- a. Stove tops c. Kerosene
b. Distillate d. Fuel oil
e. Regular-grade gasoline (containing tetraethyl lead)

2. As shown by tax rebate figures on gasoline used for non-highway purposes (consumed almost entirely on farms), gasoline used increased in 1937 over 1935:

- a. 49% b. 38% c. 26% d. 12% e. 2%

3. The new tractor announced recently with a Chrysler truck-type engine, which has a compression ratio higher than the average of automobiles, is manufactured by:

- a. Oliver c. Graham-Bradley
b. Minneapolis-Moline d. Massey-Harris
e. Silver King

4. A survey of Master Farmers shows that the next tractors they buy will be high compression in the following ratio:

- a. 1 out of 6 c. 1 out of 3
b. 5 out of 6 d. 1 out of 2
e. 2 out of 3

5. Three years ago there were no high compression tractors. Today the number of tractor manufacturers offering high compression tractors in standard or optional models at no extra cost is:

- a. 2 b. 8 c. 10 d. 5 e. 3

A TIP: Score yourself 20 points for each question answered correctly. (Answers given below.) A score of under 40 means you haven't been keeping up with the new developments in tractors. From 40 to 60 is good. Above 60 is excellent and probably means you're all set for profitable tractor farming in 1939 with a high compression tractor using regular-grade gasoline (containing tetraethyl lead).

Ethyl Gasoline Corporation, Chrysler Building, New York, N. Y. Manufacturer of anti-knock fluids used by oil companies to improve gasolines.

1. Regular-grade gasoline (containing tetraethyl lead).
2. a. 49%
3. d. Massey-Harris, Model 101. All companies named, however, make high compression tractors.
4. b. Five out of six Master Farmers said their next tractors would have a high compression engine.
5. c. Ten tractor manufacturers now offer high compression tractors in standard or optional models.

IT PAYS TO BUY GOOD GASOLINE FOR CARS, TRUCKS AND TRACTORS

MAN WITH CAR—\$30 WEEK AT START and rapid advancement supplying guaranteed Motor Oils, Soaps, Cleansers, Stock Remedies in big demand by farmers, dairies, institutions. Large established company pays best, promotes producers. Write Pres. LOYD'S OF AMERICA, Dept. J, Camden, N. J. Say you saw it in AMERICAN AGRICULTURIST.

FARM WANTED

FARM WANTED—Electric, near main road. Must have several cold, flowing springs or be on unfailing spring-fed stream at source. N. WILLSON, Phelps, N. Y.

IT DID Happen Here!

By E. R. EASTMAN

THE letter printed below, from a doctor practising in New York State, is one of the most remarkable and alarming letters I ever received. It is actual evidence that the statements I made in my recent article on happenings in the radical labor situation in other places can and are happening right here in our own Northeast. On receipt of the doctor's letter, I wrote and obtained permission to publish it. We are omitting, for obvious reasons, all names. Here is the letter. Read it and ponder:

"I have been an interested reader of *American Agriculturist* for the past few years, and particularly interested in the recent article that you wrote 'It Can Happen Here.' The truth of this article has been driven home to me within the past two weeks. My experience substantiates your prophecy.

"A few years ago I acquired a farm and moved to it, making it my home, but continuing my practice of medicine in the city. I bought a few purebred cattle and gradually added to them until I had a small herd. About a year ago a farmer friend of mine united with me in buying out a milk business, and we began to distribute milk.

"The farm barns were not ideal for dairying so it was necessary to do some remodeling and reconstructing. To do this, I employed some men who were not members of the carpenters union, but I gave no thought to the matter as it always has been customary for these men to work about farms and barns without any question of their affiliation with any union.

"Soon I heard indirectly that because these men who were working on my barns were not union mechanics, organized labor here had declared that the milk, part of which was supplied by my farm, was 'unfair' milk. The union members who bought this milk began to discontinue the use of it, under the plea that the union was forcing them to do so.

"I immediately contacted the union head and attempted to talk the matter over with him, explaining that the farm, by no stretch of the imagination, could afford to pay union wages on any remodeling or construction of farm buildings. I attempted to deal with him, promising that if he would leave the barns and the farm building alone and not demand union labor in their remodeling, I, in turn, would promise that any work done on the farm house would be done by union mechanics.

"The committee of his organization met me in my office and delivered me the ultimatum that it had to be all union labor on all buildings, including the barns and my home. The only recourse was to accept their decision or to continue with the ban of unfairness on the milk delivered in the city. The inference was also that the ban of unfairness would be exercised in my professional practice. It is quite obvious that farming is secondary to me, and I quickly decided that I would discharge the men and hire in their places mechanics from organized unions.

"It certainly went against the grain to have to surrender to such high-handed methods, but I could see no valid reasons why I should jeopardize my medical practice where my livelihood is earned by entering into labor

squabbles on the construction work done at the farm. It is quite obvious to anyone who knows farming that it is impossible to pay union wages for construction work done on farm buildings.

"I was very emphatic in telling the union leaders that their insistence on this principle would force me, for financial reasons, to stop my program of rehabilitating the farm and force me to give up farming. Their action puts me in a position that I can no longer afford to go ahead with the building program. I must disperse my herd at considerable financial loss. This side of the picture had absolutely no appeal to the union leaders. They only seem to be interested in a 'Rule or Ruin' policy. Giving up the farm will throw two or three men, now employed, on the already glutted farm labor market. Unions should be interested in labor problems, but apparently they are interested in no labor other than that involving their specific union members.

"I am in a rather peculiar position in that, practically speaking, I am not a full-time farmer. I feel, though, that if they can 'mow me down' as easily as they did, they can easily feel their strength and attack any other farmer who delivers any milk, as they have absolutely the same power over him as they have shown to me. In fact, in my conference with him, they intimated such a program.

"It becomes quite evident that now if the farmer is forewarned, he should be forearmed, and take some concerted action before it's too late. I hope you will pardon this lengthy letter to you, but I felt that with your intense interest in the matter, you would like some information about 'IT DID HAPPEN HERE'."

In a second letter to me on the same subject, Dr.—expressed this very fair point of view about the organized labor situation. He said:

"In our legislative bodies there are many rurally elected legislators who cannot be harmed by any labor vote. I am also confident that the labor lobbyists can have no favorable labor legislation enacted without the assistance of these same rurally elected legislators. I doubt very much if the real union leaders would want to see anything occur to antagonize these individuals in our legislatures. I feel also that if the real higher union leaders knew of these occurrences, they would take steps to prevent any repetition of them. In my opinion the actual union leaders have the vision and foresight to see the harmful effect that might ensue from antagonizing the farmers, which, in turn, would mean antagonizing the rural legislators."

I agree with Dr.—in this suggestion. *American Agriculturist* is not opposed, in fact we favor the right organization of labor. The laboring man certainly has a right to organize, and to deal collectively as does the farmer. What *American Agriculturist* as a whole and myself personally do oppose and will fight to the last of our resources is the kind of radical labor leadership that leads to attacks on farmers and farming.

New COW CHOW IS MAKING MORE MILK! say prominent dairymen

NOT ONLY more milk, but milk at *lower cost*. A lot of dairymen tell us they are getting more milk than ever before on the same number of cows. Many others have sold cows, put cash in their pockets for every cow sold . . . and are getting just as much milk as before with fewer cows and less feed.

These men saw the difference *New Cow Chow* makes in the milk pail because it's built to cut down on the work of digestion — leaving more net food value to make milk. Whether you feed *New Cow Chow* straight or mix it with your grain, this principle works. Try it and see — in just a few weeks.

Same Milk — 3 Tons Less Feed a Month

Milking 97 cows and producing 1,200 quarts daily for milk routes. Since changing to *New Cow Chow* I'm producing same milk on 6,570 lbs. less feed a month.

MILLER J. RHINEHART, *Lanesboro, Mass.*

2,700 Lbs. More Milk a Month From 20 Cows

On corn and cob chop, oats and *New 24% Cow Chow* we stepped up production 2,700 lbs. a month. Increase came in one month.

HARVEY & HOWARD WAMBOLD
Mainland, Pa.

5,719 Lbs. More Milk a Month from 12 Cows

My C. T. A. records show all this *extra* milk this October over October a year ago. Everything the same except *New Cow Chow*.

C. M. MORRELL, *Abingdon, Va.*

3,120 Lbs. More Milk a Month From 26 Cows

Just 4 months after going on *New Cow Chow* my 26 milking cows were up 1½ tons *extra* milk per month. Cows in better condition, too.

HAROLD TRIPP, *Pine Plains, N. Y.*

900 Lbs. More Milk a Month From 15 Cows

Was feeding my own grain and Old 24% Cow Chow. One month after *New Cow Chow* came out my production was up 30 lbs. a day on the same cows.

RALPH K. KLAMM,
Cottonwood Falls, Kans.

1,620 Lbs. More Milk a Month From 12 Cows

Changed to *New Cow Chow* November 1. In one month production was up 1,620 lbs. while most of our neighbors were losing milk.

F. T. and M. F. PALMER,
Skowhegan, Maine

In my office I have a Y. M. C. A. sign filled with shrapnel holes. It hung over our headquarters, which were destroyed by the Germans when they crossed the Marne on the night of July 14, 1918. I was down in a dugout underneath this sign.

ALL NIGHT LONG the bombardment was terrific. Then the Germans came swarming across the river. Some deep, serious thinking took place in that tiny dug-out of ours. Facing death caused us to live our lives over and over again.

Then our old regular Third Division, fighting with undaunted courage as they had never fought before, pushed the Germans back over the Marne. After that we were ordered into a rest area at Domremy (pronounced Dō-rāy-mē), the birthplace of Joan of Arc. Here, out of the roar of battle, we came into the peace and quiet of this little French village. One day as I walked about I went into an old church. A venerable Curé met me. In a soft voice he told me that I was in the church where Joan of Arc had once worshipped. He made her very real and blessed a little Joan of Arc medal, which I carried with me all through the war.

I caught something of the vision and courage of this peasant girl, who left her simple home in the country and led a whole French army to victory.

I began to dream bigger dreams. I saw her then as I can see her today, fighting gallantly at Orleans. I saw her at Rheims crowning a King. Then I saw her at Rouen, standing among the faggots as the flames licked up about her. She had been arrested, tried, and convicted on a trumped-up charge, and sentenced to be burned at the stake. Some 500 years later this hideous injustice was recognized and she was canonized and became Saint Joan.

♦ ♦ ♦ ♦

DOMREMY—Orleans—Rheims—Rouen —I've covered every step of the way. Joan of Arc is real to me, as I want her to be to you. She never took any glory for herself, declaring at all times that she merely served her God and her King.

When the little Chapel at Berea College was being built, I secured stones from all over the world to put into its walls. If you visit it you will see two small stones from Joan of Arc's church and also two pieces of wood shot through with worm holes which came from the house in which she was born. Beside these is the little Joan of Arc medal blessed by the Curé which I carried through the war. To me it seems singularly appropriate that these mementos should be placed in a chapel bearing the inscription: ASPIRE NOBLY, ADVENTURE DARINGLY, SERVE HUMBLLY.

Did Joan of Arc have to be at some great center of life before she could aspire nobly? Did she have to be in New York? Washington? London? Or did she begin in a rural community on a little farm just like hundreds of others in the United States? Joan of Arc began where she was.

It's not easy to break loose from the old tradition of staying at home and letting things drift. It's not easy to aspire as Joan aspired. Or dare as she dared. But it would be grand if now—particularly now—men and women on the farms of this country should rise, as Joan of Arc did, and dare to follow high aspirations, and live lives of real service right in their own community. Let's you and I develop Joan of Arc "stuff" in our lives.

1939 CATALOGUE now ready

A Look
AHEAD

EDITOR'S NOTE: The following statements are excerpts from "The New York State 1939 Agricultural Outlook" which is bulletin No. 400 of the New York State College of Agriculture. While written from the New York viewpoint, the majority of these facts and recommendations apply with equal force to all northeastern states.

"IN 1939 any material reduction in the total operating costs on individual farms must result from more efficient management. Feed prices are expected to continue low, and seed prices will be considerably lower than in 1938."

Dairy

"Feed prices in the early winter of 1938-39 are at the lowest level since 1932-33. Good yields plus a large carryover from 1937 resulted in an October 1 total feed-grain supply in the United States which was 4 per cent greater than that of the preceding year and slightly above the 1928-32 pre-drought average. Feed prices are expected to continue low throughout the winter."

"In the past fertilizer prices have usually fluctuated somewhat from year to year but the trend has been downward. Indications are that prices paid by New York farmers for fertilizer in 1939 will be about the same as in 1938."

"The long-time outlook for dairy farming depends upon the trend of the price level, because the New York farm price of milk fluctuates with the price level of basic commodities. Assuming that the Federal-State Order continues to be effective, New York dairy farmers will be spared a repetition of the disastrously low prices experienced in the summers of 1937 and 1938."

"The number of cows on New York farms has been increasing gradually since 1935, and some further increase is expected in 1939. With the cattle cycle now approaching a peak, dairy-men should guard against having an excessive investment in livestock."

Better Milk Price

"From August to September 1938, as a result of the Federal-State milk marketing plan, the average price received for milk by farmers in the New York milk shed increased nearly 50 cents per hundredweight. This increase raised milk prices from 16 per cent below to 13 per cent above the pre-war price. From August to September, the index of wholesale prices of butter declined 5 points to 86 and cheese declined 3 points to 74."

"In New York, the large number of yearling heifers reported on January 1, 1938, indicates a further increase in the number of dairy cows in 1939. For three years cow numbers have been increasing at the rate of about 2 per cent a year. However, the report for January 1, 1938, of 1,395,000 cows was about 40,000 below the number for 1933, and about 100,000 below the peak of numbers in 1920."

More Hens

"Poultry is becoming increasingly important in New York agriculture. Since 1880, the number of chickens in the State increased by more than two-thirds, and the trend is still upward. During the past seventeen years, the return per hour of labor spent on hens

SUGGESTED FARM ADJUSTMENTS

1. Establish a definite debt retirement plan. Reduce indebtedness as much as possible and re-finance the remainder at present low interest rates.
2. Obtain necessary credit from a credit agency. Commercial banks and cooperative credit agencies can furnish credit at less cost than can merchants and dealers.
3. Pay cash and buy in quantity. It takes more money to pay for things bought on credit than for cash.
4. Have an efficient-sized business. Over a period of years a farm business that is large enough to provide productive work for two or three men has paid better than the one-man farm.
5. Use labor more efficiently. An efficient size of business and high rates of production mean less labor per unit of product.
6. Get good yields of crops and livestock. One way to do this is to discard poor animals and poor acres. Another way is to use liberal amounts of commercial fertilizer and lime on the good land.
7. Avoid over-expansion in livestock. The purchasing power of both cattle and horses are near high points in their cycles.
8. Do more retailing. Retail prices of food are high as compared with farm prices.
9. Study and plan the farm business. One of the first steps towards putting a farm on a business basis is to take an inventory and file a credit statement.

on cost-account farms averaged 37 cents. This was 10 cents higher than the average of all important farm enterprises. Unprofitable years have been those when feed prices have been high as compared with prices of eggs."

Slightly Fewer Apples

"In the Eastern States, total apple production is expected to decline only moderately during the next few years. Low-producing orchards continue to be neglected. It is estimated that the hurricane destroyed 10 per cent of the apple trees in the New England States other than Maine where little tree damage occurred. An additional 15 per cent of the trees were damaged. These States produce 4 per cent of the United States apple crop."

Vegetable Acreage Up

"The total United States acreage and production of the most important fresh vegetables for market have approximately doubled since 1923. Per capita production of these vegetables increased from 61 to 98 pounds during this period. Both acreage and production in 1938 were the largest on record. Despite expansion in production, vegetable prices were well maintained until 1930. Since then prices have averaged about one-third below the pre-depression level."

"The United States acreage and production of the most important vegetables for manufacture have increased approximately 50 per cent during the past fifteen years. Production in 1938 was approximately 15 per cent below the record production of 1937. With average yields, 1939 acreages considerably smaller than the 1938 acreages for all important canning crops except tomatoes would give normal supplies for the 1939-40 season."

Fewer Potatoes Per Person

"Since 1905, the acreage of potatoes in New York has declined from 400,000 to 240,000 acres, while the United States acreage has remained relatively unchanged. Despite the reduction in potato acreage in New York, production has declined only slightly because

(Continued on Page 15)

These Things Endure

An original settler in New Braintree, Massachusetts, was Jacob Nichols. Early in the 1700's he built a log cabin on this site and the present house was built here in 1812. Each generation added comforts and conveniences as a fast progressing world brought new inventions. Present owners are Leroy and Helen Pollard. Leroy is the seventh generation of Jacob's descendants; his children are the eighth.

KING PHILIP and his Wampanoag Indians were most unfriendly neighbors when New Braintree was the frontier of Massachusetts. In the late 1600's he burned and sacked Brookfield, then known as Quaboag. His torch and tomahawk laid ruin to every settler's home west of Boston and Plymouth.

One of the first settlers to take up land after King Philip withdrew was Jacob Nichols. Through winding valleys and over forest trails he made his way northwest past Worcester and Quaboag. Partly for protection, partly because he liked the view, but more because he knew the land was good, he chose a site that overlooked rugged Massachusetts hills. He stopped in a section later known as Braintree Farms.

The trees Jacob Nichols cut, the stone he laid into neat stonewalls, and the log cabin he built on the hill were the foundation of a homestead which today—200 years later—is still home to the eighth generation of his descendants.

Jacob's land was stony and rough, but it made him a good living. Like his neighbors he raised a big family. Lucky they did. For when the dark days of the Revolution came, every father and son who could carry a musket was needed to fight for home, liberty, and independence. Several Nichols boys went. Some came back.

Not long did war oppress the New Braintree settlers. Early they found that their land and their climate was good for hay and pasture. New Braintree became a town of dairy farms, and remains so to this day. Its cheese brought the highest price in Boston.

So high, in fact, that cheese makers miles away took a long route to market to have their product labeled with the New Braintree mark.

By thrift and hard work New Braintree farmers prospered. They built sturdy homes of classic design. They built a stately meeting house and hired a good preacher. By good care and wise farming, they made their land more productive. Today the old Nichols farm carries 75 head of cattle and it could carry more on its 60 acres of mowing. Where it once produced beef, then cheese, it now produces milk for Worcester.

In 1812 Jacob's sons built a new house where he had set the first cabin. They were proud of its quiet beauty and its warm comfort; but its real test came three years later.

New England had grown to know just when to expect the latest frost and the first snow. But it had never seen an inland gale. In 1815, New England had a hurricane. Wind ripped up fences and trees, wrenched and ruined houses and barns. But the Nichols house, anchored to New Braintree rocks, stood out the gale. Exactly 123 years later it stood another—the hurricane of 1938.

Today's owners of the Nichols farm are Leroy and Helen Pollard. Their five children are the eighth generation of Jacob Nichols' descendants. Soon after Leroy bought out his father, the barn burned with the cattle in it. That was a tough blow. But neither fire nor hurricane licked his pioneer fathers, and neither has licked Leroy. His land, plus his hard

work and good management, is land that makes men free.

The history of New Braintree and its ancestral farm homes is the history of most towns in the Northeast. They cradled a democracy, the greatest free land in a troubled world.

Forgotten alike are the early defeats and the early victories by which we learned the lessons that time teaches. But the result and the reward are ours today to cherish, enjoy and preserve.

One of a series of articles published as

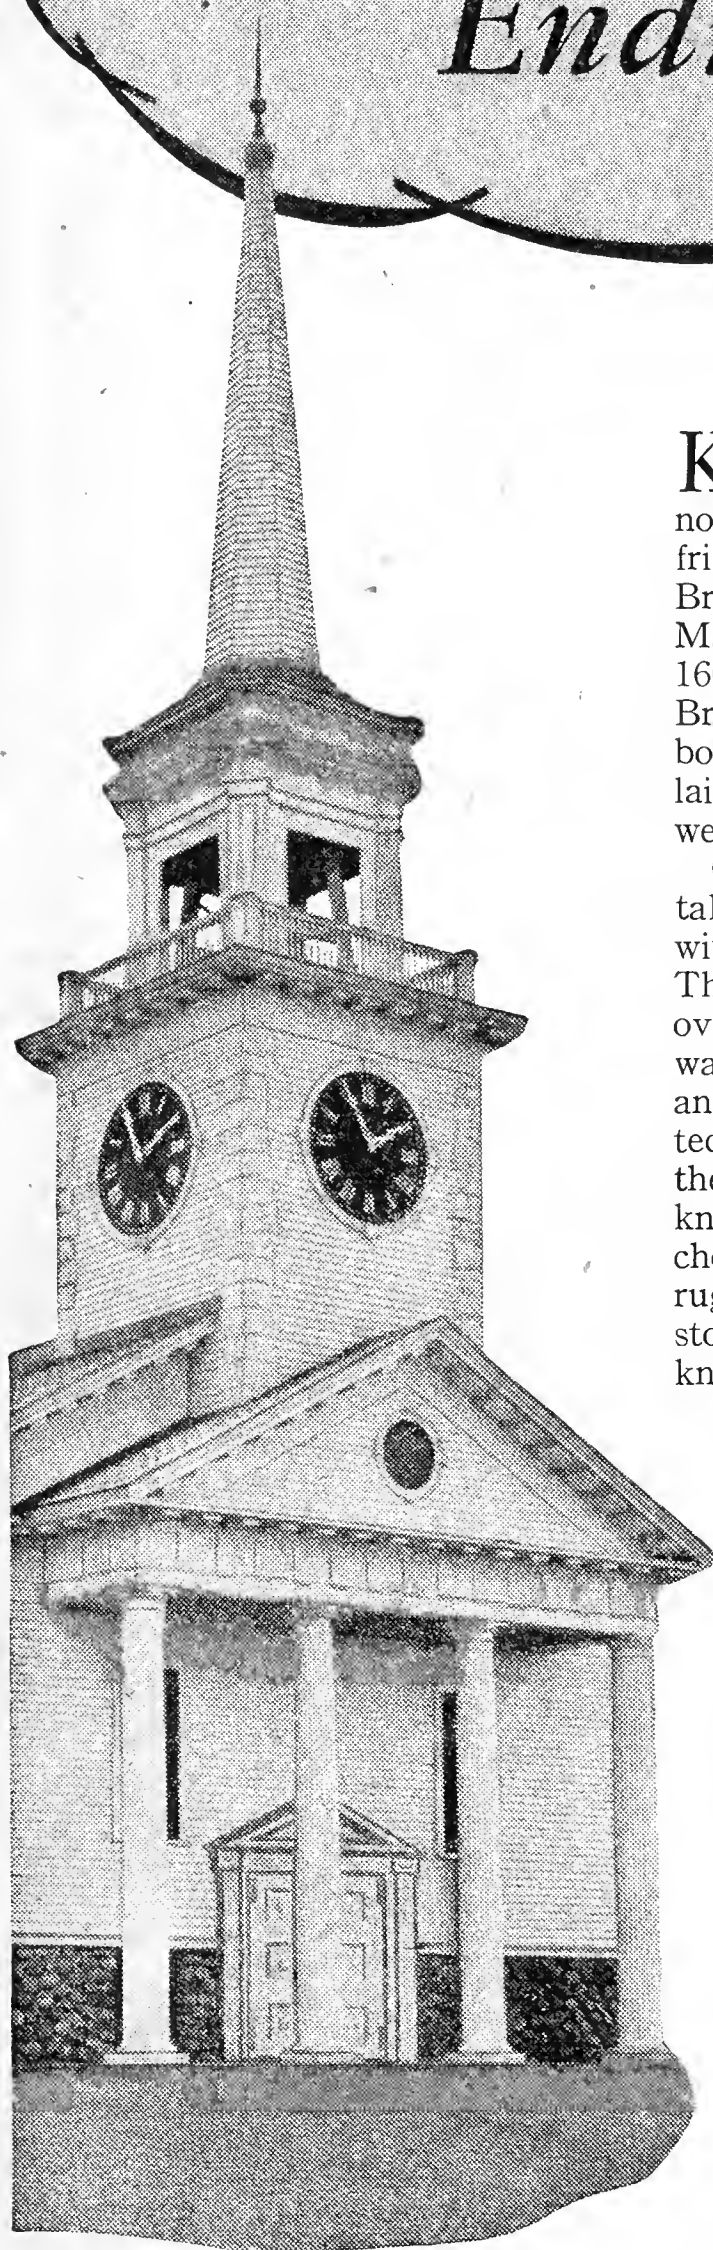

*An Expression of Confidence
in Northeastern Agriculture*

About half the farms of the Northeast are owned free and clear. The others are mortgaged; and the greatest risk to their owners is the chance of losing what progress they have made.

For some 30,000 farmers of New England, New York, and New Jersey, the Federal Land Bank of Springfield is providing a type of mortgage financing that gives the greatest degree of safety. Land Bank mortgages require only small payments in any one year; they provide for a long time to pay out, if it is needed; they don't come due in a lump sum and therefore don't have to be renewed.

"Safe Financing" is the name of a folder that describes these farm mortgages in detail. Ask for a free copy.

**THE FEDERAL LAND BANK
OF SPRINGFIELD
SPRINGFIELD, MASSACHUSETTS**

Symbol of democracy and culture is this meeting house at New Braintree in Worcester County, Massachusetts. The original burned in 1911 after serving 157 years as church and public forum. On May 22, 1776, New Braintree citizens gathered on this spot and unanimously voted "to support the General Congress if it shall declare independence." It did and they did.

The Northeast is a Good Place to Live

YOU'LL HAVE

More FULL MILK PAILS

WITHOUT EXTRA FEED COST when you use

Because PRODULAC is highly appetizing, it increases the palatability of the regular feed, thus insuring greater intake by your dairy cows... especially important while they are barn-fed. PRODULAC stimulates more complete digestion, too, resulting in higher milk yield. By promoting health, growth, production and reproduction, this highly palatable supplementary feed increases livestock profits. Ask your dealer for interesting booklet, or write direct to Dept. 15, Produlac Division, National Distillers Products Corporation, 120 Broadway, New York.

Fair MILK PRICES

Depend on

Dairymen Themselves

THE MILK situation, so far as prices to farmers are concerned throughout the Northeast, is better now than it has been in a long time. We must keep it that way, and farmers can to a very great extent control the situation.

Directors of the Metropolitan Milk Bargaining Agency met in Syracuse early in January, and in a constructive session made 1939 plans for closer cooperation among milk cooperatives and their leaders. In western New York the Niagara Frontier Milk Producers' Bargaining Agency is doing a similar good job. The great achievement of 1938, of the last ten years for that matter, was the determination of milk cooperative leaders, many of whom had been fighting one another, to work together. They did it, and it brought results.

But of course there are many problems ahead. We have with us the gang who work night and day to destroy these milk agreements both in New York and New England, to hamstring the Rogers-Allen law in New York, and to create prejudice, misunderstanding and hatred among dairymen everywhere. This gang is not a menace so long as farmers realize the situation and pay no attention to them.

Another problem, both in New York and New England, is what the courts will do with these marketing agreements. If they eventually declare them unconstitutional, at least they cannot take away the farmers' ability, proved through the past year, to work together. With that ability we can still find some solution to our milk marketing problem. **And dairymen must do this if their business is to survive.**

Another problem is too much milk. We are better able now, with the marketing agreements, to handle the surplus, but if these better prices result in more and more cows and more and more production, prices will soon have to go down. I hope every individual dairyman will carefully question his own heart when tempted to extend his business too rapidly. Better prices may not last forever, and they won't if there is too much milk. Right now there is a great surplus of butter. There are 193,000,000 pounds of butter in storage in the United States, approximately 75,000,000 pounds more than the five-year average. The government, through purchase of butter, has pegged the price at about 26 cents, but this has resulted in huge government holdings, and these are bound to

have a depressing effect on the price. One-third of the fluid milk price is based directly and two-thirds indirectly upon butter prices.

One way to help the butter problem is to eat more of it.

Right on this point comes the old problem of oleo. How dairy farmers can feed their families oleo and have the nerve to ask consumers to buy their milk, is beyond me! Yet you'd be surprised at the number who do. Ask any country grocer. Even those farm families which eat butter could use more butter and more milk. How quickly that 75,000,000 pounds of extra butter would disappear if every individual would eat just a little more. Milk organizations and cooperatives and milk agreements are all necessary in this modern marketing scheme, but nothing will ever take the place of individual work and responsibility. Every individual must still pull his share of the load.—**E. R. Eastman.**

Keep the Milk Order

After a great deal of dissension, the Rogers-Allen milk law was passed so that producers and milk distributors could bargain collectively and try and get the milk business on a sound basis.

As the milk which supplies New York City comes from seven states, it is not possible to make a law in any one state that will be satisfactory, as anyone can see that dealers can work one state against another to buy cheaper milk, so that means the prices for all seven states will fall to the lowest level, just the same as water runs down hill.

Well perhaps I hear some farmer say "That's easy, get a pump." Well, I won't call the Rogers-Allen law a pump but rather a dam that holds back fluid milk at a certain price, at this time \$2.45 for grade B, and the milk cannot go over the dam to the city below this price. Fluid milk cannot go for a dollar a hundred, or worse still, be auctioned off for what it will bring.

Now one big argument we hear against this plan is that it is a scheme to force all farmers into the League pool.

In the first place I wish to state there has always been a pool, long before the Dairymen's League was founded, and this pool is the New York market.

All milk products which you send
(Continued on Page 15)

MILTON R. LEE of Dexter, Jefferson County, N. Y., and his five-year-old herd sire **Moxonholm Superb Butter Boy**. Mr. Lee selected this bull as a calf because of the uniform productivity of his near relatives. He now has 8 daughters which have freshened or which will freshen in the near future. Mr. Lee keeps Cow Testing Association records so he will be able to compare records of these heifers with their dams. He is hopeful that they will be better.

THE 50 YEAR FIGHT FOR A LIVING PRICE FOR MILK!

Abuse!

Hatred!

THORNS THAT GO WITH LEADERSHIP

Lies!

Threats!

Reprisals!

Somebody had to start the fight for a living price for milk. Some group of men had to stand up and defy the Anti-Farm Gang. Some organization strong enough to face the threat of dealer reprisals had to take the risk. And the thousands of farmers in the Dairymen's League took this risk willingly—for the sake of their families and for the good of all farmers in the milk shed.

They knew that their action would expose them to the vilest kind of abuse, to the most unfair kind of criticism, to bitter hatred and lies. That has been the fate of men everywhere who have had the courage to defy the tyranny of entrenched interests. And in defying the Anti-Farm Gang, it was a foregone conclusion that there would be a fight. But no man ever imagined that fight would be so ruthless.

Only an organization with the numerical strength of the Dairymen's League . . . with the unshaken loyalty and faith of its members . . . could have survived the attack. For 20 years now it has been going on, the most vicious and unceasing campaign of villification, abuse and lies that any group of farmers anywhere ever faced.

BUT—and this is very important—thousands of farmers realize that these attacks have been directed not at the Dairymen's League alone, but at all farmers in the milk shed. The Anti-Farm Gang singled out the Dairymen's League simply because it was the spearhead of the movement against dealer domination . . . simply because League members were in the front-line trenches in the fight for a living price for milk . . . and because the League represented a form of co-operative organization that was particularly dangerous to Anti-Farm interests. For it was evident that if the co-operative ideas of the Dairymen's League became the common ideals of all dairy farmers in the milk shed, control of milk and control of the farmer's milk check would be lost forever.

So when you read below the true answers to the crafty propaganda that has been spread, remember that these bare-faced lies were really aimed at you and at the welfare of your family. They were intended to take money out of your pocket. They were intended to pull the wool over your eyes so that you wouldn't recognize your true friends, but would continue to remain apart, suspicious, fearful.

Now, let's see what some of those lies have been:

LIE NO. 1 . . . The Big Three

This was the sneakiest form of lying. It didn't dare come out in the open, so it just hinted. The hint was manufactured out of whole cloth by a propaganda organization hired for that purpose. A form of vicious gossip about "THE BIG THREE", linking the farmer-owned Dairymen's League with the dealer-owned Borden and Sheffield companies. It was an attempt to spread the idea that the League was a dealer organization. Of course it was a lie! And it was a particularly

We are farmers who comprise the oldest milk co-operative group in the New York Milk Shed. We know from our past experience that certain opposition and dealer reaction always appears after any forward step in milk marketing reform has been accomplished. That opposition is showing its head once more. Once again it is fighting the gains made by organized farmers as it has fought every gain made during the last 50 years.

That is why we farmers of the Dairymen's League are publishing today this series of statements. We want to reveal to farmers outside our own membership how this opposition has worked in years past. We want to show that this opposition always comes from the same source, and always uses the same methods. We hope by these statements to be of help to all co-operative farmers in holding and protecting what they have already won.

stupid lie because every thinking farmer knows that the Dairymen's League is a non-profit organization owned and run by farmers for farmers.

LIE NO. 2 . . . Borden-League Alliance

Another choice bit of propaganda—spread for more than 20 years—is an outright lie. It was proved to be a lie by the United States Government after a long and expensive investigation. Speaking through the Federal Trade Commission, the Government said in 1936:

"No evidence was adduced showing the exercise of any control by the Borden Company over the League * * * no evidence that special concessions were granted any particular distributors purchasing from the Dairymen's League Co-Operative Association, Inc."

And the State of New York nailed this same vicious lie . . . this same contemptible attempt to deceive farmers . . . when the Attorney General reported on the milk industry in 1938:

"To our knowledge no actual evidence of dealers' domination (of the Dairymen's League) has ever been found."

There's Government proof that the Anti-Farm Gang lies and lies and lies to deceive farmers. But here's another stupid charge:

LIE NO. 3 . . . The League Is Controlled by a Small Group of Men Who Perpetuate Their Own Jobs

One fact alone is enough to answer this: One-third of the League's directors are elected every

year, being voted on by the entire membership. In the 17 years since the Dairymen's League Co-Operative Association has been formed, there have been 72 different directors elected to the board of 24. This turnover is about normal for the board of directors of average stock corporations.

LIE NO. 4 . . . The League Is Charged with Poor Management—Heavy Overhead Cost

Let's look at the record. The Federal Trade Commission in its 1936 report says:

"* * * after operating expenses of the Association are paid by direct deductions from the proceeds of sales, capital expenditures are provided for by direct deductions which take the form of loans for which interest bearing certificates of indebtedness are issued to members.

"The League has paid the interest on these certificates when due and the principal at or before maturity, thus inspiring confidence in this method of financing co-operatives.

"Analysis * * * indicates that the officers of the Association during the seven year period April 1, 1930 to March 31, 1936 (the period covered in the investigation), exercised sound business judgment and maintained a satisfactory financial position."

Another part of the Federal Trade Commission's report tells how the finances of the League are audited and reported back to members. It says:

"The books, records, property and business of the Association are examined by the auditing committee at least once in each quarter of each fiscal year. Immediately after the close of the fiscal year a complete audit is made for the year by certified public accountants who submit a report to the members at the next annual meeting."

LIE NO. 5 . . . Attack on League Officers

One of the oldest tricks is the attempt to discredit League management by a demand for State and Federal investigations. During the last 10 years, these investigations have covered every activity of the League, including plant operation and management. But the only practical effect of these investigations has been to prove that the Anti-Farm Gang has been lying when it made charges. In the whole long history of the League, no official has ever been found guilty of any misconduct in office. And time and time again the investigations have clearly indicated that the demand for investigation was inspired by the Anti-Farm Gang.

Today farmers everywhere realize that attacks against the League and its officers are in reality directed at all dairy farmers. They have learned to look with suspicion on those who persistently criticize each and every move made in the interests of farmers. And they recognize that Dairymen's League members are every farmer's friend—patient and determined men who have willingly suffered abuse and misunderstanding in order that the fight for a living price for milk might be carried forward.

This Statement Is Published By the 30,000 Dairy Farmers Who Own, Operate and Control the Dairymen's League Co-operative Association, Inc.

New Supreme Court Justice

THIRD Supreme Court Justice to be nominated by President Roosevelt since he took office is Professor Felix Frankfurter, of Harvard Law School, who has been called one of "major architects" of New Deal. As we go to press, Senate is expected to confirm his appointment.

Born in Vienna in 1882, Professor Frankfurter came to United States at age of 12, unable to speak a word of English. He is now 56 years old, and in the 44 years that have gone by since he landed in New York City he has risen to one of highest posts in country—another proof that this is still the "land of opportunity."

Professor Frankfurter is recognized as an outstanding jurist and scholar, although believed by some to be too ardent a New Dealer to make an unbiased Supreme Court Justice.

President Reports to 76th Congress

CONGRESS and the nation received important communication from White House early this month—President Roosevelt's annual message to Congress, delivered in person in a House of Representatives packed with members of Senate, House, Cabinet, the press and distinguished visitors. Three main issues touched on by President were national defense, federal spending to "buy" prosperity, and another big supplementary appropriation—875 millions—to carry WPA to end of this fiscal year, June 30, 1939.

DEFENSE

Speaking not only to Congress and American people, but also to whole world over international hook-up, President Roosevelt denounced dictatorships, with their threats to liberty, religion and international good faith, and pledged defense of Western Hemisphere against invasion by their philosophies. Warning that "All about us grow more deadly armaments—military and economic," he called for military preparedness and a strong, united nation.

President followed up his denunciation of dictatorships by budget message next day, calling for record peacetime expenditure for national defense.

FURTHER SPENDING

Hope for more economical Federal government was dashed by President's demand for further heavy spending, not only for national defense, but also for "recovery" and relief, on theory that this will stimulate private business and eventually result in a national prosperity which will provide government with enough revenue from taxes to balance the budget—a theory which one commentator has compared to idea that a man can drink himself sober.

Sum called for in President's budget for next fiscal year is 9 billions. Total government income from all sources during same period is estimated at 5½ billions—which will leave government another 3½ billions in the red (tenth annual federal deficit in a row). This year, Federal expenditures top even that, being expected to reach nearly 9½ billions by July 1, with deficit of

around 4 billions. By 1940, national debt will climb to dizzy heights of \$44,458,000,000, more than double what it was in 1932.

Question of where all the money goes to is answered by chart published in recent issue of New York Times. Figures apply to coming fiscal year's budget:

Unemployment relief	22.4 per cent
National defense	14.9 " "
Interest on public debt.....	11.7 " "
Public works	11.6 " "
Social Security	10.3 " "
Legislative, judicial, civil.....	9.6 " "
A.A.A.	7.7 " "
Veterans' pensions	6.0 " "
Miscellaneous	5.8 " "

Same chart answers question, "Where does the money come from?" as follows:

Miscellaneous internal revenue	25.9 per cent
Income tax	21.2 " "
Social security taxes	7.6 " "
Customs	4.5 " "
Miscellaneous	3.0 " "

GOVERNMENT BORROWINGS

GOVERNMENT BORROWINGS	37.0 " "
-----------------------------	----------

SLANT: When President Roosevelt took office, he was keen for economy, talked of balancing the budget, and criticized deficit he inherited from Hoover Administration, saying that it added to ranks of jobless and intensified the depression. From 1933-37 he defended spending as an emergency to help those in distress. Now spending is pictured by him as government "investment" to bring about permanent prosperity, something which it certainly has not done during past six years, and can never do.

Take Politics Out of Relief

DISCLOSURES by Senator Shepard's special committee, which has been investigating Senatorial campaign expenditures since last Fall, reveal that committee found "unjustifiable political activity" in connection with work of WPA in several States.

Committee's report gives detailed statement of findings concerning several Senate campaigns. In Kentucky, Committee found that \$24,000 was collected from WPA workers and other government employees for campaign of Senate Majority Leader Barkley. The funds, said Committee, were solicited directly, and WPA workers were canvassed regarding their politics and number of voters in their families.

In one county in Pennsylvania, according to Committee's report, WPA workers who had registered Republican were transferred or discharged; also, WPA rolls were used by Democratic headquarters in mailing post cards soliciting campaign funds. Evidence was presented by Committee showing that relief workers in one Pennsylvania town 120 miles away from a certain Democratic rally were asked to buy tickets to the rally at \$1.00 each, and one WPA official who refused to take a ticket was discharged.

Committee also charges coercion and intimidation were used in Tennessee Senatorial race to get campaign funds from WPA and other government workers in that State.

In Cook County, Illinois, Committee found that 450 additional WPA workers were employed in the spring and dropped day after primary election.

About 70 of these men did no highway work at all, but were used to canvass the district before election.

Recommended by committee is extension and tightening of present law against soliciting campaign contributions from Federal employees; also, limitation of amount any individual can contribute to a campaign, a fuller accounting of campaign funds and creation of a permanent Senatorial campaign expenditures committee.

It is expected that in view of these disclosures Congress will do something definite in coming session about finding a new and better way of administering relief, and also will be more hard-boiled in voting additional relief funds. As we go to press, a House subcommittee, composed of 7 Democrats and 4 Republicans, has recommended cutting down by 150 millions President Roosevelt's request for emergency appropriation of 875 millions to carry WPA to June 30.

SLANT: Relief as it has been too often administered is a racket.

National Grange Speaks Its Mind

SPEAKING through Fred Brenckman, its Washington representative, National Grange told Congress that best thing it could do for the farmer would be to "pursue a policy calculated to restore employment in private industry."

Interdependence of agriculture and industry was pointed out in these words: "Just as the industrial worker is the best customer of the farmer, so the farmer is the best customer of the men engaged in industry. . . . They both go up or they both go down together."

The Grange urged Congress to overcome "any undue interference from the executive department," to stop writing blank checks for lump sum appropriations, reduce the public debt, revise distribution of relief, and let the public understand that heavy government spending for federal projects places "a first mortgage on every farm and every home in the land."

Secretary Wallace Offers New Surplus Foods Plan

IT IS reported that new plan for marketing surplus foodstuffs through co-operation of all divisions of food industry will be laid before annual convention of National-American Wholesale Growers Association, meeting in Chicago next week. Project is said to be substitute for "two-price plan" put forward by Secretary Wallace last Fall.

Secretary Wallace recently stated that the new plan contemplates offering plainly packaged wholesome foods in grocery stores at very moderate prices. These foodstuffs would be of good quality but below the fancy grades. Examples, it was said, might be meat ground into sausage and wrapped in plain cellophane, ungraded fruits sold by the basket at a unit price low enough to attract those of small incomes, and large cans of various products bearing no brand names.

From grower to consumer, according to reported plan, the movement of

goods would be handled on a smaller than normal mark-up. Recently Department of Agriculture initiated a plan to move grapefruit surplus, in which it got cooperation of everybody connected with the industry and is said to have resulted in putting grapefruit on market at bargain prices. Results in this commodity are being pointed to by Department of Agriculture.

Grocery manufacturers and distributors, however, are reported critical of new scheme, say it is "fine on paper" but unworkable. They declare that only a few products lend themselves to type of marketing proposed by Secretary Wallace. Breakfast foods, rice, bread and scores of other items, they say, cannot be separated into two different grades and marketed at different prices. They argue that it will prove impossible to confine the sale of specially priced foods to persons of low income, that all consumers will insist upon buying the cheaper goods.

Governor Lehman's Message

IN VERY conservative and statesman-like message to new session of New York State Legislature, Governor Lehman recommended that Legislature go slowly and carefully in use of money to carry out new provisions of state constitution for low-rent housing and for health insurance. On insurance, he recommended that commission be created to study problem.

SLANT: Republican legislators will probably fully agree with these recommendations. Certainly, citizens of New York, tired of ever-increasing taxes, will agree.

Anti-Americans Should be Suppressed

TO NEW session of Congress went 185-page report on anti-American activities by congressional committee headed by Representative Dies of Texas.

Committee has been collecting evidence and holding hearings during past year. Evidence brought to light is startling. Report said purpose of communists was revolutionary, that they bared from within labor, church and political organizations, that they provoked violence in labor disputes.

Equally bad, according to committee, is undermining anti-American activities of Nazi associations in this country, which committee said were directly linked with government control agencies in Germany.

More startling still was charge of committee that Secretary of Labor Perkins and Secretary of the Interior Ickes had attempted to cripple its activities.

Committee asked for further appropriation for continuation of its work.

SLANT: Dies committee should be continued, and bills should be passed, based upon report of this committee, to suppress un-American activities. If radicals don't like this America of ours, let them return from whence they came and to countries they claim are so much better than ours. There are plenty of Americans who would like to take some of these bad actors by shoulders and seat of the pants and give them a good start out into Atlantic Ocean.

Drought Affects Wheat Prices

DUST STORMS and drought conditions are again serious in some wheat states, where there has been little moisture since December. On this

Keep Union Labor's Hands Off Agriculture!

There is no more important job for farmers to do right now than the job of helping to turn back radical labor's march on farming. You can do your bit by signing the petition printed in the last issue (dated January 7) of *American Agriculturist* on page 5, and getting your neighbors and fellow townsmen to sign it. If you do not have a copy of this petition, write us for one.

If you feel that union labor's threat to agriculture is none of your affair, read the article on page 6 of this issue, entitled "It DID Happen Here!", telling the story of one man's experience with high-handed union labor officials; and re-read the article in our Jan. 7th issue, page 5.

No farmer can afford to be indifferent in this matter. Now is the time to register your opinion, before it is too late. Signed petitions are beginning to come into this office, but we want this to be a *hundred per cent protest from Northeast farmers*. If you have not already signed, get busy at once and get your local farm organizations to approve the petition and their individual members to sign it. Then mail signed petition to *American Agriculturist*, Box 367, Ithaca, N. Y. We will see that all such protests are submitted to Congress.

situation Kansas Board of Agriculture reports:

"Kansas wheat conditions made a further decline during past week. Growth is small and there is loss from soil drifting."

Similar reports come from Nebraska. Owing to this and other conditions, wheat prices are on upgrade.

Lower Insurance Rates for Safe Drivers

SAFE automobile drivers in New York State will have smaller bills for car insurance. On December 1st of last year there went into effect in that state a merit rating plan. Under plan, drivers are classified into A, B, and C groups. Class A drivers are those who have had no accident or one accident resulting in property damage only. They will pay the lowest premiums.

Class B drivers are those who have had one accident that resulted in bodily injury only, or one accident that resulted in both injury and property damage. They will pay 10 per cent more than Class A.

Class C drivers are those who have had two or more accidents that resulted in either injury or property damage. They will pay 15 per cent more than Class A.

Period on which classifications are based consists of 21 months, "beginning 2 years prior to date of the policy and ending three months prior thereto." Any applicant who makes an untrue statement about his record will have to pay double the rates he would otherwise be charged.

23 Million Tons Soil Nitrogen Lost Yearly

HARVESTED crops, erosion, grazing, and leaching cause an annual loss of 23 million tons of nitrogen yearly in United States, according to 1938 Yearbook of Agriculture, "Soils and Men." About two-thirds of this nitrogen comes back to the soil in form of

fertilizers, manures, rainfall, irrigation waters, and legume crops.

Yearbook gives other interesting facts about nitrogen, that important element upon which plant and animal life are absolutely dependent. An acre of soil in areas studied by Department of Agriculture scientists has from 2,000 to 16,000 pounds of nitrogen down to a depth of 40 inches; but it is estimated that the air above that acre contains from 145,000 to 150,000 tons of free nitrogen. Free nitrogen, however, must follow the "nitrogen cycle" before becoming available to plants and animals.

Savings Banks to Sell Life Insurance

NOW IN effect in New York State is law passed last April permitting savings banks to sell low-cost life insurance, including straight life, limited payment life, endowment and term insurance. New York law is based on one in effect in Massachusetts since 1929.

These bank policies are restricted in that no one savings bank may issue a life policy in excess of \$1,000, or annuity contract which pays more than \$200 in any single year. Also no person may obtain, from several banks, policies totaling more than \$3,000. Every savings bank policy will guarantee a cash surrender value six months from date of issue and loan values at rate of 4.8% after first year.

Here are some typical rates on a \$1,000 policy:

Age	Straight Life	Paid-up at age 65 years	Endowment at age 65
25	\$18.39	\$19.82	\$22.39
30	20.82	22.92	26.23
35	23.96	27.14	31.52
40	28.07	33.14	39.10
45	33.58	42.18	50.64

SLANT: Better talk, also, with representative of old line insurance company if interested in life insurance.

Dairy Products At Lower Prices

ACCORDING to United States Bureau of Agricultural Economics, butter prices are decidedly lower than a year ago, and lowest for this season since 1933. Relationship, however, between butterfat prices and feed prices continues about same as average for 1925-29 period, factor which helps dairymen. Also, there is some increased consumption of dairy products.

Famous Prisoner Set Free

TWENTY-THREE years ago this coming July, a bomb killed ten on-lookers and marchers at a "Preparedness Day" parade in San Francisco. Convicted of the bombing and sentenced to death was Tom Mooney. Later his sentence was changed to life imprisonment. Mooney insisted during his trial, and repeatedly during years since then, that he was "framed" because of his labor activities. Many people have believed this and given time and money to aid him in his long fight for freedom.

Just when the fight seemed hopeless (last year a United States Court put an end to legal efforts), politics came to prisoner's rescue. California's newly elected Governor Olson promised in his campaign last fall to consider case. Brief hearing was held before the Governor early this month, and Mooney walked out a free man.

Shortly after Mooney's release, he headed a great parade through San Francisco and was cheered by thousands. Labor leaders of all factions joined the march. Speaking to crowd

after the parade, Mooney declared that he intends to dedicate rest of his life to working for "a powerful, united labor movement."

Good Books to Read

HIDE AND GO SEEK, by Dorothy P. Lathrop. A good part of the attraction of this little book is in the animal drawings, drawn from real little models who have their nest at the author's home. The story is of the gentle, shy, secret little flying squirrels, whose day begins at dusk. It is planned for children of ages 6 to 8.—*The Macmillan Company, New York.* \$1.50.

DEATH SENDS A CABLE, by Margaret Taylor Yates. In a tropical setting of sun and flame trees, an atmosphere of sultry heat,

this tale of romance and intrigue is laid. The problem is the solving of what is supposedly a suicide and a death by accident, told from the standpoint of the wife of a navy man, who knows the world of secret codes, international spies and unswerving loyalty to "The Service."—*The Macmillan Company.* \$2.00

Good Movies to See

PYGMALION. Screen version of George Bernard Shaw's famous play. Leslie Howard is Professor Higgins, who transforms the little London cockney into a duchess and passes her off on the unsuspecting cream of society.

TOPPER TAKES A TRIP. Amusing screen fantasy of the further adventures of Mr. Topper and his well-meaning ghost. Hilarious comedy.

Build Soil Fertility with a McCORMICK-DEERING Spreader

• Keeping up soil fertility is a year-around job. But whether you apply manure in the spring or in the fall, you're making a splendid investment that will come back to you in richer soil and bigger yields.

With a McCormick-Deering Manure Spreader ready to go you can get manure onto the fields quickly, without taking too much time from seasonal work.

The McCormick-Deering is a light-running, easy-loading spreader. Twelve roller bearings and pressure lubrication give it light draft. The large-capacity box is built low to make loading easy. The box is rust-resisting; strong liquid manure will not cause it to corrode; the all-steel construction makes it strong and durable. A lime-spreading attachment, pneumatic tires, etc., are available on special order.

Ask the McCormick-Deering dealer to explain the many advantages of this spreader.

INTERNATIONAL HARVESTER COMPANY

HARRIS SEEDS

BEST FOR NORTHERN GARDENS

We breed and grow those vigorous early strains of vegetables and flowers that insure success for gardens whose seasons are short. Such seed is more hardy and vigorous and gives exceptional results wherever grown.

Be Sure To Try Harris' New Hardy Carnation!

Vivid colors, exquisite fragrance, profuse bloomer. Rivals greenhouse flowers in size. Blooms early in summer. Perennial easily grown from seed.

Send for Your Catalog Today!

... and to insure getting the best seed, order direct by mail from our Seed Farms. Prompt service.

If you grow for market, ask for the Market Gardeners and Florists Wholesale Price List also.

By L. B. SKEFFINGTON

From SKEFF'S NOTEBOOK

Fruit Growers Meet to "Swap" Ideas

A WARNING that fruit growers must adapt their business to the changing conditions of the day was sounded by President George A. Morse in his annual address to the New York State Horticultural Society at Rochester.

Morse raised the question of whether mechanical and other changes had taken place "faster than we are able to administer them satisfactorily."

He illustrated his point by saying that the motor truck has given us quick and efficient distribution. "Yet at the same time we now see truck movements demoralizing our markets because of our inability to foretell receipts at a given market." He urged that a reporting service be developed so that all shippers would have some means of estimating receipts.

Reviewing the work of the Joint Fruit Committee of a decade ago, President Morse advised the society to take steps to set up another such committee. He recalled that the previous committee had been created by the Horticultural Society and the State Farm Bureau Federation, and that its influence "had been very great in helping us shape the trend of our fruit business. We again have come to the point where we must take careful stock of what we have, where we are going, and what we must do."

"Perhaps we then can map a program that will be of benefit to our apple industry in this state, just as the previous committee did."

Frank Beneway of Ontario and Seth J. Bush of Morton agreed that peach growing could be a profitable business in certain desirable locations. Bush said the Elberta continued to be the most profitable peach, while Beneway termed the Golden Jubilee the greatest find he had seen.

Dr. V. R. Gardner of the Michigan Experiment Station and Carl Wooster of Union Hill outlined the program by which cherry growers and packers propose to raise a fund to advertise and increase the consumption of that fruit.

J. Roe Stevenson of Cayuga was elected president to succeed Mr. Morse. Wessel Ten Broeck, Jr., of Hudson, Percy A. Morgan of Lewiston and Bruce P. Jones of Hall were moved up as vice-presidents and Theodore Oxholm of Esopus was elected fourth vice-president. Rolland Reitz of Coldwater and Theodore Cross of La-Grangeville were elected members of the executive committee for three-year terms. Lawrence Howard was elected a member of the executive committee for one year. Holdover members are Jay Gelder of Chazy, Robert R. Brown of Waterport and Frank W. Beneway of Ontario.

A featured speaker on the program was Dr. Ira A. Manville, director of the nutritional laboratory of the University of Oregon Medical School. Manville has received wide notice in medical and nutritional circles in the past several years because of his research showing the healthful qualities of apples. He cited that a study of clinical records of more than 1,000 children suffering from intestinal disorders showed that all except 11 responded to treatment with raw apple pulp after

all other methods had failed.

Doctor Manville also said that recent studies show that apples have the effect of offsetting toxic influences in the alimentary canal. He said he first was interested in the old legends about healthful qualities of apples and wondered whether they had substance. As a result of clinical observations, he said, medical men are finding that apples really possess healthful properties attributed to them.

The outlook for 1939 was described as reasonably optimistic by Dr. William I. Myers, head of the agricultural economics department at Cornell University. Tracing the course of agriculture and country life over a period of years, Myers said that "by this time we ought to know there is no panacea, no one cure-all, for all our troubles. There was a time when some of us

thought cooperatives would solve all our troubles. Some cooperatives had been successful, so some of us thought more of them was all that was needed. The Federal Farm Board found that belief did not work out as expected. Then in our search for a cure-all we thought government could solve everything. Now we know better. We need a combination of individual effort, co-operation and sound use of government aid.

"We have found we cannot raise the price level by limiting production. The price level can be raised and maintained at a reasonably stable level by currency management. We seem agreed on the objective, but we still have to find the means to make it effective. Only action by the national government can do this."

One of the talks that received much favorable comment was by Dr. F. A. Harper of Cornell. He has been assigned to conduct research in fruit marketing in response to a request by the society a year ago that such studies be undertaken. Harper outlined the methods by which the research will be started and some of the problems which are to receive first attention. Comment of growers was that Harper had outlined a sound program, and Harper in turn said he had based it largely on recommendations received from a substantial cross-section of the industry.

Potato-Vegetable Men Meet

By PAUL WORK.

FOR THE twelfth time, the New York State Vegetable Growers Association and the Empire State Potato Club held their annual meeting together at the Hotel Seneca in Rochester. Many thought that this was the best meeting in the history of the organizations. Attendance is estimated at around 600 of which 100 were young folks who came to take part in exhibitions and judging contests with vegetables and potatoes.

Porter Taylor of the Agricultural Adjustment Administration outlined the policies of the Federal Surplus Commodity Corporation, indicating their insistence upon grower support and advice, upon prices low enough not to encourage increased production. He stressed the value of the service in placing a floor under the market. The association commended the program assuming the continuance of policies as outlined by Mr. Taylor.

Dr. C. E. F. Guterman of the College of Agriculture at Cornell highly commended the potato research program which has grown out of a prolonged and careful study of needs in the state.

Grower Experiences

Those in attendance hung with utmost interest upon the words of A. F. Hand of Greenwich, New York, on melons, Nat Talmage of Riverhead on potatoes and cauliflower, and E. B. Clark of North Norwich on peas and beans.

While Hand is 40 miles north of Albany, he has been very successful with muskmelons, achieving high prices for fancy goods and total returns far above those of most melon men. The results he attributes primarily to infinite care in many directions. He is very painstaking about sorting the melons before they go to market. The 7-cent-a-pound ones must be good and it is something of an art to learn to recognize them from the outside. This experience has to be backed by frequent cutting of samples.

Nat Talmage and his father, H. R. Talmage have now had two seasons experience with irrigation for 200 acres of their land. Using lightweight socket-connected pipes with whirling heads, they can water very rapidly and find that, in spite of an expensive well and pumping system, an increase of \$15 per acre in gross return will cover the cost of irrigation. Any further increase is profit. There are few sea-

sons when this result is not likely to be realized.

Earl B. Clark of Norwich reported good results with peas and beans on land not previously planted to these crops, that runs in the low soil classifications. Beans seem to be giving more satisfaction in the Central New York dairy country than peas partly because they are picked over a somewhat longer period. Yields on peas have declined of recent years. Mr. Clark emphasized the necessity of pre-cooling and keeping the goods cold until they get to market and also the necessity of eliminating marketing rackets.

Marketing Looms Large

Ferris C. Waite, Manager of the Capitol District Market at Menands, outlined the progress that has been made in this strictly farmer-owned-and-operated enterprise, in spite of strong opposition from political forces. He favors a short market period to avoid waste of time on the part of all concerned. Most of the business is done in 1½ to 2 hours. He has proposed effort toward coordination of the policies of all the large markets of the state to formulate plans for more effective facing of competition from a distance. He pointed out important improvements in packaging, particularly with cauliflower and muskmelons.

In the absence of D. B. Denman of the National Association of Food Chains, Mr. George B. Travis discussed relations between chain stores and farmers. Such sessions as this are doing much to build up better understanding between these two interests which have so much in common. It is perfectly evident that the organizations are exercising strong leadership to avoid harmful practices such as the use of loss-leaders and misleading advertising.

Potato Discussions

A round table was held on muck land potato problems. Chippewa and Warba are going strong among the varieties. John Coulter of Canastota reported fairly satisfactory results with dusting in large scale operation last season. He changed from a previous spray policy. Brushing of potatoes was strongly supported. Scab and wire worm injury cannot be disposed of after the potatoes are dug but something can be done about dirt and it apparently pays well. There was warm support of packaging of potatoes for chain store trade, particularly in the

better grades, although questions are freely raised. H. J. Evans outlined the very satisfactory experience of the Seed Potato Cooperative which is now engaged in marketing table stock in peck bags.

Business Action

Both associations commended the state trade-mark program, opposed discriminating measures which would tend to restrict trade outlets, and urged greatly increased support for research in the vegetable and potato fields. The vegetable men are laying plans for a committee similar to the one so successfully employed by the potato growers to survey the whole field of vegetable research for the state and work out a long time program.

The potato people asked enforcement of the state law on deceptive facing and misbranding, urged potato growers to vote on the potato marketing agreement proposal which will be advanced during the current year and urged growers to work toward cooperative grading, packing and selling.

The vegetable men asked for a committee to confer with federal and state authorities on improved crop and market report service with special reference to coverage in Northeastern territory and to non-carlot production and movement.

Action on AAA

The vegetable men gave long and careful consideration to agricultural adjustment measures, commending the federal surplus commodities purchase program as an emergency measure and with the proviso that current policies be maintained. A committee to explore application of the marketing agreement program to the vegetable industry of this state was asked and policies of the Farm Credit Administration were commended. The action on the allotment program which is new this year is as follows: "The allotment program presents grave danger in development of artificial control of vegetable production and is of very doubtful feasibility. The danger is minimized through the provision that participation is wholly voluntary. In line with resolutions of former years, we confirm our opposition to government crop control in any other than purely voluntary form." Thorough study of possible monetary reform was also asked.

The Show

The principal awards in the contests were as follows: For County exhibits of 10 plates of 5 tubers each—Wyoming took first, Schoharie took second, and Rensselaer third. Individual awards for plates went to Leon Malenbacher of Warsaw, first; Earl Schiemann of Warsaw, second; and Robert McCormick of Java Center, third. In 4-H vegetables, by counties, Schoharie came first, Madison second and Onondaga third.

In adult classes, Fred Hollenbeck, whose farm lies between the foot of the hill and one of the Tully Lakes in Onondaga County, won the sweepstake cup both for seed stock and 32 tuber samples of table stock in the Rurals. Gardner Brothers also of Tully took the cup for Cobblers and Newall Talbot of Edmeston for Green Mountains.

N.Y.S.V.G.A. officers were re-elected with Ferris C. Waite, Menands, as an additional vice-president.

Personals

Leland Lamb, who has made many friends among New York State livestock men as an Assistant Extension Professor of Animal Husbandry at Cornell, has resigned to become the first field representative of the American Dairy Cattle Club. The American Dairy Cattle Club is a new organization interested in promoting the milk pail type of cow. The Club aims to recognize milk production in cows regardless of color, breed, or previous history. O. L. Lepard, graduate of Michigan State College and a graduate student at Cornell, will take over Professor Lamb's former duties.

Dr. Harry Ross, chief economist of the Borden Co., and Miss Elizabeth Cook were married in New York City on January 12. Dr. Ross was at one time professor of marketing at the New York State College of Agriculture and is the author of a number of bulletins on milk marketing.

An Official Viewpoint on Marketing

By LELAND SPENCER.

THE previous article in this series stressed the need for giving consumers a wide choice of qualities, packages, and services at prices reflecting the differences in cost. Just a few days after that article was written, I examined a copy of the annual report of our Secretary of Agriculture, Mr.

Leland Spencer

Henry Wallace. The Secretary's statement on this same subject is excellent, and well worth quoting in this column.

"On the average," says the Secretary, "the American farmer gets from 45 to 50 cents of the consumer's food dollar. The rest goes to transportation agencies, processors, and dealers. The statistical evidence indicates a tendency for the farmer to get a smaller proportion of the consumer's dollar than he got before the war." (This is largely the result of higher wages in marketing and distribution.)

The report goes on to say that the number of man-hours required in marketing seems to have decreased "for a few years immediately after the World War. It shows practically no change for the period 1922 to 1938.

"This does not prove that there has been no improvement in marketing since 1922. Cooperative associations have brought economies into the system; improvements have been made in manufacturing and processing; cheaper methods of transportation have been found; new methods of retail distribution have grown up; and Government services such as market news and inspection have been developed. But why do these changes not show up as decreases in our statistics of marketing costs and changes?"

According to the Secretary's statement, it is possible that our statistics may be too inexact to show the changes in efficiency that we know have taken place. However, ".....the main reason for the absence of any indicated decrease in man-hours in marketing" very likely is due to the fact that "consumers constantly require more services of our marketing system. Vegetables once came mainly from market gardens near the consuming city; now they come in large quantities from distant points. Bacon used to be bought in the strip; consumers buy it now in a half-pound package, sliced, and wrapped in cellophane. Milk goes through a process of inspection, pasteurization, and bottling. Services like these are expensive. The added cost" (of additional services) "may offset most of the savings which have been introduced into the marketing system. Luxury habits and the demand for additional services grow up in times of prosperity, and persist during depressions. They increase the charges between the farmer and consumer.

"No one can reasonably object to giving the consumer fancy packages and more services if he wants to pay for them. But if processors, wholesalers, and retailers add expensive things when consumers do not need or want them, the cost will largely fall on the farmer. Consumers should have a chance to buy good food without expensive services—at a price that reflects the savings.

"We need to keep our pushcart markets and curb markets. We need more low-priced retail stores, which will

handle bulk foods and avoid expensive packaging. We need more accurate labeling and grading so the consumer can buy more intelligently. We need to avoid too much insistence on only first-quality foods. All foods should meet basic health requirements; but thousands of families would rather have grade C food at a low price than grade A food at a high price, and thousands of farmers have grade C food to sell. Our marketing system must efficiently meet the needs of the poor as well as of the rich."

"In the long run the most efficient marketing system will probably result from competition. Regulated monopolies may be the eventual answer in a few industries." (Very likely the milk industry is one of those for which the Secretary contemplates such developments.) "The marketing system needs modernization. Substantial improvements have been developed in the past, but there is room for more."

These views will strike A. A. readers as thoroughly sound and constructive. Programs for improvements in marketing that are based upon these principles should receive enthusiastic support from farmers in the A. A. territory.

Milk Trial

From the dairyman's point of view Samuel Miller, head of the Queensboro Farm Products Co., gave one of the most interesting pieces of testimony during the trial, which, in effect, may test the constitutionality of the New York Milk Marketing Agreement.

Mr. Miller stated that the New York City milk market has become badly demoralized since the start of this suit involving the Jetter Dairy Co., and the Schuyler Junction, Central New York and Rock Royal Cooperatives. The purpose of the action started by the government is to force these cooperatives to abide by the terms of the order.

Another bit of interesting testimony was given by Walter Kohn representing the Cooperdale Dairy Co. Mr. Kohn indicated that the company was opposed to the marketing program when it went into effect, but, impressed by the able administration by Administrator Harmon, they now favored it. Federal Judge Cooper granted the four defendants' request for information on the number of cooperatives participating in the voting, how they voted, and the total number of votes cast by cooperatives. Judge Cooper ruled that while this information might be confidential outside of court, it could not be regarded as confidential in court. The general opinion seems to be that the case has been moving very slowly.

In the Buffalo area there has been organized a protective association of independent dairymen. Those favoring the continuance of the Buffalo order indicated belief that this group is attempting to rally the interests who supported the Truett Dairy in its fight to avoid contributing to the equalization fund. That dealer is one of three in the Buffalo area against whom Commissioner Noyes has sought injunctions because of their failure to contribute to the equalization fund.

It is estimated that producers in the Buffalo area received three-quarters of a million dollars more during the last two months than they did during the two months previous to the establishment of the order.

Poultry

Estimated storage holdings of eggs for the first of the year were slightly better than 300,000 cases, compared with 88,000 cases a year ago. However, eggs have not been coming out of storage quite as rapidly as some of the optimists had hoped.

Production has been increasing which reflects the increase in pullet population, and what is needed to balance the situation is increased consumption.

The egg and feed ratio continues

favorable and is expected to do so, at least until the middle of the year. The week ending January 5 it took 6 dozen eggs to buy 100 lbs. of feed. A year ago it took 7. For the same week, top New York wholesale price for white eggs was 24c, 2c less than it was a year ago.

A Look Ahead

(Continued from Page 8)

of gradually increasing yields. Total United States production has increased slightly but production per capita has declined gradually since 1900. Production averaged 3.6 bushels per capita for the ten years 1900 to 1909, 2.9 bushels from 1933 to 1937, and 2.8 bushels in 1938."

"Potato prices in the fall of 1938 were approximately the same as those in 1937, and less than one-half of the 1936 prices. This is partly the result of both limited consumer purchasing power and large supplies of most vegetables. Any increases in consumer purchasing power will tend to increase potato prices in 1939. The size of the early crop may also be an important factor during the late winter."

"The large carryover of 2,200,000 bags of beans plus the 1938 crop, gave a supply of 17,100,000 bags. Domestic disappearance from 1933 to 1937 averaged 12,800,000 bags annually. Shipments last year from the United States were 470,000 bags; imports were 106,000 bags."

"Because of low prices, planted acreages of beans in 1939 probably will be reduced below 1938. Greatest reductions are expected in those areas that produce red kidney, pea, and Great Northern beans."

Keep the Milk-Order

(Continued from Page 10)

into that market or pool raise or lower prices according to the demand there is for them. If the demand is good you get higher prices, but if there is no demand and part of it has to go into storage to be held in the market pool, you will get lower prices, and don't let the politicians or spellbinders tell you any different. Therefore, how can the League force you in a pool when you have always been in one even if you didn't know it.

You know that, as an individual, you cannot dictate what you will receive for your milk, that without organization you can only take what the dealer wishes to pay you.

The Rogers-Allen law attempts to bring system and order into the milk business, and obtain the highest prices possible for milk and its products based on the New York market or pool. Therefore, if you wish to keep your market, demand of your assemblyman that the Rogers-Allen law shall not be changed.

Here's hoping for a more prosperous

NEARBY MARKETS for NEARBY POULTRYMEN

Progeny Testing

By L. E. WEAVER

THREE years ago a few New York poultry breeders who were trap-nesting some of their birds started keeping their records on a basis that allows them to obtain a progeny test of the breeders. I have been keeping in touch more or less with these breeders, also with some who had previously

L. E. Weaver

started the work on their own initiative, and with others who have since started the work.

Pullets hatched in the spring of 1937 completed their first laying year just recently. Now the owners can tell from the records just how good or how poor, as breeders, each male and female used in 1937 really proved to be. I have seen some

interesting results and many disappointments. Hens that laid 300 eggs and more may produce very poor offspring, or none at all. The daughters of a given male may have an exceptionally high average egg production, but along with that may go very high mortality. Of course, he should not be used again, nor any of his sons. On the other hand, these disappointments are offset, in part at least, by the occasional discovery of some phenomenal bird.

For example, Mr. Bodine of Chemung, N. Y., has a male, now three years old, whose 41 daughters, hatched in 1937, averaged 247 eggs each for all that lived a full year. Only 12 per cent died, an exceptionally good record. It marks this bird as a valuable tested sire.

* * *

Fifty-Cent Chicks

Here is an experience related by one of my colleagues. He had spoken at a poultry meeting, and after the meeting, a man (we will call him Mr. X) wanted some advice. It seems that Mr. X is a beginner in poultry and had it firmly in mind that he must get top-notch stock to start with. So he announced that he planned to order 600 chicks at fifty cents each.

After my colleague had caught his breath, he asked Mr. X why he was paying so much. "Well," said Mr. X, "this man puts out a wonderful catalog, he has three grades of chicks, and these are his best grade."

It was difficult to convince Mr. X that there are better measures than

price by which to judge the value of chicks, and that it is not necessary to pay quite that much to obtain foundation chicks. Mr. X did decide to limit his purchase to 200 chicks.

* * *

About Pullorum Testing

The more I hear and the more I read about blood testing of flocks to make them free of pullorum disease, the less concerned I become about the *method used*; and the more I am concerned about *who did the work*. I am convinced that in the hands of a trained and experienced operator using a reputable, standardized stained antigen, the short method can equal the long for all practical purposes. I know, too, that the long method is far from fool-proof. Furthermore, I am told that with some flocks no testing is needed to establish their freedom from pullorum disease. They are "clean by reputation."

If I were purchasing chicks to become the foundation for a breeding flock, I would prefer them from a flock "clean by reputation." That would indicate two things to me. First, it would indicate a sanitary and well-managed poultry plant. If an owner is careful about disease prevention, he can be counted on to be careful as well about his breeding and incubation. Second, a flock that is clean without any resort to blood testing probably possesses high natural resistance to pullorum disease.

Now here is the way I feel about this whole matter. I don't want to take any chances on pullorum disease, and I don't have to. If I lose half of the chicks before they are two weeks old, it is my own fault. I have been warned. So I must be sure the chicks are pullorum *clean*, not just blood-tested or pullorum tested. If I can make a check-up on a flock that is "clean by reputation," and convince myself that they actually are clean, that is all there is to it. I will get those chicks. But that check-up must be on more than just talking to two or three people who have bought this man's chicks.

Since such investigations are not easy to make and take a lot of time, I would probably have to buy chicks from a pullorum-clean flock. That point having been decided, I would next ask, who did the testing? Then I might have to do some checking up on the training and experience of the tester. Last of all I would ask which method was used. If the answer is the "long" method, also called the "tube" method, I will feel just a little more secure than if it is the "short" method, or the "antigen" method, but I wouldn't hesitate about buying the chicks if I was convinced that the tester knew his job.

Part of the poultry plant of Samuel Tucker of Wakefield, Rhode Island. Mr. Tucker says it takes no more time to care for 100 birds in a house than it does when they are all under one roof. Each pen has running water and the feed is mixed and carried to the house by truck and the eggs are picked up by the truck. Mr. Tucker trap nests 780 birds and raises cockerels from hens that lay at least 250 eggs during their pullet year.

Baby Chicks

CLIP THE COUPON

ALMOST every day, questions have to be faced of how to buy things needed for farm and home most profitably and economically. Getting full value for every cent you spend becomes an easier matter when you read the advertisements in AMERICAN AGRICULTURIST. The advertisements tell you what changes are being made to better the products, where you can get them and how much you should pay. Only advertisements of dependable manufacturers are accepted by AMERICAN AGRICULTURIST. They contain helpful information on almost any phase of farming and homemaking. Make use of them—it will cost you little or nothing to make inquiries and the knowledge you gain will prove a great savings in time and money. And when you write advertisers, clip the coupon and say you saw the ad in

Firestone Buys Four-H Champion

Mercer, 1938 grand champion steer at the International Livestock Exposition. Owner of the steer is Irene Brown. Back of her at left is her brother, Raus, and at the right is her father, Dave Brown.

The steer was sold to the Firestone Farm Service Bureau for \$3.35 a pound. Under sponsorship of the Firestone Farm Service Bureau, Mercer will start early in January on a three-month exhibition tour. He will travel in a specially built trailer, constructed in replica of a modern dairy barn, and will stop in approximately 60 cities in major cattle breeding states. He will be exhibited under the auspices of the local Firestone dealers.

This is the time of year when slippery roads and pavements constitute a hazard for drivers and pedestrians. The International Salt Co. of Scranton, Pa., has printed a well illustrated little booklet entitled "Making Icy Pavements Safe With Rock Salt." This booklet points out that at zero temperature a pound of salt will melt 3.7 lbs. of ice. Recommendations are that not less than 100 lbs. of salt be added to each cubic yard of cinders or sand.

The DeLaval Separator Co. of 165 Broadway, New York City, is sponsoring a DeLaval contest with 100 cash prizes totaling \$3,000. You can get details from your local DeLaval dealer. Every contestant will receive a free copy of the pocket-sized DeLaval Dairy and Farmers Handbook.

The Federal Land Bank, Springfield, Mass., will be glad to send any reader

Reprinted from a recent issue of the "Case Eagle", a trade publication of the J. I. CASE CO. of Racine, Wisconsin, this picture gives visual evidence of the size to which grasshoppers grew out in the West last summer. The camera never lies — so they say.

copy of "Safe Financing", a folder which gives detailed information about farm mortgages.

The Hall Brothers Hatcheries, Box 59, Wallingford, Connecticut, will send one or all of five leaflets on chick troubles to any reader who requests them. You can order by number.

1. Helpful Hints on the Starting and Care of Chicks.
2. Coccidiosis and Enteritis.
3. Prolapse and Cannibalism.
4. Laryngotracheitis; Bronchitis; Coryza; Pox.
5. Successful Battery Brooding.

The Horse and Mule Association of America have prepared a pamphlet on the control of sleeping sickness in horses. This was done as a service to horse owners, and partially to pay for the cost of preparing it, the Association asks that you inclose 3c for postage when you make your request for it. Just drop a post card to The Horse and Mule Association of America, 407 S. Dearborn St., Chicago, Ill.

Barclay's Betty, a little brown 19-year-old Ayrshire cow weighing but 990 pounds, and owned by Hugh J. Chisholm, Strathglass Farm, Port Chester, New York, has established a new cumulative milk record for the Ayrshire breed by producing 177,207 pounds of milk and 6001 pounds of butterfat. Barclay's Betty has produced more milk per hundred pounds liveweight than any other known animal.

Barclay's Betty is the mother of fifteen calves, and is unconcernedly anticipating the arrival of another in the spring. The value of her offspring may be gathered from the fact that eleven of them have been sold for \$7440. Her registered descendants to the third generation are now owned by 106 breeders in 15 states and number 916 head, with more being added every week. Three of her daughters still reside with their mother as highly regarded members of the Strathglass herd.

NEARBY MARKETS for NEARBY POULTRYMEN

Our Poultry Congress

By J. C. HUTTAR

AS I SAID once before, the Seventh World's Poultry Congress will be held in the United States. The place is Cleveland. Put that in your book. And the dates are July 28 to August 7, 1939. Put them in your book, too,

J. C. Huttar

because you will want to go, and I'll tell you why. The poultrymen of the United States have a privilege and a job which the poultrymen of other countries missed when the Congress was held on their home soil.

No Subsidy

Previous Congresses were held in Holland, Spain, Canada, England, Italy, and Germany. But in each of these the national government footed the bill. In this country the Congress is to be staged by the poultrymen themselves. The federal government did put up one hundred thousand dollars (chicken-feed when you read the figures of the proposed national budget for 1939), but most of that will be used to put up the federal government's exhibit.

The Congress must, therefore, be financed out of three main sources:

1. The exhibitors' fees, both competitive and commercial.
2. The admission fees while the Congress is in session.
3. The purchase of one dollar memberships by poultrymen all over the United States.

One dollar makes you a member of this great world event and entitles you to admission every day of the Congress. If you have anything at stake in the poultry business, you owe it to yourself to go to this Congress. It may not come back to this country in your lifetime. If you just can't get to go, I still think it's a dollar well invested.

A Crying Need

I have pointed out many times in this column that the biggest ill in the egg market is lack of consumption. We produce one of the finest food articles offered to the public, but lack of strong publicity has forced eggs to take a back seat in the human diet. Citrus fruits and breakfast cereals have crowded eggs off the menu of many a morning meal. I have no quarrel with these two foods. They are both fine. But they don't compare with eggs in nutrition per pound or per dollar. However, they have national magazine advertisements, radio programs, and huge billboard ads behind them, and the public certainly believes what it reads and hears.

The plans for the Congress give more attention to bringing eggs and poultry meat before the public than any other feature of the whole industry. I have heard these plans explained by the chairman of the Consumers Publicity Committee. I have heard her tell of the event which will have the prominent women of many nations exhibit the egg dish of their respective countries. Mrs. Roosevelt is expected to prepare and display the one for the United States. I've heard her tell of the angel-food cake baking contests for prospective brides, brides of one year, and old timers at the marriage

game. Also about the turkey carving contests for prospective bridegrooms, bridegrooms of a year, and old timers. But these are tame compared to some of the other exhibits which the Committee have planned.

DID YOU KNOW THAT EGG CONSUMPTION INCREASED 30 PER CENT IN CANADA THE YEAR AFTER THE CONGRESS WAS HELD THERE? Why, even a ten per cent increase in this country would have averted the recent slump in egg prices.

This feature of the Congress alone makes it important to every poultry raiser in the United States to get back of the Congress in three ways.

1. Get a one dollar membership.
2. Talk up the Congress and get it publicity in your local press.
3. Go to the Congress.

If you need some help in securing interesting stuff about the Congress for your local papers to feature, write to Wallace Moreland, Extension Department, N. J. State College of Agriculture, New Brunswick, N. J. He's on the Publicity Committee of the Congress.

In each county of the Northeast there is a Congress Committee at work getting one dollar memberships. If you don't know who your Committee is, write to Hugh Cosline, Associate Editor of this paper. He's on the New York State Congress Committee. He'll tell you who your county chairman is.

New Hampshire, New Jersey, and possibly some other northeastern states, are already "over the top" in their quota of Congress memberships. New York and Pennsylvania are gathering steam. If you live in these or any other northeastern state, get your membership now.

Oversubscription

I think it will pay us to oversubscribe this Congress, and I'll tell you why. I attended the last Industry Committee meeting of the Congress. I'm a member of that committee. There's quite a lot of us who feel that any profit that may accrue after the Congress is over shall be used to publicize eggs further.

You see, we poultry people have lacked a strong organization. We have also lacked funds to do anything big enough to attract much attention from the public. About the only kind of publicity we've had has been the wrong kind. Like when some so-called comedian makes a wise-crack over the radio about old eggs or bad eggs.

There are now over five thousand people actively engaged in Congress work. That's a pretty good start toward an organization. If we oversubscribe this Congress, we may have a nest egg for some really favorable publicity. With millions of people keeping hens, the cost per poultryman of a bang-up national egg eating campaign will be very small indeed. That's why everybody must get behind this golden opportunity.

If we oversubscribe this Congress, and I think we will, maybe a year from now our kids, instead of sending in cereal box tops to get cowboy suits, will be sending in egg carton tops to get baseball suits.

It is our Congress, our privilege, and our job. The farmers of this country can pay their own way without government subsidy, can't they?

Whew! That's the first campaign speech I ever made and I'm all tuckered out.

I hope it goes over.

In sunny California, age-old mountains look down from snow-capped heights to orange groves in the valleys below.

Don't Miss This Thrilling Trip!

JUST about four weeks from now, a happy party of *American Agriculturist* folks are going to climb aboard the "North Shore Limited" and roll westward to a land of sunshine and warmth, of spectacular beauty and awesome grandeur. Every mile of the way will bring new interests and new thrills, climaxed by a visit to the world's most stupendous and most colorful canyon—the Grand Canyon of Arizona.

Those who have seen the Grand Canyon say that it is impossible to describe its changing beauty. One visitor wrote of it, "By day the immeasurable abyss of the Grand Canyon is filled with molten color; by moonlight it is a blue mystery." This great chasm, which John Burroughs called "The Divine Abyss", is a mile deep, 217 miles long, from 7 to 11 miles wide, and at the bottom of it is the mighty Colorado River, rushing seawards. Rising from the depths of the canyon are whole ranges of mountains, their tops only slightly below the rim of the gorge. Over the rock temples and far down into the cavernous depths of the canyon spreads a sea of shifting rainbow colors that defy description.

Comfortable busses will take our party on motor trips along the rim of the canyon, with stops at Hermits Rest and the Watchtower to view the illusive beauty of the Painted Desert. That day we will dine at El Tovar Hotel, internationally famous for its wonderful cuisine. Opposite the hotel stands a faithful reproduction of the terraced dwellings of the Hopi Indians. Here native craftsmen—silver-smiths, basket-makers and blanket-weavers—will be seen at work, and Hopi Indians will perform their colorful ceremonial dances for us.

But each and every day of the trip will hold its own thrills. For more than a thousand miles on the trip across America to the West Coast, we will see majestic mountain scenery from the windows of the Northern Pacific crack train, the "North Coast Limited." Arrived at the West Coast, one of the striking sights seen early in the trip will be the Grand Coulee dam, now in process of construction, which will ultimately span the Columbia River 4000 feet from cliff to cliff. When finished, the dam will be the largest power development possible in North America.

As you stand there before the vast work now in progress, there will come a vision not only of the day when the dam will be completed and the Columbia harnessed for the purpose of irrigating a million acres of land, but also a vision of those long-ago days when the deep canyon of the Grand Coulee was the bed of a far mightier Columbia River than we know today. Geologists tell us that hundreds of thousands of years ago, an ice sheet 4000 feet thick descended from the North and blocked the natural course of the great river, forcing it to cut a new

path which came to be called the Grand Coulee—50 miles long, several miles wide, with walls of rock towering in places 1000 feet. As the ice retreated, the river went back to its original bed, and it is just where the river once broke through that the Grand Coulee Dam is being built.

We will have ten whole days in sunny California itself. Just the very names of the places we will visit there are names to conjure with—names that spell romance and beauty and history: The forest of the giant Redwoods, Mission Dolores, Santa Barbara, Hollywood, Treasure Island in San Francisco Bay where you will see the magic city of the West Coast World's Fair; Chinatown and the Spanish quarters in old Los Angeles, the famous Huntington Library, the

Rose Bowl, and California orange groves.

Best of all, those who come with us on this marvelous all-expense trip will have no bothersome traveling details to bother with—for this is a specially conducted tour and we pride ourselves on making these tours one hundred per cent perfect in traveling comfort, congenial companionship, and scenic interest. If you have gone on an *American Agriculturist* trip, you know how wholly delightful these trips are.

Write us today for a copy of the complete itinerary, addressing E. R. Eastman, editor of *American Agriculturist*, Box 367, Ithaca, N. Y. This entails no obligation on your part. The entire expense is approximately \$325, depending on where you live. Decide now to take the trip that perhaps you and your wife have been thinking of taking for a long time. You will never regret it.

If you have already received a copy of our itinerary, please note that there is an error in it under the heading "Routing Instructions", for it says that tickets should be purchased from your local ticket agent. This is incorrect. Send in your \$5 deposit with your reservation to Mr. Eastman (address given above), and tickets will be sent to you by the Northern Pacific Railway after you have made full payment.

We also want to call attention again to the item in the printed itinerary under "Clothing", which says: "Be sure to take along a comfortable pair of shoes. You will be doing a lot of walking." The suggestion about the shoes is all right, but with the exception of your visit to the World's Fair on Treasure Island, it will not be necessary to do any walking unless you wish to. All sightseeing trips are made in comfortable stream-lined busses.

For Your 1939 GARDEN

(Continued from Page 1)

dragon, Cynoglossum or Chinese Forget-Me-Not Firmament, Petunia Velvet Ball, Verbena Blue Sentinel, Early Sunshine marigold and Ladybird Petunia.

Chinese Forget-Me-Not, variety Firmament, is a hardy annual, with rich blue profuse blossoms on 2 ft. high plants. Although Flaming Velvet petunia which won the All-America gold medal in 1936 reverted or broke and therefore could not be depended upon to come true to color, the new variety called Velvet Ball almost approaches the red color which made Flaming Velvet famous.

Verbena Blue Sentinel grows bushy and upright instead of sprawling over the ground. Each umbel of flowers is held up over the plant like a little parasol, with each little floret inclined to curl upward, saucer-like. The demand for dark blue flowers and one which may serve for bedding or for cutting would make this a very useful flower.

Early Sunshine Marigold blooms much earlier than its parent Dixie Sunshine which received an award in 1936.

Ladybird Petunia, also dwarf, is a deep rose color which almost approaches red. Darker veins towards the throat give it a rich appearance which makes it desirable for bedding and pot culture.

Many varieties were given honorable mention—Golden Glow Marigold, Royal Velvet Cockscomb, Petunia Apple Blossom, Scabiosa Blue Moon, and Fantasy Zinnia White Light.

Golden Glow Marigold is a new odorless form with tubular petals of golden yellow. There is a collar of guard petals around the outside. Royal Velvet Cockscomb or Celosia, has a large central mass of rich crimson or carmine bloom; its leaves have a bronzy green color with red margins. This plant is particularly useful for drying.

Petunia Apple Blossom is light pink,

dwarf, all-double fringed, of the Victorious strain, and is therefore particularly popular for pot and window-box use. Scabiosa Blue Moon is more of a beehive shape than of the familiar pincushion appearance. Its plants are low and flowers are a deep lavender blue. This is one of the best annuals for cutting. The new Fantasy Zinnia White Light has the curled, crested and interlaced petals which characterize all Fantasies. White Light goes very well with Star Dust, which you remember is canary yellow.

All-America introductions of previous years which seem to have entrenched themselves with the public are: Yellow Supreme Marigold, Guinea Gold Marigold, the Gleam nasturtiums, wilt-resistant asters, Calendula Crysanthus, Larkspurs Rosamond, Blue Bell and White King, Los Angeles aster, rustproof snapdragons, Fantasy zinnias, then the named variety Star Dust, Martha Washington petunia, Phlox Gigantea art shades, Cosmos Sensation, Petunia Dainty Lady, Cornflower Jubilee Gem, Iceland Poppy Yellow Wonder, Salmon Supreme Petunia, Pansy Coronation Gold, Calliopis Golden Crown, Petunia Topaz, Calendula Orange Fantasy, and double Shasta daisies.

Some new zinnias which I found very satisfactory during the past year were Zinnia Linearis, a creeping form, and Mexican zinnias which had variously colored centers edged with a yellow line. I particularly enjoyed petunia Martha Washington which is quite dwarf, but has fairly large blossoms of a lavender hue with rich purple veining.

An old variety of an annual which gave as much pleasure as any in the garden was Alyssum Maritimum,—just sweet alyssum, but oh, how sweet when the old sunshine struck the border full force!

LETTERS

Beaverkill, N. Y.
December 7, 1938.

N. A. Accident Ins. Co.

Ithaca, N. Y.

Dear Sirs:

Enclosed please find check for renewal of my policy, also for renewal of policy of Lucy Ackerly.

I also want to thank you for your prompt remittance of disability check for \$130.00 covering full 13 weeks I was laid up. Please send me some blanks and I will try and get some new policies for you.

Very truly yours,

A. J. ACKERLY.

* * *

Randolph, New York,

December 29, 1938.

N. A. Accident Ins. Co.

Ithaca, New York.

Gentlemen:

I am acknowledging receipt of your draft for \$84.28 in payment of my accident claim.

Please accept my thanks for your prompt action in handling this claim and let me assure you of my appreciation of this check and I would like you to know that I think this is the best insurance that one can have for the amount of money invested and that I shall continue to be a policyholder in your Company.

You may have my permission to publish this letter.

Thanking you again, I am,

Sincerely yours,

ARTHUR CASE.

* * *

North Norwich, N. Y.

Jan. 7, 1939.

N. A. Accident Ins. Co.

Ithaca, N. Y.

Dear Sirs:

I am writing to thank you for your check which came yesterday covering the full amount claimed for injuries received in car accident of September 9th. It came promptly and without trouble of any kind.

I have sold the Grange Life Insurance for a period of over 10 years and am more or less familiar with insurance contracts. I can truthfully say that no company could live up to the letter of their contract to a fuller extent than the North American Accident Ins. Co. have in their settlement with both my husband and myself.

I know of no company that gives as much protection for so little cost and I shall be very ready to recommend this accident insurance to those I meet.

You may use this letter in any way you wish.

Yours very truly,

NETTIE H. JENKS.

Lesson IX. MEAT

IN MEDIEVAL days as many as twelve kinds of meat, fish and game were known to appear on one banquet table. This was no mean achievement, considering that the man or men of the household had to catch or kill the animals which provided these dishes.

Nowadays the homemaker's chief problem is how to select good meat when she buys it from the shopkeeper. Meat which is graded and stamped by federal inspectors tells its own story in the stamp; that which bears no stamp, she will have to be able to recognize or she will need a butcher upon whose word she can rely absolutely. Of course if it is a home butchered animal, she knows the creature's age and what to expect in the way of tender cuts from it.

Government classes of beef in order of excellence are steer and heifer, cow beef, stag beef and bull beef; the official grades in order of their excellence are prime, choice, good, medium, common, cutter and low cutter. The grades from bull, cow and stag are the same except that the top grade of prime is absent. The best grades come from steers and heifers.

If meat is stamped "choice steer beef", it means that the rounds or thighs, loins and ribs are well developed and plump. The cheaper cuts of choice steer beef, such as shoulders and plates, are thick and heavily fleshed or have a high percentage of flesh and a low percentage of bone. The flesh is light red in color, firm and velvety to touch. A view of the cut surface shows small streaks of fat running through it, thus making the cooked meat tender, juicy and flavorful. This is called "marbling".

The greater bulk of best dairy cow carcasses goes into "medium cow beef." Usually this means that hip bones and shoulder joints were prominent, therefore a round of this beef tapers off quickly, with a small amount of lean meat. The cheaper cuts of this grade are thin in meat and heavy in bone; texture of flesh is apt to be coarse and the color dark, while the meat feels soft and moist. Fat is yellow and may be absent from plates, shanks and neck.

Baby beef comes from 10 to 15 months old calves which weigh from 750 lbs. to 1,000 lbs. Beef from these creatures is lighter in color than that from an older animal. It also lacks a strong beef flavor, but is pleasantly tender and juicy. The fat of baby beef is white and flaky whereas that of more mature animals is creamy in color. Bones in baby beef are soft and porous in the center, never hard and solid. The older the animal, the harder and whiter the bone.

Veal, the flesh from calves, should be pale pink or soft rose with very little fat at the edges. Flecks of slightly pink fat may be seen in the meat. Veal should not be soft to the touch. The bones are reddish and soft.

Pork should have a fine grain and be firm to the touch. The flesh of the young animal is nearly white while that of the older animal has a pinkish cast. The fat should be evenly distributed and be firm and white.

Lamb is a light pink color, the flesh darker as the animal grows older. The fat is white and very firm. The bones of the young lamb are slightly streaked with red and the joint is serrated.

The beef creature is cut up into tender cuts and less tender cuts. In the first group are: 1. steaks: sirloin, porter-

house, tenderloin, club and rib (short cut); 2. roasts: rib and loin. The less tender cuts, and therefore less expensive, are steaks: chuck, shoulder, flank, round and rump; 2. roasts: chuck ribs, cross arm, clod, round, rump; 3. stews: neck, shoulder, skirt, shank, brisket, plate, flank and heel of round.

For tender cuts, the following methods of roasting give best results,—and these methods have been tested out in order to prevent undue shrinkage and yet yield a palatable product. One way is to brown the meat in a hot oven (500° F.) about 20 to 30 minutes, and then reduce the oven

—Photo courtesy of Armour & Co.

A standing rib roast is the choicest of all beef roasts.

ATTENTION, CONTESTANTS!

WE ORIGINALLY announced that the *American Agriculturist* Cooking School would be confined to ten lessons. In order to cover all of the material we had hoped to, we find it necessary to extend the course to twelve lessons. Lessons X, XI, and XII will cover salads, breads, and puddings.

We have had several requests for a lesson on cookies. If you would like one on cookies, please send us a postcard saying so *at once*, and address A.A. Cooking School, Box 367, Ithaca, N. Y. *Unless a majority of those enrolled in the school want this extra lesson on cookies, it will not be given.*

We repeat again that any one who did not enroll when the school started may do so now, or at any time up to the end of the course, provided they send in their answers to questions published with each lesson. Reprints of back lessons will be sent on request.

In connection with this lesson on meat, we suggest that you write to the following companies for their free booklets, and state that you are taking part in *American Agriculturist* Cooking School:

Food Economics Dept., Armour & Company, Chicago, Illinois: "The Meat You Buy."

Home Economics Division, Swift & Company, Chicago, Illinois: (Various booklets on uses of fancy meats, veal cookery, and fresh pork sausage.)

National Live Stock and Meat Board, 407 South Dearborn St., Chicago, Illinois: "Facts About Meat."

For the benefit of new subscribers, we add that this is not only a cooking school but also a contest with cash prizes. For full details, see our September 24 issue, or write us.

to a moderate temperature (350° F.). The other way is to cook it at a constant moderate temperature without browning first.

If one has a gas or electric oven with a thermometer and heat control, the first method is easy because the temperature can be quickly lowered to the moderate temperature. With other fuel it is a little more difficult to lower temperature quickly although it can be done simply by opening the oven door for a few minutes. If the oven is difficult to control, the better method is to maintain a constant moderate temperature, about 350° F. Whether the meat is rare, medium or well done will depend upon the length of time it stays in the oven. By the first method, allow about 16 minutes per pound to cook the meat rare, 22 minutes per lb. for medium and about 30 minutes per pound to cook it well done. A meat thermometer inserted so that the tip of the thermometer is in the center of the roast, is the most accurate way to tell when a roast is done. It should register 140° for rare, 160° for medium and 180° for well done.

Pork roasts should cook 25 to 30 minutes per lb., in a moderate oven. The thermometer should read from 180° to 185° F., since for all pork products, thorough cooking is absolutely necessary to remove any danger of trichinosis.

Any boned roast requires more time than one with the bones left in. To test for doneness you can prick a thick fleshy part of the roast with a skewer and if there is no suggestion of pinkness in the juice and the meat is tender, no further cooking is necessary. Slow cooking makes for tenderness and juiciness in meat because the product is not shrunk so much as when a high temperature is applied. No water and no cover should be used for any roast, as both tend to draw out juices. If the roast is placed fat side up, it will be self basting; it may be turned over to-

QUESTIONS

(Send your answers to the following questions to American Agriculturist Cooking School, Box 367, Ithaca, N. Y., not later than February 4.)

- 1—If you were planning a company dinner and wanted the best beef roast, what cut would you order? From what kind of beef?
- 2—Tell exactly how you would cook it, stating size of roast.
- 3—If you were serving an "economy" meal, what meats might you select. (Name at least 2). Name the process of cooking which you would apply to each.
- 4—What are the most important things to remember in cooking all tender roasts and steaks?
- 5—Name two favorite ways of extending the meat flavor. Cite familiar recipes illustrating these methods.
- 6—How does fresh pork differ in appearance from fresh baby beef?
- 7—What differences, if any, would you observe in cooking the two?
- 8—Tell how to broil lamb chops, giving temperature and length of time.
- 9—Make a menu suitable to serve with broiled steak; with lamb stew.
- 10—Name cuts of beef needing to be cooked in the presence of moisture unless ground up.

to soften the connective tissues. Stews or pot roasts, which utilize the liquid for gravy, are favorite uses for such cuts. Grinding the tougher cuts for meat loaf or patties is another device for using less choice parts.

Meat Loaf

2 lbs. ground meat	1½ cups milk
4 tablespoons butter or drippings	1 cup bread crumbs
4 tablespoons flour	½ teaspoon salt
	¼ teaspoon pepper

Make a thick white sauce of the flour, fat and milk and use it to bind together the meat and bread crumbs. Mold into a smooth mound on a piece of tough white paper. Lift paper and all on to a rack in an open pan. Do not add water and do not cover the pan. Cook in a moderate oven 350°-375° F. one to 1¼ hours.

Two or more kinds of meat make a pleasing blend of flavors. Beef and pork, or veal and pork are good combinations. To get flavorful drippings for the sauce, fry diced salt pork until light brown and crisp and cook in the fat bits of celery, onion, parsley or other seasonings to develop their flavor.

Meat patties should also be "bound" with a combination of flour and egg. To 1½ lbs. hamburger, use 2 tablespoons flour, 1 egg, ¾ cup milk, ½ teaspoon salt, ¼ teaspoon pepper. Just sprinkle flour over meat and mix thoroughly, then stir in egg and milk. Drop by spoonfuls onto a hot frying pan, using plenty of fat to prevent sticking.

Swiss Steak

3 lbs. lean beef about 2½ in. thick	1½ teaspoons salt
3 tablespoons melted suet	¼ teaspoon pepper
½ cup flour	2½ cups hot tomato juice and pulp or hot water

Sift the flour, salt, and pepper together and beat thoroughly into the steak with a meat pounder. The beating makes the meat more tender, and the flour absorbs the juice. Cut the steak into individual portions, if desired.

Sear the meat in the hot fat in a heavy skillet or kettle. Cover with the tomato juice and pulp or the water, adding more if necessary. Place a lid on the cooking utensil and simmer for two hours or until the meat is so tender it can be cut with a fork. Turn the pieces occasionally during the cooking. If the gravy becomes too thick, add more liquid from time to time. There should be plenty of rich gravy to serve over the meat. Onions may be browned and cooked with the meat if desired. Serve piping hot.

Brown stew is made in the same general way as Swiss steak or pot roast. For stew, cut the meat into inch cubes and roll in flour. Brown well in hot fat, add water or tomatoes, cover, and simmer until tender. Onions, carrots, turnips, and potatoes may be added if desired.

Stuffed Flank Steak

Flank steak	¼ teaspoon pepper
1½ cups stale bread crumbs	1 onion, minced
1 teaspoon salt	½ cup chopped celery
	2 tablespoons butter

Wipe the meat with a damp cloth. For the stuffing, brown the celery and the onion lightly in the butter and combine with the other ingredients. Spread the stuffing over the steak. Beginning at one side of the steak, roll it up like a jelly roll and tie securely in several places with clean string. (When carved in slices the meat will be cut across the grain.) Sear in a small quantity of fat in a baking pan on top of the stove, turning the meat frequently until browned on all sides. Cover closely, place the meat in a moderate oven, and cook for one and a half hours, or until tender. When the meat is done, remove from the pan and prepare gravy as follows: Drain off the fat. For each cup of gravy desired, measure 2 tablespoons of fat and return to the pan, add 1½ to 2 tablespoons of flour and stir until well blended and slightly browned. Then add 1 cup of cold water or milk and stir until smooth. Season with salt and pepper. Serve the stuffed steak with browned potatoes.

"Oh! For a minute I thought you were my husband coming home! I was going to bat his brains out!"

Best Remedy for Coughs Is Easily Mixed at Home

Needs No Cooking. Big Saving.

To get the quickest imaginable relief from coughs due to colds, mix your own remedy at home. Once tried, you'll never be without it, and it's so simple and easy.

First, make a syrup by stirring 2 cups granulated sugar and one cup of water a few moments, until dissolved. A child could do it. No cooking needed.

Then get 2½ ounces of Pinex from any druggist. This is a compound containing Norway Pine and palatable guaiaicol, in concentrated form, well-known for its prompt action on throat and bronchial membranes.

Put the Pinex into a pint bottle, and add your syrup. Thus you make a full pint of really splendid medicine and you get about four times as much for your money. It never spoils, and children love its pleasant taste.

And for quick, blessed relief, it is amazing. You can feel it take hold in a way that means business. It loosens the phlegm, soothes the irritated membranes, and eases the soreness. Thus it makes breathing easy, and lets you get restful sleep. Just try it, and if not pleased, your money will be refunded.

When Old Nance Wore Socks

The Amateur Poet's Corner

WE KNEW that it would be a backward spring that year, for we had not yet seen a wild goose flying northward or heard a crow—and already it was the 26th of March. There was indeed, nearly four feet of snow on the ground, and at night the temperature dropped to zero. As we should not be able to make maple sugar until April,—it is useless to tap the trees until warm days come,—Theodora and Ellen set off to pay a duty visit to a relative who lived eighteen miles from the old squire's in a remote corner of the woods.

"Remote," in fact, by no means describes it. I think that it was the most lonesome place I was ever in. To reach it you had to drive a long way between the shore of a dreary lake, known as Mud Pond, and a steep, spruce-clad mountain. The road was so narrow that there was scarcely room for a team to squeeze through the alder bushes that lined it. And the farm was as dreary as the road that led to it: an old, weathered house and barn standing in a straggling, stumpy clearing amid gloomy woods.

One of Grandmother Ruth's nieces, Adaline Dresser, had married a bashful, awkward fellow named Lyman Burpee; and neither she nor anyone else could ever coax him to move away from his lonely farm. In moments of impatience Grandmother Ruth had been heard to exclaim that it would take a stump machine to lift Lyman Burpee out of that clearing.

The soil of his farm was unproductive, frosts came early, and the poor man could never raise half enough to live on comfortably. But there he stayed all his life, and at last,—years later,—by his own wish, was buried beside a huge rock beyond the old barn.

Grandmother Ruth, who was very loyal to her kindred, always felt it her duty to visit Adaline once a year. But after Theodora and Ellen were fourteen or fifteen years' old, grandma was not wholly unwilling to have them go in her place and carry the usual family donation.

That year when spring come so late, the annual duty visit had been sadly postponed. We had kept putting it off for one reason or another throughout the winter. Then, at supper one night, Ellen suddenly exclaimed that none of us had been up to Cousin Adaline's yet!

"No, we haven't!" Grandmother Ruth replied in a conscience-stricken tone. "Some of us really must go. Adaline will think it strange if we don't come."

"The sooner the better, then," the old squire remarked. "This is the 26th of March. Snow will soon go off and mud time come. Better go tomorrow."

So it came about that Theodora and Ellen, who were to make the duty visit that spring, set off the following forenoon with steady old Nance and the pung, for the old squire wished to send Lyman two bushels of apples, a bushel of potatoes and some seed corn of a new early variety. And to that, grandmother added a dozen skeins of yarn, a bed blanket, a knit "hug-me-tight" for Adaline herself, and her second-best winter cloak that she had planned to give her niece at the beginning of winter.

On account of Nance's shoes, the old squire had some misgivings about letting the girls take her. The mare had been having an easy winter at the barn, for she was a little past hard work. She had not been shod since the fall before, and her shoe calks were therefore worn down rather smooth. That did not matter in snow, however, and as there were no signs of a thaw the old gentleman let the girls

take her. Nance was the only really safe horse for girls to drive that we had.

We were all glad, however, when Kate Edwards offered to go with them. Kate was rather more resourceful in emergencies than Theodora or Ellen.

They started about nine o'clock, sitting three on the seat. The morning was so sharp that they wore hoods and mittens, and I remember how red their cheeks were as they drove off and looked back to say good-by. The whole rear of the pung was piled high with the load of presents; to make the load a little smarter as well as safer, Addison and I had spread a small canvas

By C. A. STEPHENS

cover over the top of it and lashed all fast with several turns of a small but strong rope.

"We shall look for you back tomorrow night or by noon next day," the old squire said to them.

That afternoon the weather moderated rapidly. Toward evening the sky clouded, and the next morning it was raining hard—the beginning of a downpour that last three days. Winter broke up suddenly and all that four feet of snow turned to slush and water.

"Well, they will not start out from Adaline's in such a storm as this," the old squire remarked. "No doubt they are there and under cover. We need not worry, I guess."

"My grief, but won't the time seem long to them!" Addison exclaimed. And we all laughed, thinking what that little, dark, dreary house must be like in a rainstorm, with Cousin Lyman scarcely speaking a word to anyone.

But they were having a better time than we knew. The long drive up there had been pleasant, and on their arrival at the farm Cousin Lyman had come out and greeted them fairly cordially. Kate afterwards declared that he had actually smiled!

Then there were the presents to un-

pack and distribute, and after that they had a cosy dinner, with a fine roast of venison. Lyman had shot a deer only the day before; he bound up one of the hind quarters in a burlap sack for them to take home with them.

Cousin Adaline had one little spare room where there was a fireplace. That room the girls shared together, and Lyman of his own accord kindled a fire for them every night. So, all in all, they had a very comfortable, pleasant time of it.

None the less they were glad to start for home when the weather finally cleared, as it did during the fourth night, with a snapping wind from the northwest. Baffled winter, indeed, rushed back for a final blast. It was zero weather again the next morning; the slush had frozen hard, and the road was a bed of ice.

When Lyman saw how smooth shod old Nance was, he tried to persuade the girls to stay. But they were bent on coming home; not until they had started did they realize how hard it was for Nance to keep her feet. Before they had gone two miles she fell down and cracked one shaft of the pung; but they coaxed her to her feet again and, carefully picking their way past the iciest places, went on at a slow pace.

But when they came to the place where the road skirts "Hedgehog Ridge," old Nance stopped. The road there was for a considerable distance a sheet of sloping ice where the water had run down across it from the upper side and frozen. On the lower side of the road the ground, now glare ice, sloped downward for thirty or forty feet to the brink of a crag ten or eleven feet high; from the foot of the crag an even steeper slope ran down to the bank of Otter Brook.

In that weather it was a very dangerous place, and with a smooth-shod horse more experienced persons would no doubt have turned back. But the girls were anxious to get home; it was very cold, and the wind blew fiercely. After some hesitation Kate got out and, taking old Nance by the bit, tried to lead her on. The old beast started

Because of the number of contributions, we do not return poems not published. Keep a copy of your poem.

The limit in length is sixteen (16) lines and poem must be original and written by an amateur. \$2.00 will be paid to the author of each one printed. Check will be mailed on or about first day of month following publication.

I Knew Such Joy

I knew such high, ecstatic joy last night
That suddenly the world seemed far away,

And God and I were left alone to watch
The slowly closing portals of the day.

My heart was lifted up until it seemed
That I must run away and hide my eyes
From beauty's sheer resplendent radiance

That made gold Heaven of the arching
skies.

The splendor of that glory-blazing sky,
The Artist's shining Presence by my side,

Made a reflection glow within this heart
Long after all the sunset-colors died.

—Edna Hurd,
R. 4, Biddeford, Maine.

reluctantly forward.

Nance had not taken many steps when her smooth shoes flew from under her. Down she went on her side, cracking the other shaft, and then slid, pung and all, down that icy incline to the very brink of the little crag. There, by a supreme effort, she saved herself from going over.

Theodora and Ellen had jumped out of the pung when it began to slue and had managed to creep back into the road, where presently Kate, who had pluckily held on to old Nance's head as long as she dared, joined them. The slope was so slippery that they had had all they could do to save themselves. And there, down at the very brink of the crag, lay old Nance and the pung!

What to do they did not know. Kate's first thought was to run and summon help, but it was a long way back to the Burpee place. Every moment they expected to see old Nance go over the rocks, and then down into the roaring brook below! If she had struggled to get up she would surely have gone over the brink. The old creature seemed to realize that she must not move, for she lay there absolutely still, with the wind blowing her mane.

While they were racking their brains as to what to do, Ellen thought of the rope in the pung—the one with which Addison and I had lashed the canvas over the bundles. Lyman had put both the canvas and the rope under the seat.

"Couldn't we pull her up with that rope?" Ellen asked.

Kate feared that the line was not strong enough, but thought that the plan was worth trying. At not a little risk to herself, Ellen crawled down the icy slope to the pung, got the rope and came back. They tied one end to the stump of a little spruce tree that stuck up through the ice beside the road. Then Kate, steadying herself by the rope, went down and tied the other end to the saddle girth about old Nance's body.

All three girls pulled together at the upper end of the line, but soon found that they could not stir old Nance. As a matter of fact, six men could not have hauled the horse up that slope. The animal rolled her eyes up at the girls but made no effort to get up. No doubt she knew better than to try.

Realizing that they were wasting

The Song of the Lazy Farmer

water warmed to suit her taste; a cow the dog has never chased would be insulted, I should think, if icy water she must drink. Them cows give lots of milk for us and help make farmin' prosperous, but we must earn the milk we git, we have to work all day for it a-gittin' hay down from the mow and bein' nursemaid to a cow!

WHEN I was young the cows was tough, and tho their hair was long and rough, they rustled in the wind and snow, a-huntin' food where it might grow. They rustled for their straw and stalks, and exercised with nice long walks a-lookin' for their daily meal; we didn't worry 'bout their weal, they'd drink from out an ice-filled tank, when spring came they were lean and lank, the milk they gave wa'n't very much for balanced rations, bran and such wa'n't on their menu in that day, and timothy was first-class hay.

But times have changed, a critter now must have her hay from out the mow, alfalfa hay it must be too, for common feed would never do for fancy bovines of the ilk that in these days produce our milk. We musn't let them cows expose themselves whene'er the north wind blows, in cozy barns we shut 'em up, and each one has her drinkin' cup with

BROOKS

By Norma Roberts.

Spring brooks are noisy,
Full of glee,
Rushing 'neath the alders
To the sea.

Summer brooks are lazy,
Winding slow
Through sunny fields where
Daisies blow.

Autumn brooks are calm
And still,
Listening to the crickets
Shrill.

Winter brooks are hushed
In sleep,
While shining stars their
Vigil keep.

their strength by trying to haul her up, the girls pulled the rope as tight as they could and made it fast. That at least would keep the poor beast from sliding over the cliff.

Still old Nance lay there without stirring.

"It's her smooth shoes," Kate said. "She doesn't dare try—"

At that moment Theodora uttered a little exclamation. She had remembered that once, years before, when it was very icy outdoors, grandmother made her pull some old socks on over her shoes to keep from slipping down. Why could they not put some socks on old Nance?

"We can cut up the canvas cover!" she cried, when she had explained her plan.

As it happened, Ellen had a little knife in her pocket. The girls spread the canvas on the ice and soon had it cut into four pieces, each about two feet square. All three now crawled cautiously down to the pung again, untied a piece of tarred string from Lyman's quarter of venison and then proceeded, not without much trouble, to tie those squares of canvas over old Nance's hoofs. They wrapped the pieces of canvas about the mare's feet, gathered the edges up about her forelegs and secured them in place with pieces of the tarred string. What they would have done next I do not know, and I do not believe that they themselves knew; but fortunately at that moment help came.

THAT morning, after it had cleared off so cold, the old squire, thinking of Nance's smooth shoes, had grown very anxious.

"Do you suppose the girls will start for home this morning?" he said.

"You may be sure they will!" grandmother exclaimed. "They will be too homesick to stay a moment longer than they have to. I shouldn't wonder if they were on their way this minute."

"Boys," the old squire said, turning to Addison and me, "you had better hitch up Whitefoot in the light horse sled and drive to meet them. Whitefoot is sharp shod and won't mind the

ice; but I'm afraid those girls will have trouble."

We put on thick coats and were soon on our way. Our young horse was eager for the drive and spanked along at a great pace for two hours or more until we came to Hedgehog Ridge.

"Gracious, but isn't this an icy place?" Addison muttered. "Wonder if the girls really started? They could never get old Nance over this!"

"Well, there they are!" I cried, for just then we caught sight of them. "What's the matter there?" I called to them.

Almost frozen and pretty nearly in tears, the girls crept up to the road and explained what had happened. The situation, indeed, explained itself; and now it was for us to see what we could do.

If the rope that they had tied to old Nance had been stronger, we should have let Whitefoot drag the prostrate mare up to the road; but we did not dare risk it with that light line. Remembering that we had passed a logging camp where men were at work, two or three miles down the road, Addison asked me to drive back there as fast as I could and ask them to lend us a warping line, which we knew they were likely to have.

I drove to the camp, succeeded in borrowing a long two-inch rope and hurried back. We turned the sled, made the large line fast to it, and then, creeping down to old Nance, passed the other end of the line round her body. To give her a better chance to help herself we freed her from the pung by unhooking the tugs and hold-backs. We tied the little line to the pung in order to keep that from going over the brink.

"All ready now!" Addison called to me. "Take Whitefoot by the head and start him gently."

THEN a queer thing happened. Before I could start Whitefoot, old Nance made a sudden violent scramble, got on her feet, came up the icy incline in those canvas socks, and reached the road without aid from anyone!

I never saw a horse make a finer effort, and all of us cheered her. She seemed to have been planning that spurt all the time she had been lying there. She had her pride and was not going to be dragged up there on her side, like a sack of meal! The canvas socks held wonderfully.

After hauling the pung up to the road we set it on the sled and made the girls as comfortable as possible in it with the robes and blanket. But at best that was a cold ride home. Addison sat in front and drove; I stood behind on the pung and led old Nance. We had feared that it would be difficult to get her home, but in point of fact she slipped very little. Although the idea of putting socks on a horse struck us as droll, it certainly helped to get us and old Nance out of a very bad situation on that cold day.

"But you advertised 300 hats at \$1.00 and I've only tried on 29!"

YOUTH Marks Its Favorites

THE EFFECT of youthfulness is achieved by charming necklines, snug waistlines and various perky touches such as turnover collars, manish cuffs, frivolous pockets, besides fascinating belts and sashes.

The suspender dress which is sweeping the country like a brush fire has many fashion features to its credit besides being very, very practical.

SUSPENDER OUTFIT PATTERN No. 2076 includes jacket, blouse and skirt. Any part of the outfit may be worn with something else which doubles its usefulness. Plaid wool for jacket and skirt with plain blouse, or plain skirt and embroidery on the suspenders to repeat the blouse color, are delightful possibilities. Pattern sizes are 12, 14, 16, 18 and 20 years, 30, 32, 34, 36 and 38 inch bust. Size 16 requires 3½ yards of 39-inch material for the jumper and bolero and 2 yards of 39-inch material for the blouse. Embroidery No. 11175 costs 15c extra.

DRESS PATTERN No. 2737 is the popular shirtmaker type but with tricky pockets which lend an appeal all its own. It is equally attractive in velvet, rayon crepe silk or rayon challis print. Pattern sizes are 12, 14, 16, 18 and 20 years, 30, 32, 34, 36, 38 and 40 inch bust. Size 16 requires 3½ yards of 39-inch material with ¼ yard of 39-inch contrasting.

TO ORDER: Write name, address and pattern size and number clearly and enclose 15c in stamps. Address Pattern Department, American Agriculturist, 10 North Cherry St., Poughkeepsie, New York.

Today in Aunt Janet's Garden

Give House Plants a Chance

TAKING care of those Christmas gift houseplants is oftentimes a puzzle to the happy recipient, for few homes can give plants the special care that the florist gives them.

Dry air is an enemy to most plants and the average living room is terribly, terribly dry. One reason why geraniums seem to thrive better on the kitchen window sill is that the boiling teakettle adds moisture to the air. A pan of water on the radiator is better than nothing. In bitter weather, plants need to be protected at night from the cold window glass by layers of newspaper or by being set away from the window altogether.

The poinsettia, being a tropical plant, is sensitive to chilling and if the pot becomes cold throughout, it should be sunk into warm water up to its rim to revive the plant. Overwatering will cause the leaves to turn yellow and drop; on the other hand, being too near a radiator makes them drop also. A room temperature of 70° and plenty of light gets the best results.

By the end of January, the blooming period probably will cease. Then the plant should be dried off gradually, and placed on its side, in its pot on the basement floor. Early May will be the time to repot it. Then the pot may be sunk in the soil in the garden. If the plant has grown tall and leggy, it should be cut back to 6" and the pot watered throughout long dry spells.

The Jerusalem cherry may be enjoyed another season, not by drying off the plant in the manner of the poinsettia, but by keeping it actively growing. After frost danger is past, trim back the branches severely, remove from the pot and plant outdoors in a sunny spot. By the time frost threatens, the plant is ready to bring indoors again.

The cyclamen will not tolerate a wet soil or poor drainage. Setting the pot in a pan of water until the moisture is drawn to the surface is the best way to water it. The cyclamen wants plenty of light but no direct sun. 50° is the temperature which makes it most happy.

After its blooming season is over, the soil should be kept fairly moist until new growth begins to show. Then repot into a compost of equal parts of loam, sand and leafmold, together with a little dried manure.

The Land of Beginning Again

By Emma M. Foye.

I stopped at a sign-board marked End of the Year;

I had traveled through shadows and rain.

Just beyond was a wonderful, glorious land,

'Twas the Land of Beginning Again.

I paused ere I entered, and one backward glance

Showed my many mistakes all too plain:

And I thanked God devoutly for another chance

In the Land of Beginning Again.

A chance to be kinder, more thoughtful, sincere,

To think less of self, be less vain;

A chance to help others throughout the new year,

In the Land of Beginning Again.

So with Hope born anew, and a prayer in my heart

That my efforts would not be in vain, I entered that wonderful, glorious land, The Land of Beginning Again.

Northeast Markets for Northeast Producers

For Type and Milk Production

Buy Your Next Herd Sire From THE WAIT FARMS

Leading our association for milk and butterfat production 9 year average.

Bull calves of all ages for sale, including several old enough for service. Prices reasonable.

New York State Jersey Meeting

Jersey breeders and others interested in the program are invited to attend the annual meeting of the New York State Jersey Cattle Club to be held at 10 o'clock on Saturday, February 4th, in the Onondaga Hotel at Syracuse.

In the morning the business of the club will be handled and the proposal to hold a summer cattle sale will be discussed. After the noon luncheon Dr. G. J. Hucker will show natural colored moving pictures of scenery and agriculture of New Zealand where he spent six months last year on mastitis control for the new Zealand government. Then L. C. Thompson, fieldman for the American Jersey Cattle Club will discuss Jersey Club activities in New York. The meeting will be concluded with a discussion on dairy problems of New York State by Leland Lamb, Extension Professor at Cornell University.

Kernels, Screenings and Chaff

By H. E. BABCOCK.

It has been our experience at Sunnygables that it has paid us to raise our chicks on a farm where no old birds were kept. We also have seen to it that the man who raised our chicks avoided any contact with poultry on other farms. This is a view, taken last sum-

mer, of the brooder houses in which we grew our pullets until they were old enough to be put out in range houses. The picture gives you a good idea of the hill-sides around Ithaca, New York. Our Sunnygables farm lies on the floor of the valley.

IN OUR family, Mrs. Babcock keeps the books. The fact that she does this gives me a sense of comfort. I at least know that she will never find herself in the position I have seen so many women in, who knew nothing at all about the business affairs of their husbands. I can think of no more helpless or humiliating position for a woman to find herself in than to have to try to pick up the threads of a farm business when she hasn't the slightest idea of what it is all about.

Make a Will

There is another document which is always kept in order in our family and that is a will, in fact two wills, each carefully worked out with reference to the other *and with reference to both of them possibly becoming effective at the same time.*

I am led to mention this rather personal matter which so many people avoid mentioning or even recognizing because during the course of my life I have seen the possessions of several families tied up and even considerably dissipated when the head of the family died without leaving a will.

I hope you won't think I am impertinent but I know a lot of my good friends read this page and I'd like to make my New Year's message to you "Make a Will". Don't put it off, because if you do you'll just forget it. Making a will doesn't mean that you are going to die any sooner.

Now, having digressed from the discussion of our farm books which I intended to write about, I'll return to them. Right after the first of the year, Mrs. Babcock handed me a sheet of very interesting figures. They covered the itemized receipts and expenditures of our farm operation during the calendar year 1938.

Poultry and Hogs

As might be expected, the man who handles the poultry and hogs made the best showing despite the fact that during part of the year we ran with some empty laying house pens.

If I learn anything from my 1938 figures, it is that I must so plan my pullet raising that I keep my laying houses operating at capacity all of the time. This coming year, we are going to try to raise enough pullets to

do this and, in order to be sure that we shall, we are also going to try to raise some to sell as well. We are starting with 2,000 chicks this month. From the labor angle, we will have to increase our poultry and hog labor from one man to a man and a half. To help carry the extra labor, we shall also double the number of our brood sows.

Inventory Shifts

During 1938, we made one big shift in our livestock inventory. We reduced the book value of our horses from \$3200 to \$1015 by selling \$2685 worth of colts. By January 1, 1940, I hope to get this figure even lower and to spread it over not more than four work animals and three head of saddle stock. While we came out all right, I am sure that I shall feel much easier owning less than \$1,000 worth of horses than I did owning over \$3,000 worth.

The money we took out of horses was mainly invested in Guernsey calves and heifers. As a result of this move, we inventoried on January 1st over 50 dairy heifers, and the ownership of these heifers is forcing us to face another problem which I will speak about presently.

Livestock on Hand

On January 1st, we had the following livestock on hand:

4 work horses, 3 saddle horses
39 head of Angus cattle
25 head of Herefords
55 head of dairy heifers
177 ewes, 3 bucks, 50 lambs
7 brood sows, 1 boar, 34 pigs
1293 hens

As I have studied the above inventory, I am pretty well satisfied with it except that the sale of some 750 old birds in the early winter reduced our hens too much. The dairy heifers also can be safely increased to at least 75.

Both of these inventories can be built up I hope by early summer.

New Enterprises

Some 30 of our dairy heifers are bred to freshen next fall. Between now and then, we have got to make the difficult decision of whether or not to go back to milking cows. We've gotten along quite comfortably for three years without doing it, but I am aware of the fact that during this period we have had unusually good prices at times for beef, pork, and lambs, and of course the colts we purchased and made into finished teams helped out.

Another enterprise for which we will be all ready in the fall, and which I believe we can add without having to hire any more labor or spend cash for equipment, is feeding lambs. Our present plans call for getting all set to feed 750 to 1,000 lambs at Larchmont next fall.

Expenses to Cut

Studying the expense side of our picture, two or three items stand out which can be cut considerably. The most prominent of these is what we paid out for gas and oil. If the modern hired man and, particularly, the modern farm boy have any outstanding weakness today, it is unquestionably for gasoline. It is so much easier to hook a tractor to a manure spreader than it is to harness up a team. Little trips can be made so quickly that the gasoline which is used in making them seems unimportant. As a result there is so much useless running around with trucks, tractors, and passenger cars that on any farm where it is not rigorously controlled the bill for gasoline just mounts and mounts.

A 1939 resolution at Sunnygables is to cut the gasoline and oil expense.

Another item of expense which looks bad on our record is for machinery. I think that this item will look bad on

almost any farm where careful cost accounts are kept and annual depreciations charged up. Our machinery expense in 1938 was especially high because we began the use of a fast-moving, rubber-mounted tractor and our truck-tractor—I'm going to call this a tractor from now on. Naturally we hitched behind these strong, fast-moving power plants, our old horse-drawn equipment and it just simply "couldn't take it."

Something machinery manufacturers have got to recognize is that the fast, rubber-mounted tractor is going to demand equipment with better bearings, better systems of lubrication, and geared to work at two or three times the speed of horse-drawn equipment.

At Sunnygables we shall do more work than ever with machinery but we shall move toward owning fewer items of equipment and toward equipment, when it is obtainable, that is geared to the modern rubber-mounted tractor.

Labor

Our labor also was too high in 1938 for the work accomplished. The fault lies, however, not with the men but with the management of their time. Working scattered areas as we do, we lost too much time running around and we did not get on a good many jobs as promptly as we are determined to in 1939.

My Apologies

Thinking back about what I have written, I wonder if there is much excuse for it so far as you who read this page are concerned. Through the years, however, I have come to treat my writing here as a sort of personal diary by means of which I keep track of part of my thinking. Apparently what I have just been doing is a little thinking out loud on some of the problems with which all farmers are struggling at this time of the year. I hope you haven't minded.

Insurance Pointers

ONCE a farmer has paid premiums on his insurance policies against fire, theft and automobile liability, he naturally figures that he is protected against those hazards. Let's hope that he is, but regardless of the payment of premiums, he may very readily—and perhaps unknowingly—lose the protection for which the insurance was intended.

Take fire insurance on the farm buildings, for example—perhaps the most important form of insurance that a farmer carries. To cut down the cost of the insurance the company is obliged to insist that the farmer meet certain conditions tending to reduce the fire risk on his property, and those conditions are written into his policy. If a fire occurs, and it turns out that he has failed to meet one or more of those policy conditions, he may be entitled to receive nothing from the company except the return of his premium.

One of the factors on which a fire insurance rate is based is the structure of the building. Since brick and stone, for example, do not burn as readily as wood, the fire insurance rate on brick and stone buildings is ordinarily lower than the rate on frame buildings in the same location. Where a building is partly stone and partly frame, the fire insurance companies usually apply to it the rate for that form of construction that constitutes the greater part of the building. If the building is more than one-half stone, it will be insured at the rate for stone structures; if it is more than one-half frame, the rate for frame buildings will apply. Thus a farmer in placing fire insurance on a farm building which includes more than one type of structural material, should be careful to explain to the insurance company the type of construction of which the greater part of the building is made. If he insures the building at the rate for stone construction, and it turns out, after a fire, that the building was more than one-half frame, he will either lose his insurance protection or, at best, will receive only the amount of insurance which the premium paid would have bought on a frame structure.

Avoiding Fires

To keep down the fire hazard on an insured building a policy often specifies what may or may not be kept in the building. Most fire insurance policies limit the number of automobiles that may be kept in the building and specify certain materials that shall not be allowed in the building at all. These forbidden items often include such things as oil, gasoline and other inflammable materials. If a farmer violates any of these policy provisions and keeps the forbidden materials in the insured building, he may not be able to collect a penny of insurance if the building burns while the forbidden materials are in it.

Fire insurance policies frequently limit the duration of repairs or alterations to an insured building. For example, the policy may specify that the insurance will not cover the building if mechanics are employed in altering or repairing it beyond a period of fifteen days. Under such a condition if a fire occurred on the sixteenth day of alterations or repairs, the farmer could not collect the insurance. If extended repairs to an insured building are necessary, the farmer should obtain a written permission from the insurance company. This is usually in the form of a so-called "rider" or "endorsement" on the original policy.

Another feature of many fire insurance policies is the provision that the holder of the policy must give immediate notice in writing to the insurance company of any loss or damage for

which it is desired to make a claim. Many policies also specify that the insured must submit proof of the loss to the company within sixty days after the fire.

These conditions imposed in fire insurance policies are not intended to cause the farmer to forfeit his insurance protection in the event of fire. Their purpose is to keep down the fire hazard and thus keep down the premium rate. A farmer who wishes to do anything forbidden by his fire insurance policy can ordinarily obtain permission in writing from the insurance company, either by paying a small additional premium or in some cases for no additional charge at all.

A requirement of prompt notice is usually found in policies for fire and theft on automobiles and for personal injury and property damage arising out of automobile accidents.

Farmers with insurance policies covering liability for personal injury and property damage arising out of automobile accidents should note carefully whether the policy limits the use to which the insured car or truck is put. Thus, if the policy specifies that the insured car or truck is to be used in the farmer's business or for pleasure, he may forfeit his insurance protection if an accident occurs while the car or truck is being used in some other way. For example, if a farmer uses his truck to do hauling for a neighbor, and the accident occurs while he was so engaged, he would not be protected under a policy which insured his truck for use in his own business or farm operations.

Too Accommodating

A farmer may be led, innocently, into forfeiting his insurance protection by trying to accommodate a friend. A farmer contemplating a motor trip to a distant place may find that a friend would like to go to the same place. The friend insists that he be permitted to pay all or at least part of the cost of the gasoline for the trip.

Many automobile accident policies provide that the protection shall not be effective if the owner of the car is driving someone in the car "for a consideration." A consideration means that the farmer receives money or something of value for driving his friend—the cost of the gasoline in the case cited. If a farmer wants to accommodate a friend in this way, he had better do it without accepting anything at all for the accommodation.

A farmer caught without protection in some mishap for which he thought he was insured is in a sorry plight indeed. Yet it is not fair to expect the insurance company to take the burden of such losses, if they occur under conditions that violate the very terms of the policy. The insurance companies do not want policy holders to lose protection, but they want them to read the policies carefully and follow the conditions set forth. That indeed is a splendid rule for a farmer who wants to make sure that his insurance really protects.—C. R. R.

Information Wanted

A subscriber gave an order for calendars to an agent giving his name as Burns and claiming to represent the Sterling Specialties, Terre Haute, Ind. This company reports that they have no salesman by the name of Burns nor no salesman in their employee in the area where the subscriber lives. The subscriber describes Mr. Burns as about 45 years old, five feet, ten inches in height, weight 170 pounds, scar on one side of the face near the eye. He was driving a tan-colored car.

If any subscriber has any information which would help us to locate Mr. Burns, we would be very appreciative.

ROBERT CARDNER, (deceased) Tully, N. Y.
Mr. Cardner was hurled through the windshield of the car he was driving when it crashed into a tree, after skidding off the Cherry Valley turnpike near Cardiff, New York. He was killed instantly.

Re: Robert Cardner Policy No. N-1085937

My dear Weatherby:

Through an oversight I have neglected to acknowledge your letter of November 3d, enclosing draft for \$1,000 in settlement of the above styled policy.

I wish to congratulate you and your company upon the promptness with which you have paid this claim. It appears that the proofs were filed with your claim department on October 21st and on November 3d your draft was received in full settlement.

I thank you for the prompt attention you have given this matter.

I remain

Very truly yours,

CJK:AA

Pullets

ARE MADE out of feed

A LEGHORN CHICK that weighs an ounce and a half at birth weighs 3½ to 4 pounds at six months of age. The difference is made entirely out of feed.

Building the bodies of next winter's layers is delicate business. A weak bone, a slipped tendon, a poorly developed body—and bang! goes the chance of making a profit out of that particular pullet.

Research and Experience

Day in and day out, research workers at agricultural colleges and experiment stations are studying these problems. Some of their research is sponsored by G.L.F.; all of it is watched closely by G.L.F. Over a period of years this research has solved one after another of the problems involved in chick rearing. Today poultrymen can fill their laying houses each winter with a crop of big, sound, healthy pullets—without ever worrying about feed formulas. Because all this college research, carefully checked against results on farms, is incorporated into this formula:

G.L.F. Starting & Growing Mash

Wheat Bran	200 lbs.
Flour Middlings	500
Yellow Corn Meal	599 ¾
Fine Ground Low Fiber Oats	165
Alfalfa Meal—Low Fiber	100
41% Soybean Oil Meal	100
55% Meat Scraps	80
Fish Meal	80
Dried Skimmed Milk	60

Dried Whey	60
Ground Limestone	40
Salt	10
Manganese Sulphate	¼
Cod Liver Oil	
(reinforced in Vitamins A & D)	5

G.L.F. Starting & Growing Mash.....2000 lbs.

There is no magic in the formula of G.L.F. Starting & Growing Mash. But there is in it everything that science knows and experience shows to be necessary for growing chicks. Anybody with a shovel and a pair of scales can tack the formula up on a wall and mix the ingredients together. But it takes experienced buyers to select ingredients of the finest quality and buy them at the best price. It takes precision mixing equipment to mix it accurately as G.L.F. does, and a completely equipped laboratory to check the finished product.

G.L.F. has the buyers, the equipment, and the laboratory. G.L.F. patrons use so much of this mash that it is mixed every day, reaching the local Service Agency fresh, wholesome, and palatable.

It will take 23 pounds of feed—14 of Starting & Growing Mash and 9 of grain—to make this 1½ ounce chick into this 4 lb. Leghorn pullet.

In This Corner

"New tires put on the car now will still be practically new on April 1. Tires wear much more slowly in winter than in summer, and of course the extra traction of new tires is a big help in snow and mud." The man who made that statement is Stuart Miller, and Stuart ought to know—his job is buying Unico tires for G.L.F. patrons.

★ ★ ★

Just announced last week is a new cereal, **50-50 Rolled Wheat & Oats**. With this new product G.L.F. Family Foods Service follows its policy of providing complete marketing service on patron-grown produce. The wheat used in this original blend is selected from patrons' farms. After removing the tough outer skin, the wheat kernel is tempered, rolled, and carefully blended with rolled white oat groats. Those who have tried it find the flavor delicious and distinctive, either as a cereal or in the many baked products for which it may be used.

★ ★ ★

It's a little over two years since G.L.F. Calf Starter was introduced. Many dairymen took to this dry feed method of rearing calves right from the beginning. Some of those early Calf Starter calves now have calves of their own which are being raised the same way. G.L.F. would like to get pictures and growth records of some of these second generation calves. If you have some, please send them to—

The Editor

COOPERATIVE G.L.F. EXCHANGE, INC.
Ithaca, New York

G.L.F. is a farmers' cooperative. About 120,000 farm families in New York, New Jersey and Northern Pennsylvania are now purchasing all or part of their farm supplies through G.L.F. and many are also beginning to market farm produce through it. G.L.F. uses this page to help keep its members informed about their business.

CLOVER SEED FOR 1939 SOWING

DURING 1936 and 1937 over 400 carloads of European-grown clover seed was sown in the Central States. Some of this killed out during the winter; some of it died during the summer. In certain areas fields matured seed.

Under trade customs this seed is no longer known as foreign. It may be called Ohio, Indiana, Michigan, Illinois-grown, etc. It may even carry a U. S. Verification tag showing that it was grown in some certain state. Nevertheless the seed has the heredity of the inferior European clover, not the desirable heredity found in selected strains of North American clover.

Alfalfa seed after 72 hours in the germinator. Left, Kem-Fee treated seed. Right, untreated seed.

G.L.F. will handle none of this seed. All G.L.F. seed is grown on farms where no foreign seed was sown.

G.L.F. Seed is Kem-Free Treated

Hardy, northern-grown legumes have an extra-thick seed coat which prevents moisture from reaching the embryo to permit germination. The Kem-Fee process, developed by G.L.F., is used in the plant to soften and reduce the thickness of the seed coat, allowing soil moisture to reach the embryo and start germination.

Kem-Fee treated seed germinates as much in 48 hours as untreated seed germinates in 120 hours. It provides about six more quarts of germinating seed per bushel than is found in hardy, northern-grown untreated seed.

Effect of Kem-Fee on This Year's Legume Seed

	Before Treatment	After Treatment
RED CLOVER	70% Germination	90% Germination
ALSIKE	68% Germination	95% Germination
ALFALFA	65% Germination	90% Germination

FIVE YEARS FOR \$3.00 — THREE YEARS FOR \$2.00 — PUBLISHED EVERY OTHER WEEK

We Bought a Farm

By H. C. GRISWOLD,
A Cortland County, N. Y., Farmer

Mr. Griswold and his two sons. Gordon, at the left, is married and lives on one of the farms. At the right is Sherman, junior member of the firm. The work on the farm is done by a combination of horsepower and tractors.

IT WAS during the closing days of the World War that I first bought a small farm and endeavored to pay for it and provide a living for my family. If any of you ever tried to buy a home and get a start in the world without a dollar in your pocket to start with, you can appreciate my position. Everything I had to buy was marked at war prices. It took so much money to buy cattle and tools to equip the farm that it looked hopeless. It was a three or four year struggle to get a small dairy and the necessary equipment. During this time, prices of farm products were lowering all the time. This meant that I had to pay high prices with cheap crops.

This first farm was bought on contract, \$500.00 per year, plus interest. I had to work hard and put in long hours to get money to make my payments. Things went on this way for several years until the place was paid for. I well remember when I used to get up at four o'clock daylight saving time and work until dark. I thought that all there was to getting ahead was to work as hard as I could. This was a very foolish idea. I did not stop to plan my work, and sometimes started in the wrong direction and then had to do it over again.

Eleven years ago, I had the opportunity to buy the farm where we now live. It looked like a large debt, but it was the best thing I ever did. It was reported that I would lose everything I had; but with more volume of business and more machinery and more help it was not too bad. A neighbor gave me the best advice that I think I ever had. He said, "When it comes 6 o'clock, eat your supper and go out on the front porch and make your plans for the next day." This might look to some people

like a lazy man's way, but I believe it is the right way. When you are resting and thinking how you can do a piece of work the quickest way with the least effort, you are accomplishing more than you can with main strength. Figure how you can do it one way, then figure it out another way, and see which way will save the most labor, for labor is costly.

The greatest proposition we have to face today is how to keep our costs down to a minimum. Everything we buy is made by organized labor, and when we sell our produce we ask what the buyer will give. This is a very bad predicament to be in—buying our supplies made by organized labor, plus a profit, and then paying for them with produce at a price that a great many times is less than the cost of growing. The time to sell is when you can get a profit. It has so often been said that any one can be a farmer because the soil will give him a living. This might be all right in some cases, but a farmer must be educated to his job more than for any other occupation. He must be a good manager, he must be a good judge of cattle and horses, a mechanic to repair and operate his machinery, a blacksmith to shoe his horses and weld broken tools, a painter and carpenter to keep his buildings up. He cannot afford to hire organized labor. He must do it himself. He needs records on cost of production to know what he must get for his own labor.

The successful manufacturer knows just what a finished product costs. We as farmers should also keep records and know how much it costs to raise a certain crop, and know what

it should be sold for to make a profit. So many crops are being raised these days that do not make any money. That is also true with dairying. I believe there are a great many dairies on farms that do not pay expenses. If this is true, a record should be kept to find out what is wrong. We try to make our dairy pay all running expenses of our farm and our living expenses. One year with another, it will work out right.

Our cash crops furnish our spending money. It takes five of us to care for our 100 head of stock and to do the milking. We are fortunate to be located on land that is very good for raising cash crops, so we divide our time between dairying and cash crops work. This works out to good advantage because after caring for the stock we have the rest of the day to work in the fields and raise what cash crops we can. We usually grow about forty acres of corn for the five silos; thirty acres of oats seeded with five quarts of alfalfa, two quarts clover and two quarts of timothy seed; twenty or twenty-five acres of string beans for the canning factory; seventeen or eighteen acres of potatoes and five of cabbage. In raising these crops, the planting and harvesting time is well divided so as not to interfere with our other work.

When we get behind with our work, I find it is a good investment to hire a little more help for a day or so and be ready for the next job. If you are behind with your work, it goes to show that you have too much work for the help you have. Hire in a man for a few days and catch up. Otherwise, (Turn to Page 15)

PARTNERS

Governor Lehman Pictures State and Agriculture Working Together

IN HIS talk at the 107th Annual Banquet of the New York State Agricultural Society in Albany on January 18, Governor Lehman likened the relationship of agriculture and the state to a partnership. He outlined certain responsibilities which, except in times of emergency, both government and agriculture should discharge.

Speaking of the obligations of the state, the Governor mentioned eight distinct services to agriculture. We quote him in part as follows:

"1. Adequate Facilities for Agricultural Instruction. To meet this responsibility, the state maintains colleges of

agriculture, forestry, and veterinary medicine, six schools of agriculture, and provides agricultural instruction in 269 central and high schools throughout the state.

"2. Research and Experimentation. The New York farmer's products must compete in the rich markets of his own state with those of states a thousand or more miles away. To meet this competition he must produce more efficiently and more economically. The responsibility of the state to aid the farmer in doing this is met by the maintenance of an experimental station and yearly appropriations for re-

search in several fields.

"3. Legal Protection and Supervision. The state recognizes that it owes the same responsibility to the farmer to protect him in business transactions that it extends to citizens engaged in other professions or pursuits. Through extension of the license system to dealers in practically every agricultural product it has provided this protection. Inspectional forces under state supervision supplement this protective service and safeguard the interests of farmer and consumer alike.

"4. Maintain and Improve Distribution Facilities. The state recognizes its responsibility to assist in this respect by the financial aid and administrative supervision it gives to the thousands of miles of state, county, town, and farm-to-market roads over which the produce of New York farms can speedily and conveniently be moved. In addition it operates one of the greatest inland waterways, the Barge Canal.

"5. Market Facilities, Price Quotations and Statistical Information. The State of New York has cooperated with

local authorities in the construction and maintenance of regional markets where producer and consumer meet with mutual benefit. Uniform prices for the protection of both are assured through a state-operated teletype service supplying daily quotations to these markets and by radio to the farmers of the state.

"6. Marketing Cooperation. The services provided by the state to promote and encourage better production and more efficient distribution should be supplemented by its cooperation in the marketing of New York state products. "This it has done in providing machinery for cooperative action by farmers in the marketing of milk, our greatest agricultural product, and in stimulating its consumption through advertising. Within the last year it has also provided for the establishment of a state trademark and label to identify New York products and place them before the consumer with the state's guarantee of quality. Funds received from the sale of these labels will be used for advertising and promotion.

"7. Educational and Cultural Advantages. Every progressive government should recognize its obligation to provide equal educational and cultural advantages to all its people.

"No state in the nation has discharged its responsibility to its people in this regard more comprehensively and conscientiously than New York. Since 1918, the amount spent by the state in education has increased from \$10,805,000 to \$136,296,000. Of the \$123,240,000 total included in my budget last year for state aid for schools, \$34,500,000, or 28 per cent, was to support rural schools chiefly benefiting the children of our farmers.

"8. Stabilization of Industrial Purchasing Power. Industrial workers out of employment cannot buy the products of New York farmers, and if farmers cannot convert their crops into cash, they cannot buy the output of our factories.

"The responsibility of the state to exert its powerful influence to the stabilization of consumer purchasing power, has been recognized by the series of social laws enacted in the past few years—Workmen's Compensation Insurance, Social Security, Unemployment Insurance. There may be difficulties in the construction or administration of these agencies, but these can and will be corrected."

The Governor then discussed three responsibilities of agriculture in this partnership. First he listed farmer cooperation, pointing out that no farmer, alone and single-handed, can win his battle, either against the elements of nature or the economic forces of the world. Said he:

"We have for several years had the distressing spectacle of thousands of dairymen all engaged in the same business, all dependent upon it for material success, all facing the same problems, yet failing or deliberately refusing to join hands in a common effort to solve those problems for their several and joint benefit.

"Happily within the past year there has been some recognition by dairymen that their troubles are a common matter; that they can quickest and best be solved by common action; that the state has provided the machinery to make this cooperation effective and stands ready to give it every encouragement.

"Unless and until the agriculture of this state recognizes its responsibility to do everything in its power to help itself by cooperative farmer action, I feel it cannot truly be said that it is

Bacteria which live on the roots of legumes and collect nitrogen from the air are not equally valuable. All the clover plants shown in the picture were grown under artificial conditions so that all of the nitrogen had to be obtained from the air. The plants on the right have a good development of nodules on the roots, and, as evidenced by the size of the plants, the bacteria on the nodules did fix nitrogen from the air. The plants in the lower left corner were not inoculated, and made small growth. The interesting point is that the plants at the upper left have nodules apparently of a parasitic type. Their lack of growth indicates no nitrogen obtained from the air. All of the plants in the picture are the same age and were grown under the same conditions except for inoculation.

Grass and Clover Seed COST MONEY

*A Few Precautions That Will Assure Value Received
for Every Dollar Spent*

EVERY year a staggering sum of money is spent for alfalfa, clover, and grass seed is wasted. Either the seed fails to catch for one reason or another, or the clover or alfalfa is killed out during the winter. One of the biggest reasons for failure with alfalfa or clover is unadapted seed. For example, in 1936-37 farmers in states where clover seed is grown sowed over 400 carloads of clover seed from Europe. Seed with foreign ancestry grown last year is no longer foreign. We might say it has become naturalized, and it might even carry a U. S. verification tag showing the state in which it is grown. That seed may be American, but that doesn't necessarily mean that it is adapted for the Northeast. In fact, the assumption is that it isn't. It is important to be sure that domestic seed is grown in a state where the climate is at least as severe as it is in the Northeast.

In most years a lot of foreign seed is imported, some of which is good and some is bad. The Federal Seed Staining Act provides that a small percentage of all imported alfalfa and clover seed be stained. Violet stain indicates that it comes from Canada and that it is hardy. Green stain indicates caution, and shows that either alfalfa or clover seed comes from countries with relatively mild climates. Any seed, part of which is stained red, should be definitely out as it means danger.

Seed grown in this country does not need to

be stained, but not all of it is hardy. It is safe to buy certified Grimm alfalfa from a reliable seed house; and hardy common alfalfa grown in the Dakotas, Montana, and possibly Idaho and Utah, may be used in sections where conditions are favorable.

Most states have seed laws which supplement the Federal Seed Staining Act and which require that seed sold or exposed for sale be labeled with a tag showing per cent of germination, date the test was made, and percentage of weed seeds and inert matter. The tag gives the facts, but does not prohibit the sale of poor seeds. Any man who buys seed without studying that tag is taking a chance.

State laws are not effective in controlling poor quality mail order seeds. For example, M. T. Munn, New York State Seed Analyst, tells of an analysis of alfalfa seed from a western state advertised at \$15.60 a bushel. It looked like a bargain, but tests at Geneva showed that each bushel contained only 23 lbs. of good seed, and on that basis cost 69c a lb., where the very best hardy alfalfa seed with a high germination test could be purchased for 45c per lb. In addition to that, the analysis showed several kinds of weed seeds, some of which are considered as noxious weeds in most northeastern states. It wasn't such a bargain after all. One of the surest ways of getting good seeds is to deal with a concern that you know is reliable. (Seed

firms advertising in *American Agriculturist* are reliable.)

One way to cut the cost of grass seed when it is high and scarce is to seed less per acre. If all conditions are made favorable so that a big percentage of the seed actually grows, an excellent stand can be secured by using half the ordinary amount of seed. By good conditions we mean a properly prepared seed bed, inoculation, and an adequate supply of lime and phosphorus. In some years the nurse crop used has an important bearing on the grass crop. A little lighter rate of seeding nurse crops than is normally used helps, and getting the nurse crop off early gives the grass and clover a better supply of moisture. In one sense, peas make a good nurse crop because they come off relatively early. Cutting oats for hay instead of grain also leaves the grass in entire possession of the ground early in the season.

You may think that because alfalfa or clover has previously grown on the field you are seeding, it is unnecessary to inoculate. You may be right, but the chances are that inoculation will pay. It is not costly either in money or time, and a good many states now have laws which require that commercial inoculants be tested before being offered for sale. Most firms that sell inoculants put out products that are entirely reliable. It is wise to be sure that the inoculant you buy is not too old. You will usually find on the package the date beyond which it should not be used.

Alfalfa needs a deep, well-drained soil, and it is a waste of money to put it on ground that has the water table close to the surface. Alfalfa grows best in soils naturally supplied with lime. Lime can be added to soils otherwise favorable, but it is difficult — in fact impossible — to get lime well mixed into the subsoil, and alfalfa roots grow deep.

It is good insurance to have your County Agent make a lime requirement test. If the result shows the requirements to be less than a ton of ground limestone per acre, it can be added shortly before seeding. If the land needs more lime to grow good alfalfa, it is better to put it on several months in advance.

Red clover needs lime too, (Turn to Page 11)

Dairymen Sign Petition by Hundreds

IF YOU are a milk producer anywhere, you will not want to miss Mr. Harmon's explanation on the next page of how the milk marketing agreement works. Mr. Harmon is the sincere and able Administrator of the Agreement for the New York milk shed.

As was pointed out in our last issue, the anti-farm gang are trying to hamstring or to repeal the Rogers-Allen Act on which the milk marketing agreements in New York are based. Everybody admits that these agreements are not perfect, but they have resulted in better prices to dairymen than they have had in a long time, and if we lose them, there is a good chance of going back to the starvation prices of last summer. In the last issue of *American Agriculturist*, we carried a petition urging the Legislature not to change or repeal the Rogers-Allen Law. We have been overwhelmed with the signed petitions and letters from dairymen that have come in as a result. These petitions and letters will be put before the New York State Legislature.

On the next page we are reprinting this petition. If you are interested in having the Rogers-Allen Law continued, sign and return the petition immediately so that we can show the Legislature how dairymen really feel about this law.

Swearing at Tax Bill Won't Help

"Charles & Co., Grocers, have quit. Neither large nor important, as modern business goes, yet they had been in business 90 years. For 90 years they had employed people—found the money for the payroll—thought up new ways of getting business—paid taxes—contributed to charities—played a useful part in American private enterprise.

"But now they have quit. Burdened with taxation and regimentation—hamstrung by union regulation, they got fed up. No use staying in business just for the tax gatherer and the walking delegate. So they've given up—as others have done. The shelves are bare—the windows boarded—the place empty and silent. Liberalism has licked a business that conservatism built up. The workers are the chief victims.

"But there are other tragedies that are first cousins to the Charles case. One is the buildings torn down to escape taxation. Their cost runs into millions. Another is the railroads—the talk of government 'taking them over'. Under such 'taking over', government certainly would not pay the railroads' local taxes—you and the other taxpayers would pay them. And what kind of efficiency would you get from government-run railroads?

"Another is the growing fewness of new business ventures. Not only are firms withdrawing, like Charles, leaving men to go on relief; but energetic men, who in times past have pressed forward with new ventures, now rarely make a move. The game isn't worth the candle."

THE ABOVE, printed by courtesy from the New York State Economic Council Letter, describes better than I can what has taken place in America with small business as a result of government taxation and high pressure labor organization.

But let no farmer think that these are not his problems also. If you think that taxation is not serious, compare your last tax bill with those you paid a few years ago; and these direct taxes represent only a small part of the story. You also pay indirect taxes on practically everything you buy.

"But what can I do about it?" you say. Much! First, we can stop demanding more and more government service. Farmers, as well as every-

body else are guilty of this. Second, we can more closely watch the government spenders and snow them under with ballots 40 feet deep at election time. We can write and wire them in the meantime. Every day some new scheme goes over to spend more billions, with the result that we are handing our children and our children's children a mortgage from which they may never be able to escape. We can demand that Congress stop these great schemes and experiments that cost billions and give us a rest and a chance to catch up. Local government, which is responsible for a large part of our direct taxes, is near to you and more nearly subject to your control if you will just exercise it. But it will do no good to do nothing but swear at your tax bill once a year!

Apple Growers on the Spot

APPLE GROWERS of the Northeast face a grave situation. They grow the finest apples in the world, but cannot sell them at a living price. Every spring, hope springs anew in every grower's heart, only to be dashed again at harvest time by the same ruinous prices.

The chief reason for this, I believe, is not too many apples, that is, good apples, but the fact that people are eating other fruit, chiefly citrus. Every year more and more oranges and grapefruit are coming into production in Florida, the Southwest and California. Because of this, prices to growers of citrus fruit are ruinously low, and almost superhuman efforts have been made for years to get people to eat more oranges and grapefruit. The result is they do; they eat oranges now where they used to eat apples. Even farm folks other than fruit growers have ceased largely to eat apples the way they used to do when nearly every farm had a family orchard.

What can be done? One thing has been started in New York, for example, that will help a lot, and that is the use of the Empire State label for farm products. Commissioner Noyes and his associates in the State Department of Agriculture and Markets are to be congratulated for getting the administration of the Empire State label under way efficiently and on a sound, permanent basis. Demand by consumers for potatoes which carried this label this year exceeded the supply, and I see much hope for increasing the consumption of quality apples by the continued and increased use of this label.

But the whole apple marketing problem will never be solved until the producers themselves suffer enough to be willing to cooperate in some kind of a sound marketing organization. With such an organization it would be possible to cooperate with both the State and Federal governments, possibly by marketing agreements similar to the ones under which dairymen are now operating. It would be possible to set up standard brands and packs and to carry on a dozen other marketing practices that individual growers can never hope to do. Am I right or wrong? Let's hear from you.

We Ask a Favor

WE OF the *A. A.* staff don't like to ask favors. We would rather do favors for our readers. But there is one real favor that I'd like to ask of every member of the *A. A.* family, and here it is:

Whenever you answer an advertisement in *American Agriculturist*, or write anybody about anything that appears in our columns, won't you please always be sure to say: "We saw your ad-

vertisement, or statement, in *American Agriculturist*."

This is really more of a favor to you than it is to us of the staff, because first, our advertisements are guaranteed if you mention *American Agriculturist* when you write, and because, second, *American Agriculturist* belongs to you anyway, and when you show advertisers and others that you read the paper and patronize the advertisers, it helps us to give you a bigger and better paper.

In addition to this, any profits which *American Agriculturist* makes beyond those necessary to build a larger and better paper are given to the agricultural and home economics colleges in the northeastern states to be loaned to deserving farm boys and girls to help them get an education.

Again I ask you, when you want to buy anything, won't you look our advertisements over, and when you answer them, won't you please mention your own paper?

Hassan's Proverb

King Hassan, well beloved, was wont to say
When aught went wrong or any subject failed:
"Tomorrow, friends, will be another day!"
And in that faith he slept and so prevailed.
Long live this proverb! While the world shall roll,
Tomorrows fresh shall rise from out the night
And anew baptize the indomitable soul
With courage for its never-ending fight.

No one, I say, is conquered till he yields;
And yield he need not, while, like mist from glass,
God wipes the stain of life-old battlefields.
From every morning that He brings to pass.
New day, new hope, new courage! Let this be,
O soul, thy cheerful creed! What's yesterday,
With all its shards and wrack and grief, to thee?
Forget it, then—here lies the victor's way.

Eastman's Chestnut

A. L. DEERING, Dean of the Maine State College of Agriculture, writes the following interesting jingle about dried apples. In reply, I told the Dean that when I was a boy they used to tell me that if I ate too many dried apples and then drank water right afterwards, I would blow up and bust.

Incidentally, modern methods of preserving vegetables and fruits have the old way beat all hollow. Or don't you think so? Anyway, here is Dean Deering's letter:

"Are you old enough to remember—perhaps too old, those dried apples that used to festoon the kitchen, the attic, the front porch, or any place where grandmother could hang them to dry before making them into apple sauce and pies. I can remember my father repeating a verse or two regarding them, and although he is now 80 years old, I got him to write it out and send it to me. Here it is:

"I loathe, abhor, detest, despise, abominate dried apple pies
The farmer takes his knurliest fruit
That's wormy, bitter, and hard to boot
They leave the hulls to make us cough
And don't take half the peelings off.
Then on a dirty cord they're strung
And from some chamber window hung.
And there they serve a roost for flies
Until they're ready to make pies.
I like good bread, I like good meat
Or anything that's good to eat,
But of all poor grub beneath the skies
The poorest is—dried apple pies.

"If you or your readers can get a chuckle out of this, use it in any way that will recall 'those good old days.'"

FREE! A NEW KIND OF BARGAIN CATALOG

Jim Brown

Save Money During My 50th Anniversary Sale

For half a century the name of Jim Brown has stood for the lowest prices and highest quality in fencing, barb wire, steel posts, steel gates and other fencing equipment. Now in addition to the products of my own four big fencing and metal roofing factories, my catalog contains amazing money-saving bargains in hundreds of other articles used in the home or on the farm. My 50 year reputation for fair dealing is your best guarantee of quality, service and satisfaction.

I Pay the Freight and Postage

My catalog quotes DELIVERED prices. You don't have to figure on any freight or postage. You don't have to calculate the weight of any article or guess the distance you are from the shipping point. I pay the FREIGHT and POSTAGE. This is a big convenience to my customers—and a BIG SAVING.

What's In It

SURGE MILK COOLER

--- with **SHROUDED AIR CURRENT!**
The proved superiority of Surge Milk Coolers has come about through an exclusive new cooling principle. • • • "SHROUDED AIR CURRENT" which puts every bit of air to work cooling the entire condenser and increasing the efficiency 15 to 20% (explained in our Catalog) • **BIG ICE RESERVE** keeps the cooling water ice cold and cools the milk faster. • **FACTORY SEALED COMPRESSOR UNIT** comes to you ready to run. Does not require a refrigeration engineer. Factory-adjusted for maximum efficiency and can be installed in Factory-Made steel insulated tank or your own insulated concrete tank. Sizes: 2 to 30 can capacity. Learn how easy it is for you to own and operate one. Send postcard now!

How the Milk Marketing Agreement Works

By E. M. HARMON

Market Administrator, Metropolitan Milk Marketing Area.

WE WOULD be the last to contend that the present milk marketing plan in the New York Milk Shed is a perfect one. It is a man-made plan, and nothing short of the next world can be perfect. We do believe that the best brains in the industry and the best thought in the Department of Agriculture and Markets in Albany, as well as the best thought of the Dairy Section in the Department of Agriculture in Washington, went into making this as nearly perfect a plan as was possible with the information available.

We are just as sure, however, that improvements can be made, and that the plan can be made to work more smoothly, if we all understand each others' viewpoints and problems. Consequently, we welcome this opportunity to outline to the readers of *American Agriculturist* some of the principles and some of the problems that are confronted in the efforts to make this plan work to the best interests of the industry as a whole.

Based on Two Laws

This plan has been made possible through the enactment of two laws. We refer to the Agricultural Marketing Act, which was passed by Congress in 1935, and was amended and reenacted in 1937. We refer, also, to the Rogers-Allen Law, which was passed by New York State Legislature in 1937. Both of these laws were designed primarily to enable producers in an entire market to work together to accomplish just what many groups of organized producers have been endeavoring to accomplish ever since cooperative organizations came into the field. This goal has been aptly termed by producers in the New York Milk Shed "a living price for milk."

The plan is a perfectly democratic one. It is based almost entirely on industry support. It depends primarily for its success on the support of those who are affected. In the case of the State Order, it could not be made effective until at least 75% of the producers had voted for it. In the case of the Federal Order, a two-thirds approval was necessary. Now that it has been made effective, it can be changed in exactly the same way it was put into effect; namely, through hearings and evidence supporting the need for a change, followed by three-fourths approval by producers in the case of the State Order, and two thirds of the producers in the case of the Federal Order. Neither is it a plan which is permanently fixed upon the industry. Any time that 35% of the producers ask for the withdrawal of the State Order, it must be cancelled. Any time that over 50% of the producers ask for the withdrawal of the Federal Order, it also must be cancelled. We mention this simply to emphasize the fact that this is an industry plan, adopted and approved by the industry, and one which will succeed in proportion as the industry supports it.

Dealers Must Pay Same Price

There are two fundamental principles involved in this marketing plan. The first is that all dealers shall own their milk at the same price, according to the utilization they make of it. All dealers must pay the same price for milk used as fluid. All dealers must pay the same price for milk used as fluid cream, and for each of the other seven classifications. In other words, if the plan works as designed, dealers must depend for profits on efficiencies in processing and distribution, rather than on methods of buying milk from producers.

The second fundamental principle is that all producers shall receive the same price for the same quality of milk, location, freight and butter-

fat differentials considered. This is to be true regardless of whether a producer sells to a high utilization or a low utilization dealer. For example, the average price of all Grade B milk testing 3.5% butterfat at the country plant in the 201-210 mile zone for the month of December was \$2.02. Based on utilization, some dealers had a higher value than the \$2.02. Such dealers are obliged, under the Order, to pay their producers \$2.02 and to pay into what is known as the Producer Settlement Fund the difference between their utilization value and the average for the market. Other dealers carried a higher than average percentage of the surplus, and consequently had a lower than average utilization value. Such dealers also are required to pay \$2.02 per 100 for milk, but must depend on payments from the Producer Settlement Fund in order to be able to pay their producers the average value.

Cooperatives Don't Fight Each Other

Under this plan, producer groups are no longer tempted to compete with each other for fluid milk markets. They know that, regardless of whether or not their milk happens to be going into fluid outlets for the time being, they still will receive the same price as all other producers. Consequently, there is no need for them to bid down the price against other producer groups in order to try to get any particular market.

One point on which we have sensed a misunderstanding is that in some cases we have been led to believe that certain producers and producer groups have felt that, from now on, the office of the Market Administrator would take care of their problems for them. Nothing could be farther from the truth. There is just as great a need for farmer and industry organizations and cooperatives under this Order as ever. In fact, in the 25 additional markets where similar marketing plans are in effect, they stand or fall very largely on whether or not they have the support of the industry and, particularly, the support of producer organizations. In the event of the ultimate elimination of this marketing plan at some time in the future, I can picture no greater tragedy than the failure on the part of producer organizations to be equipped even better to carry on than they were before. We will not usurp the functions of cooperatives, farm organizations or educational institutions. We will be glad to make available to them all information possible, and to work with them in every way that we can.

The Producer Settlement Fund

There is one important provision in the Order with which we wish every producer could be familiar. That is a provision which requires that the Market Administrator shall deduct not less than \$.04 nor more than \$.05 from the total amount due producers each month, as a reserve

If You Want the Rogers-Allen Law Continued

THE OTHER NIGHT at a meeting of dairymen I heard Mr. E. M. Harmon, Administrator for the Metropolitan market, explain the New York milk marketing agreement. He did such a good job that I told him every dairyman ought to have these principles reviewed, and asked him to state them for *American Agriculturist*. So here is his brief explanation of some of the important principles on which this milk marketing agreement is based. The article will be interesting also to producers in the Buffalo and Boston markets, for the fundamental points of all these milk marketing agreements are the same.

No one can hear Mr. Harmon talk, or read his article, without being impressed with his ability and his very sincere desire to help dairymen. As he points out, the agreement can be changed or entirely eliminated if and when a majority of dairymen so desire. But the facts are that these milk marketing agreements, both in New England and New York, are helping dairymen toward better prices, and while they do, it would be a tragic mistake to permit the enemies of farmers, the selfish *anti-farm gang*, to hamstring the Rogers-Allen law on which the agreements in New York are based, and to destroy the milk marketing agreements. Such efforts are being made right now by your enemies, so if you want these agreements to continue, be sure to let your representatives at Albany know how you feel, and sign and return to *American Agriculturist*, Editorial Department R, Ithaca, New York, the petition printed on this page. We will see that these petitions are brought to the attention of the New York State Legislature.—E. R. Eastman.

fund to take care of errors and delinquent payments. If all dealers pay promptly, and there are no errors in reports, this full amount is restored the next month into the Producer Settlement Fund. If some dealers hold out, this reserve fund makes it possible for all producers to be paid anyway, unless the hold-outs amount to more than the total of the reserve fund. In the month of November, the reserve fund amounted to a little over \$131,000. Of this amount, \$76,000 was restored in the payments for December. The balance of approximately \$55,000 represented, for the most part, failures on the part of dealers to pay into the Producer Settlement Fund. Had these payments been made in full, the December price would have been \$2.04 per cwt. instead of \$2.02. It is highly important that producers understand this and all other provisions of the Order, if it is to be made most successful. Every time a dealer fails to pay his obligations into the Producer Settlement Fund, that failure represents money out of the pockets of every producer in the New York Milk Shed.

There are numerous problems in connection with the administration of this Order that deserve the best thought and study of the entire industry. The method of handling out-of-market sales which has already been referred to, and that of handling diversions as well as certain problems of nearby producers, are among the most important. We believe that at the present time, with very complete information on the receipts, the utilization, and the movements of more than 99% of all the milk in the New York Milk Shed, it should be possible as time goes on to develop better answers to some of these problems than has been possible up to the present time.

"It is Your Plan, Not Ours"

We have already indicated that no one considers this plan a perfect one. It has had splendid cooperation from most of the industry. Eighty-seven per cent. of the producers voting in the Milk Shed voted for it, and handlers of approximately 95% of the milk signed the marketing agreement to comply with the terms of the plan itself. As stated, for the most part the cooperation of the industry has been excellent. Those who are affected, however, must be the judges as to whether it is better or worse than the plans you were operating under before. You must be the judge as to whether or not you wish to continue to work with it, (Turn to Page 19)

I MOST emphatically believe that the Rogers-Allen Law, the milk bargaining agencies, and the milk marketing agreement, based on this law, should be given a fair trial, and respectfully request the Legislature to leave the Rogers-Allen Law in its present form.

A SIMPLE STATEMENT OF FACTS *about* "URAMON"

Reg. U.S. Pat. Off.

(Fertilizer Compound)

42% UREA NITROGEN

The nitrogen in "URAMON" has qualities of especial value to fruit trees. It is in the form of UREA, which is...

- 1 *Completely available*
The trees and cover crop get it.
- 2 *Resistant to leaching*
Stays put until the trees need it.
- 3 *Low in equivalent acidity*
Only slightly acid-forming. First effect is to reduce soil acidity.

"URAMON" is the semi-granular nitrogen compound developed by Du Pont. It contains 42% urea nitrogen. This high analysis makes possible a relatively low cost per pound of nitrogen, and also reduces handling and application costs in the field. It leaves no harmful residue or after-effect. The free-flowing characteristics of this material make it easy to handle and apply to the orchard. UREA NITROGEN, whether supplied in "URAMON" for areas where nitrogen only is used, or in mixed fertilizers for areas using complete fertilizers, merits your consideration because of the advantages outlined above.

FOR HAYLANDS AND PASTURES

- The same outstanding properties that make "Uramon" especially valuable as a fruit fertilizer serve to make it an excellent source of nitrogen for haylands and pastures.

WILMINGTON DELAWARE

"QUICK" Soil Tests — *Are They Reliable?*

By E. L. WORTHEN *

AT THIS season farmers begin to plan for the annual treatment of their soils, some to cure soils that have become ill; others to maintain fields in their present healthy condition. They want the best information obtainable as to the needs of the soils, and how to supply such needs most economically.

For many years agricultural workers have tested soils for acidity and have advised farmers as to the amount of lime which should be applied for best results. Occasionally, instead of lime, a soil acidifying material, such as aluminum sulfate or sulfur, has been recommended. More recently, there have appeared on the market various test-kits for making "quick tests" of the plant-food content of soils.

These tests for soil nutrients are being used extensively by extension workers, vocational teachers, and representatives of the canning and fertilizer industries. Some farmers have purchased their own testing outfits and are making their own tests. Soil testing, as a basis for fertilizer recommendations, has gained tremendous popularity within the last five years, so much so in fact that it would seem appropriate to analyze its value. Have we, as the result of these recently developed "quick tests" devised a practical and reliable means of solving the fertilizer problem?

In answering this question, it is well to remember that the chemical composition is only one of the many factors influencing the effectiveness of fertilizers. It should never be the sole basis on which to choose the fertilizer or to determine the amount to apply. Quick tests, assuming that they are accurate, might indicate a shortage or an abundance of a given plant food, but whether or not it could be applied with profit, and in what amounts, will depend on many other factors.

Tests Not Perfected

These tests have not as yet been perfected. Results on the same soil often disagree, being influenced by such characteristics as the lime content. The results have not always agreed with the fertilizer response of the soil as determined by long-conducted field experiments. These tests must be further developed, and most often be calibrated for individual soils, before the results are reliable. Even at best the results are only a rough approximation of the amount of the nutrients contained in the soil.

Possible Use of "Quick Tests"

In their present state of standardization, certain of these tests may be employed to advantage in determining the possible cause of an unproductive condition of a soil. However, to be of value in diagnosing soil troubles, they must be made by one trained in laboratory practice, and experienced in the interpretation and application of the results. In the hands of an amateur, the results may be not only worthless but actually misleading.

Tests for Phosphorus and Nitrogen

So far as is known, all the agricultural soils of the Northeastern States

* Professor Worthen, of the New York State College of Agriculture, is a well known authority on soil fertilization.

Many things affect the manner in which crops respond to fertilizer. Picture was taken on farm of Dean Waller, Liverpool, N. Y.

respond to phosphorus. A phosphatic fertilizer material, such as superphosphate either alone or as part of a mixed fertilizer, is essential in their economic fertilization. The fertilizer industry has long recognized this fact for their mixed fertilizers have always contained a large proportion of phosphoric acid, often as much or more than of nitrogen and potash combined. In one state where "quick soils testing" is being done, the agricultural workers advise the use of phosphorus, irrespective of the results of their tests, and, no doubt, in so doing they are giving sound advice. In another state where such tests are extensively used, the application of phosphorus is advised, except where tests indicate the soil is well supplied with both phosphorus and potash, under which conditions workers recommend that no fertilizer be applied.

A claim often made for these tests, is that they have a desired "psychological" effect on farmers. They convince the farmer that his soil is deficient in some plant-food element and, therefore, it is imperative that he use fertilizer. Granting that fertilizer can be used to advantage on all the agricultural soils of the Eastern half of the United States, and there are few who will argue otherwise, still it is doubtful if the object sought justifies in this case the means employed to secure it. At least, farmers would prefer to have less psychology and more practical science back of recommended practices.

With the universal response of soils to an application of phosphorus, it should require no soil test to convince one that phosphorus should be supplied; and since fertilizer is the only adequate source of it, the need of applied phosphorus is obvious. In the case of nitrogen, which, likewise, is deficient in virtually all soils which have been farmed for a decade or more, the situation is somewhat different. Farmers are not entirely dependent on fertilizers for nitrogen. It may be supplied by growing legume crops, applying farm manure, and producing and plowing under green manure crops. The real nitrogen problem is how the inadequate soil supply of this element can most economically be increased.

Need for a Reliable Potash Test

Soils are not universally deficient in potash. Some are just as much in need of this plant food as they are of either nitrogen or phosphorus. It is known that a potash deficiency occurs most frequently in muck and in sandy and gravelly soils. Other soils, especially when the general fertility level is low, may be expected to respond to potash fertilizer.

Unfortunately, the potash response
(Continued on Page 11)

A FEW MILES east of the Delaware, where the Old York Road crossed a trail to Trenton, John Ringo built a hut in the wilderness. That was 1720. John's cabin became the first public shelter between Elizabethtown and the Delaware River. The settlement became Ringoes.

Over the Road from both ways came travelers—some to look and move on, some to trade or to build. But most were intent on clearing the land—intent on becoming freeholders in a new country. One of these was Jacob Kase, a farmer, and a good one.

Jacob came to stay. He liked the land just east of Ringoes, where the Old York Road follows the rim of rolling Amwell Valley. This was about 1750, and Amwell Valley settlers were already prosperous. Neshanic Creek was lined with mills for lumber, flour and cloth. On Pleasant Ridge stood a church, and a mile away, at Larison's Corner, was another. Amwell settlers had already learned how to live as well as make a living.

Below the rise, south of Reaville, Jacob chose a strip with improved meadow. Some 20 years earlier, 290 acres of this good land sold for 174 pounds "lawful silver of the King's Dominion." The same land was worth more now. Jacob borrowed the money to buy it, and he built a home on the Neshanic. Year in, year out, he saw little hard cash, but he needed only a little over what it took for the mortgage. Here was his independence. Here he became a freeholder.

* * *

Jacob's boys were strapping men when trouble hit the countryside. War! Home and liberty to be defended. Kase boys joined the Patriots, leaving father and mother to tend the farm. Hard times

Near Reaville, N. J., stands this home on land that Jacob Kase bought and started to develop about 1750. Today it is owned by the sixth generation of Jacob's descendants—Cruzer Polhemus. Cruzer's son and son's son are the seventh and eighth generations. Two hundred and ten years ago 290 acres of this land sold for 174 pounds.

"This Indenture" was written in 1729 with a quill pen on sheepskin. Still readable and well preserved, it deeded 290 acres of land on Neshanic Creek in what is now Amwell Township of Hunterdon County, N. J. Some 20 years later Jacob Kase bought this tract and built a home.

dogged the freeholders. Prices went up but taxes soared.

In early December of 1776 General Washington's troops came streaming westward and hurried across the Delaware in retreat. Gloom struck even the stout-hearted. But on Christmas night, while mothers prayed, 2400 Patriots came back, through a blinding storm, to capture Trenton and a thousand Hessian mercenaries. Not for five years did the British surrender, but Trenton was the turning point. That was New Jersey's proudest Christmas.

Some boys who joined the war saw farms they liked so well they never went home. Not so with Jacob's sons. The same rolling meadows that made Jacob Kase a freeholder still mean independence and opportunity to Jacob's descendants. Cruzer Polhemus, the present owner, is the sixth generation. Cruzer's son and his son's son are the seventh and eighth. In 1939 the old homestead is again free and clear.

* * *

Three times in the past century this farm and home have changed hands. Three times a new generation bought out the one before. But in a hundred years it never sold for less than \$7000 nor more than \$8000. Each time it paid for itself again as each owner won his independence anew. Where other generations made butter and fattened cattle, Cruzer Polhemus now produces milk and eggs. But the farm still grows most of the grain for its flock of hens and its herd of cows.

New days have brought some new ways

to Amwell Valley farming, and to the agriculture of the entire Northeast. But thrift and hard work are still the first demands. Independence and opportunity are still the great rewards. Durable is the land, resourceful its people, and rich is the life they live.

This is one of a series of articles published as

*An Expression of Confidence
in Northeastern Agriculture*

* * *

About half the farms of the Northeast are owned free and clear. The others are mortgaged; and the greatest risk to their owners is the chance of losing what progress they have made.

For some 30,000 farmers of New England, New York, and New Jersey, the Federal Land Bank is providing a type of mortgage financing that gives the greatest degree of safety. Land Bank mortgages require only small payments in any one year; they provide for a long time to pay out, if it is needed; they don't come due in a lump sum and therefore don't have to be renewed.

"Safe Financing," a free booklet, describes these farm mortgages in detail. Write for your copy.

The Northeast is a Good Place to Live

A Ton of Freight moved 100 miles *to buy each tie in this picture*

FARMERS work as hard for their money as anybody in America.

But railroads work hard for their money too.

For instance, to take in enough to pay for one crosstie ready to put in the track—a ton of freight must be hauled, on the average, more than 100 miles.

That doesn't mean that the profit on hauling a ton of freight 100 miles is enough to pay for a tie, because we're not talking of profits—we're talking of the total amount the railroads receive.

On this same basis, a ton must be hauled three miles to buy a postage stamp—or five miles to buy a nickel lead pencil.

A railroad spike takes the income from hauling a ton of freight a mile—and to buy a 100-pound steel rail 39 feet long takes the total income from hauling a ton of freight 2,500 miles—farther than the distance from Chicago to San Francisco.

When you realize that American rail-

roads haul an average ton of freight one mile for about one cent, the marvel is that they are able to provide such safe, dependable, fast transportation—the finest service in the world. No other transportation agency gives so much for so little.

And in order for the railroads to keep on providing the dependable and economical transportation service which American farmers and industry must have, they need common-sense treatment such as this:

Treat the railroads as a business. Give them reasonable freedom to "price" their only product — transportation service. Give them greater freedom to adjust rates to meet competitive situations, to adjust services to the demands of traffic; and to adjust expenses to the condition of their business. And give them equality of treatment and opportunity — equality with other forms of transportation in matters of regulation, taxation, subsidy and the like.

This common-sense treatment which railroads need is outlined in horse-sense terms in a brief pamphlet. Write today for your copy.

**SAFETY FIRST—
friendliness too!**

If there is no Sundial dealer near you, write Sundial, 21 Hudson St., New York City

SUNDIAL WORK SHOES

NEW YORK BRANCH INTERNATIONAL SHOE CO., INC.

LAST fall we planted one cherry tree, one quince and four grape vines. These were to take the place of some we planted two years ago and which were winter killed.

While we were at it, we planted also two Rose of Sharons and a Bleeding Heart. These were original investments.

Ours is a pretty old farm, as farms go in a country that was not settled until after the Revolution. Some of the farm buildings are well over a hundred years old, and the orchard (so people tell us who ought to know about such things) is equally ancient of days. It's still bearing well, but no expert testimony is required to tell us it won't last forever. So when we moved onto the farm two years ago, we put a new roof on the barn and set out some 40 little fruit trees back of the house and a few grape vines, just so they'd be coming along to take up the work when the old orchard inevitably couldn't carry the load any more. Apples, peaches, pears, quinces, nectarines, cherries, Niagaras and Concord! Most of them have been doing splendidly, but in spite of our care some nameless pestilence or the cold or something afflicted a cherry tree and the quince and a few of the little grapes. Hence, the replacements that we put in last week.

While we were planting those trees—digging holes, lugging buckets of water, working the fine dirt in around the roots, and tamping it down—a newspaper man we know (not a farm paper) came out to see us and they sent him down to the new orchard where we were working, on our hands and knees mostly. He got sort of interested, and asked a lot of questions. How much did it cost? How many times a year did we have to spray? How much did that cost? How many years would it take for those trees to bear fruit in any substantial quantities? On the basis of life insurance figures, what were the chances of our being around to enjoy any of that fruit, let alone make any money out of it? Wouldn't it be cheaper to buy quinces at the A&P on the extremely rare occasions when any rational human being wanted anything as silly as a quince?

To hear him talk, you'd think we were just itinerant buckwheat farmers—here today and gone tomorrow. Probably there never were any little fruit trees planted as firmly as those of ours last fall, because all the time the newspaper man was talking, we weren't really tamping dirt in around the roots with our bare fist; what we were really doing was busting him on the nose and deriving much spiritual benefit from the experience.

My goodness gracious! If the people who lived on our farm a hundred years ago and more—Lees, Jewels and Harrisons mostly—had figured the way he did, there wouldn't be any farm now. They would not have framed the corn crib in huge, oak timbers, or built the bridge over the brook with stone slabs, or planted maples and apples and roses and lilacs that have already survived their authors a matter of four generations. No sir, they'd have just scratched the top, broadcast some seed, gath-

ered a meagre crop, and then moved on West to repeat the operation when the yield began to dwindle with the impoverishment of the land.

No, sir! They weren't that kind of people, and we don't want to be either. They were, we suspect from the looks of things, more the kind of people who, when they got too old to plow and reap, put in their time planting and making things that last longer than farmers do, who still have an unfortunate tendency to run down, slow up, and stop around 98.

We've been on the farm now less than three years, but long enough to have gotten our feet under us and to have turned over clover sod of our own seeding. That's about where one starts farming on his own account; up to that point, he's still taking out what other people put in.

Old friends drive out to see us now and then on Sunday afternoon, and the first question they're apt to ask is whether we're making the farm pay. We have to tell them, of course, that so far about all we've gotten out of the place is a bare living, food, lodging, heat, light, water, and washing.

"But just step outside and see what we've put into it. We've cut out and burned close to a mile of hedge rows, and we've drawn over a hundred loads of manure onto that one field alone, and I don't know how many tons of lime we've spread on the whole place, and we've pretty well discouraged the thorn apples and wild roses that were growing in the pasture."

Of course, we want to make money—more money than it takes just to keep going and pay taxes—but we are neither impatient nor too querulous as bookkeepers. We're working, as we've told you before, on the broad principle that if we take care of the farm now, the farm will take care of us later on, returning everything we've given the land—filled up and running over. Anyway, that's what has always happened up to now, and there's nothing to indicate that basic things about the land are going to change much.

But there is more to farming and
(Continued on Page 29)

CHARLES M. GARDNER

Editor of the National Grange
Monthly and High Priest of De-
meter of the National Grange.

ERIE COUNTY, New York, was recently the scene of an interesting Grange event, when Erie County Pomona planted a beautiful tree on the county fair grounds near the building in which the Granges stage their competitive exhibits for the fair each year. An impressive ceremony marked the event, and the various subordinates of the county were widely represented. Several subordinates in Erie County make a regular practice of planting trees and doing other community work of beautification character.

THE FIRST new Grange of the year to be organized in Maine has just been completed in Hancock County—Mt. Cadillac, No. 564. The new group comprises 55 charter members, and Deputy Roland Salsbury of Ellsworth Falls was the organizer.

MUCH INTEREST was created at the recent session of the New Hampshire State Grange at Laconia when it was learned that one of the deputies, Herbert Marshall of Lancaster, had flown to the convention instead of going by the slower and ordinary means of transportation. Deputy Marshall is a thorough believer in "up-to-date Grange work" and so decided to set an example of quick transportation for his fellow deputies.

C. PALMER CHAPMAN of Westerly has just retired from the Executive Committee of the Rhode Island State Grange, rounding out 12 years of consecutive service in that position, to which he was elected when he closed his labors as Master of the Rhode Island State Grange. Mr. Chapman is one of the most active Grange leaders in Rhode Island, and has been for many years Priest Archon of the Assembly of Demeter.

THE GRANGE in New Hampshire has rarely tackled a more ambitious project than the Farm Products Show which was staged at Laconia in connection with the 65th annual session of the State Grange. More than 75 exhibitors entered nearly 350 different exhibits, and the big state armory at Laconia proved none too large adequately to house the show. Besides the Grange, 10 active 4-H Club county organizations participated, and other groups and state departments were represented. The quality of the products was

very high, and the show was such a decided success that it has been decided to make it an annual event.

MRS. STELLA F. MILLER, New York State Lecturer, is laying plans for the regional conferences of Grange Masters, Lecturers, Secretaries and Juvenile Matrons, which will be arranged by counties to cover the entire state, bringing together a great host of leading Grange workers.

TWO NEW State Grange Masters have just assumed their tasks following December elections: In Pennsylvania, Kenzie S. Bagshaw of Hollidaysburg takes the helm as the successor of J. Audley Boak of New Castle. In Rhode Island, William B. Babcock is succeeded by Fred J. Kennedy of Greene. Messrs. Bagshaw and Kennedy are long-time Grange workers, widely known and highly esteemed in their respective states.

AN INTERESTING feature of the session of the Massachusetts State Grange at Boston was the announce-

ment by State Master Everett W. Stone that William Casey, State Commissioner of Agriculture, had been appointed a special deputy of the State Grange. The announcement was made following Commissioner Casey's evening address, and it was a complete surprise to him when State Master Stone invested him with a bright, new, shining deputy sash. Commissioner Casey is a past master of both subordinate and Pomona Granges, and a lifetime member of the Order.

IN CHESHIRE Grange, Connecticut, Walter Baldwin declined reelection this year as treasurer, after having served the Grange in that capacity for 34 consecutive years. Few treasurers have served their Grange longer or more faithfully than Mr. Baldwin.

A NEW ENGLAND Grange event of great significance was held Saturday, January 28, when all the State Masters, Lecturers and Secretaries, with Executive Committees, Home and Community Service Committees, Juvenile workers and other leaders from

I Shall Have Time

By Elizabeth Wells Webster.

When they are grown I shall have time
To do the things my heart has craved:
To write, to sing, to laugh and play,
To read good books and study more
In some small place all by myself,
With all my treasures gathered near,
Books and keepsakes and the like
Accumulated year by year.
By my small fire I'll sew and read,
And write the songs my heart has sung,
The songs that for so many years
Like muted chimes have been unring.

At last they're grown and I have time
To rest and dream and write alone:
I cannot write, I dream no dreams—
Songs have no lilt when you're alone.

Only.

FARMALL

Brings You All of These VALUABLE FEATURES

• SCORES of valuable improvements have been made in FARMALL tractors since the original FARMALL revolutionized tractor design 16 years ago. The greatest all-purpose tractor value on the market is today's FARMALL. If you want power, insist on smooth, 4-cylinder FARMALL power, with valve-in-head efficiency and economy. If you want beauty, insist on the useful beauty of

FARMALL power and performance. If you want accessibility, insist on the convenience of FARMALL's simple, uncluttered design. If you want to be sure, insist on the RED TRACTOR—the one and only genuine FARMALL. On display in McCormick-Deering dealer and Company-owned branch showrooms everywhere. DIBBLE'S tested FARM SEEDS

**Alfalfa . Grass Seed . Corn . Soy Beans
Clover . Oats . Barley . Seed Potatoes**

In 1938, many varieties showed productions even greater than the 1937 marks. These include sweet clover, alsike, barley and alfalfa. But big production doesn't mean **QUALITY**. Nor does it mean the hardy acclimated seed you need. It does mean that with lower prices, no one should be deprived of the best quality obtainable — Dibble quality!

Seed of unknown origin must be avoided. All Dibble seeds are of known origin and all are northern grown.

Hardy northern grown Alfalfa is limited in quantity this year. Choice Seed Oats will be in demand. Potatoes need watching—good ones will be scarce. We have excellent stocks of all of these, as well as other seeds.

Take advantage of our knowledge of farm seeds which is based on years of intensive testing and proving on our 1000 acre experimental farm. You can't lose with our "10-day-any-test-you-want" guarantee which backs every bushel we sell.

DIBBLE'S HEAVYWEIGHT OATS—The most productive American Oat. 40-42 lbs. per bushel. Avoid untried sources.

DIBBLE'S SEED CORN—Germination 95% or better. Test it yourself. All the leading varieties.

One Quality only—The BEST. Prices lower than you'd expect for such Quality. Get the DIBBLE Catalog and Price List FREE. Send name and address on a 1c post card.

1939 CATALOGUE now ready

TWO GOOD WATERMELONS — Klondike and Striped Klondike.

New Vegetables

By PAUL WORK

EGGPLANT is a mighty nice vegetable but it will not withstand frost in spring or fall, and early varieties are valuable for the North. We have had fairly early sorts for a good while but they were not nearly as nice as the standard Black Beauty and New York Purple so Professor J. R. Hepler

Paul Work

of the New Hampshire Experiment Station tackled the job. Out of a cross between Black Beauty and Early Dwarf Purple, he gained an imposing array of strains, — some superior in one respect and some in another. After eight or nine years of selection "New Hampshire Hybrid" is available to the trade and it is a good eggplant. It is

early, has good plant growth, the fruits are smooth, oval, well colored and of a desirable medium size. It received the highest number of votes of any entry in the 1938 trials and was awarded Silver Medal under "All America Selection."

SWEET CORN

Connecticut Experiment Station has announced good prospects for 3 way hybrids of merit among the early sweet corns. Hybrid seed from inbreds is detasseled and pollinated with a third inbred. This means considerable advantage in the production of market seed.

GEMCROSS 6 and 13 are showing up nicely for early varieties. COCKCROW

is one of them. These fall in the 60 to 65 day class under favorable conditions, have 8 to 12 rows of yellow kernels with ears of 6 inches average length or a little better. SENECA 60 may be a trifle earlier but has more slender ears and mostly 8-rowed. It has won considerable favor in the last two or three seasons.

WATERMELONS

1938 at East Ithaca was another good watermelon year. A huge crop was harvested from some 30 varieties. No special effort was made for earliness as we wanted the melons for field days and class work in September. Seed was sowed May 18th under Hotkaps and the first melons were harvested August 13th with a number coming in within a few days. Materially earlier maturity could have been achieved by sowing seed under Hotkaps

somewhat earlier, by starting plants in the greenhouse or by combining hot-house plants with Hotkap culture.

The only change in previous recommendations about varieties would be to put a bit more emphasis upon SWIKA or CANADA EARLY or EARLY MARKET QUEEN which seem to be about alike. These are almost as early as Honey Cream but have red flesh and somewhat tougher rind. They are nearly round, with light green ground color and faint stripes. They are about the same size as Honey Cream or a little smaller. Old recommendation of HONEY CREAM for earliness and quality still holds as does suggestion of EARLY ARIZONA and EARLY KANSAS to come in a little later. A good many have been having fine success with KLONDIKE and even the southern late varieties have been coming through very nicely. We had a 40 pounder — lacking half a pound — at East Ithaca last summer. This was a Watson — one of the long, narrow, dark green sorts so widely grown in the South.

Some challenge the watermelon enthusiasts with the idea that we may not have as warm summers during the next five years as we have had in the past five. Muskmelons have been well established and seldom fail. Today, we have watermelons as early as muskmelons and somebody, the other day, solemnly informed the writer that Honey Cream is 10 days earlier than the Bender muskmelon. That is a bit more than I have been able to say on my own initiative but it would seem that there will be few years when there cannot be at least a 4-week season for harvesting watermelons in the bulk of upstate New York.

NEW POTATOES

Two new potatoes have appeared on the scene. EARLAINE resembles Katahdin in shape and appearance but is as early as Cobbler. It was developed in Maine by the United States Department of Agriculture. Seed for 1939 plantings does not seem to be available but growers will be watching it where trials are held. Sebago is a new late variety showing blight resistance and good table quality. It yielded well in 10 county tests last season. Here again, it is doubtful if any considerable amount of seed is available.

Try Them Out First

As usual, warning is sounded against making extensive plantings of new things even though seed is available. Small trials ought to precede any changes in regular planting plans.

Don't Gamble!
USE NITRAGIN INOCULATION FOR ALL LEGUMES

Nitragin inoculation often increases the yields of ALFALFA, CLOVER, SOYBEANS and other legumes by 50% or more. It makes more and richer feed...enriches the soil with nitrogen and organic matter.

DON'T USE SUBSTITUTES
 Don't take a chance on ordinary or unknown inoculants. NITRAGIN inoculant has been bred up by 40 years of scientific selection...proved by 40 years of practical farm use. It's the original tested, branded and dated inoculant—billions of bacteria packed in every can. Sold by leading seed dealers. Don't accept substitutes—insist on NITRAGIN. Now—lowest price in history.

VALUABLE BOOK FREE
 Tells how to grow better legumes for bigger yield, better feed, surer soil building. Just write for "LEGUMES FOR PROFITS."

L. J. FARMER, Dept. A.A., PULASKI, N. Y.

Certified Raspberries—Taylor, Indian Sodus, Newburgh, Latham, Chief, St. Regis, etc. Strawberries, Asparagus, Grapes, Fruit Trees, Shrubs, etc. All guaranteed. Prices low. Catalog free.

BAKER'S NURSERY, HOOSICK FALLS, N. Y.

SODUS raspberry plants, large or small quantities; also red varieties and strawberry plants.

EUREKA PLANT & BERRY FARM, Maple View, N.Y.

Cornell's annual bulletin entitled "Varieties of Vegetables for 1939" will be available through County Agents in the course of the next few weeks. This will give plenty of time to procure samples for trial. County Agents will have lists of sources of the new things or inquiries may be directed to *American Agriculturist*.

(To be Continued)

Grass and Clover Seed Cost Money

(Continued from Page 3)

although it is not quite as particular as alfalfa. If you are enrolled in the Agricultural Conservation program, you will find that the addition of lime is one way to earn credit for agricultural conservation payments.

Clover and alfalfa need phosphorus. A sort of blanket recommendation when seeding alfalfa is 500 lbs. of 16 per cent superphosphate or its equivalent per acre. You will find that this, too, will qualify you for soil conservation payments. Check the approved practices for your state for exact specifications.

In seeding alfalfa, a good many farmers prefer to work the land occasionally during the spring to kill weeds, and then to sow the alfalfa without a nurse crop some time between June 15 and July 15. Then, if weeds get too much of a start, they can be clipped with a mowing machine. Others seed with a nurse crop of oats or barley, but seed lightly, some not using over a bushel of oats or barley per acre.

The spring of 1940 will see the usual number of new seedlings where the catch of clover or alfalfa is so poor that it is necessary to plow up and re-seed, but the man who uses good hardy seed, prepares a good seed bed, inoculates, and supplies adequate amounts of lime and phosphorus is likely to find his barns full of hay a year from next summer.

"Quick" Soil Tests

(Continued from Page 6)

of many important agricultural soils is not known. There is real need of a simple, reliable test for available potash. Such a test, perfected so that following out the results of the test will cause a satisfactory crop response, should prove of great value in determining when fertilizer potash is needed for permanent pastures, low-value field crops, and possibly for fruit. In the fertilization of vegetables and other intensively produced high-value crops, potash fertilizer can generally be justified, irrespective of the potash supply of the soil.

Will Not Tell Analysis of Fertilizer to Use

No form of soil analysis will give the necessary information for determining the most profitable analysis of mixed fertilizer to use. Neither will it enable one to determine the desired rate of application of such fertilizers. Unfortunately, "quick soil tests" are being extensively used to obtain such information. Farmers are led to believe that the fertilizer recommendations based on the results of a test of their soil are correct beyond question.

There are many factors other than soil composition which must be considered in selecting fertilizers. Among them may be mentioned the character of the crop, the application of manure, residual effect of previous fertilizer applications, cost of fertilizer, rate of application, frequency of legumes in rotation, crop prices, and value and tenure of land. In fact, the development of an economic system of soil management, including the selection and use of commercial fertilizers, is one of the farmer's most difficult problems, and it will not be greatly simplified by "quick soil tests."

I'M PLANNING MY MILK PRODUCTION THIS YEAR—BREEDING MY COWS NOW SO THEY'LL FRESHEN NEXT FALL

Cows bred now will be freshening in the fall when the milk supply is short. In this way farmers help to regulate production, and they help themselves, their neighbors and their distributors to solve the annual problem of marketing surplus milk in spring and early summer.

Sheffield, too, devotes its efforts to solving the surplus problem by promoting the sale of more milk and cream to more people. This is in addition to its job of transporting, testing, bottling and delivering high-quality milk.

By J. F. "DOC" ROBERTS

WHERE can I purchase feeding cattle and calves? What will they cost? What will calves weigh? How many will there be in the car, and what will it cost to buy and ship? These questions have been so numerous and come from so many different locations that when I finally received one from Augusta, Maine, I decided to see if I could not briefly answer them here.

You can safely purchase them from any bona fide commission or buying firm, which is bonded and operates under the supervision of the Packers and Stockyards Act. There are a number of such firms on every large market, but Kansas City and Omaha are the two largest feeding cattle centers. Positively, do not buy from country points anywhere in the West, except possibly as purchased through one of the responsible and bonded firms. Choice steer calves would cost about 9½¢ a pound out there now, but no man in the Northeast is really interested in this class, unless he plans to carry them over a year and has a world of grain to keep in front of them at all times. The next grade can be bought for about 8¢ a pound and are a very desirable kind to winter through, put on grass next summer and then finish off with a reasonable amount of grain. These are both quotations on white-face calves. Durham or shorthorn calves can be bought around 7½¢ a pound, in lots of ways are just as good, but are not as attractive to look at, and generally will not make quite as rapid gains, or put on quite such a quality finish.

Heifer calves of these three grades sell around \$1.00 a hundred less than steer calves, although when you get down into a lower costing animal, the spread between heifers and steers is not generally over about 50¢. The proper time to buy these calves is from the first of September to the middle of November, as most of the calves after that time have been moved from the range, and also after that time, the weather is such that there is greater danger from shipping fever, colds, etc. Then too, earlier, calves can be bought as light as 300 lbs., and later it is hard to get them weighing under 400 lbs. They put approximately 50 of these calves in a carload. The freight rate from Kansas City or Omaha is 69¢ a hundred. Your local agent can give you the through rates, which to most any section in the Northeast will be less than \$1.00 from either of these

markets. I am sorry there is not space here to go into the various weights and prices of other types of feeding cattle.

Another question that we are continually being asked is the "electric fence situation" and I am pleased to be able to tell you that Professor H. W. Riley of the New York State College of Agriculture, Ithaca, N. Y., has gotten out a bulletin by that very name, and I believe that if you write and ask for Mimeo. Bulletin No. 453, that practically every question that you could possibly ask about electric fences will be answered for you. Believing that the electric fence has a very great value, and an increasing value to the farmers of the Northeast, I hope many of you will get this bulletin and read it carefully. It is the finest thing I have yet seen.

More and more, all authorities are becoming convinced that the care and feed that any animal gets while carrying her young have a greater ultimate effect on the growth and quality of the matured offspring than care and feed given at the time of birth. This is timely; feed is cheap, and experience has taught me that it is true.

EVERY class of livestock is meeting with a good demand at prices, in most cases, higher than generally anticipated in trade or slaughter circles. Another surprise development is that producers and feeders are showing an inclination to move their livestock at these prices, in spite of low-cost feed. This is always a good sign because if the principle of "market your livestock when it is ready for market" continues, we will have no "spring glut" and we will all show a livestock profit straight on through the season.

Horses are at least \$10 to \$20 higher than the low time this fall, and will not be too plentiful or too cheap this spring. Choice cattle bring up to \$12.25, with good state steers generally \$9 to \$10. Cows and bulls are fully as active and high, and what an opportunity to cull out cow herds, and cull hard and deep. Lambs still hover around the \$10 mark, regardless of heavy marketings, and calves are up to \$13 today. Hogs up around \$8.50, if not too heavy, or might say, "lardy", for with our exports of lard so diminished, and with all the "lard substi-

(Continued on Page 21)

THE 50 YEAR FIGHT FOR A LIVING PRICE FOR MILK!

The Aims of the Dairymen's League and How They Are Being Accomplished

The Dairymen's League—an organization of farmers, owned and controlled by farmers
—is dedicated to obtaining the following benefits for farmers and consumers:

- 1—A living price for milk for farmers.
- 2—Fair treatment to producers in the weighing, testing and delivery of their milk.
- 3—A better bottle of milk for the consumer at a reasonable price.
- 4—Keeping control of the price of milk in the hands of farmers.
- 5—Keeping profits to dealers on a fair and reasonable basis.

Milestones that Have Been Passed—Battles that Have Been Won in the Steady March Toward the League's Objectives

Every step in the League's march toward its objectives has been so bitterly opposed . . . every accomplishment has been so clouded in the smoke of battle and propaganda . . . that many outside the League have lost sight of the objectives at the end of the road. They have become so interested in today's fight that they have failed to notice the long distance that has been covered in the League's march forward. Here is a list of important milestones passed—a record of which every dairy farmer can be proud.

PROTECTION OF PRICES AND MARKETS

1. Smashed the dealers' strangle-hold on dairy farmers of the New York Milk Shed by the victorious strikes of 1916 and 1919.
2. Established a system of selling milk according to use, and of blending the proceeds to members, thereby setting up a plan in which all farmers could share the fluid markets.
3. Sought control of surplus by owning and operating its own plants, and using this control plus the classified price plan to stabilize prices and markets for all producers in the milk shed.
4. Fought continuously the entry of bootleg milk into the market.
5. Promoted a program for better quality milk.
6. Fought entry of western milk into the New York Market. Prevented widening of milk shed in 1927, thereby assuring adequate milk supply during low production periods.
7. Obtained reduction in freight rates on milk, in some instances almost one-half.
8. Cleared the way for true farmer representation in the milk industry.

MADE FARMER'S VOICE HEARD IN STATE LAWS

1. Demanded enforcement of laws requiring bonding of dealers.
2. Supported law for licensed milk testers.
3. Presented bill passed by Legislature enabling farmers to organize in cooperative marketing associations.
4. Successfully fought attempts to repeal foregoing bill.
5. Successfully fought Pennsylvania bill which would have turned cooperative marketing organizations over to State.
6. Fought for Federal-State Marketing Order.

FEDERAL LEGISLATION GAINED AND DEFEATED

League leaders have been in the forefront of farmer activity concerning the following Federal legislation:

1. The Capper-Volstead Act, authorizing cooperative organizations of farmers.
2. The Voight-Ladd Anti-Filled-Milk Act.
3. The Lenroot-Tabor bill protecting dairy farmers against imports of low-priced, low-standard milk.
4. The Brigham Act forbidding statements or packages designed to make a vegetable oil product appear as nourishing as butter.
5. Opposed tariff cuts on Canadian dairy products.
6. Fought for amendments in Farm Bill to give dairy farmers greater protection.
7. One of the first farm organizations to favor revaluation of the dollar, thereby easing the load of the depression on farmers.
8. Supported amendments to the Agricultural Adjustment Act authorizing AAA to cooperate in marketing agreement.

PROMOTES THE FARMER'S INTEREST IN MANY FIELDS

1. Has always advocated use of butter and opposed misleading advertisements for substitutes.
2. Has taken a strong stand, backed up by practical action, for consumer protection—for clean milk production, high quality milk, clean, healthy herds, modern milk houses and stables, and better breeding.
3. Has published a farmers' newspaper every week for 20 years, presenting valuable information on marketing, farmer cooperatives, and modern methods of milk production, breeding, feeding, etc.
4. Has accumulated important facts and figures regarding marketing in the New York City and other markets, and has made these available—for the first time in history—to dairy farmers.

AND NOW, IN THIS ADVERTISEMENT . . . The farmers of the Dairymen's League make available the inspiring record of what the League has accomplished for farmers generally. It is a record studded with accomplishment. A record which shows the practical value of cooperative effort, proving conclusively that what benefits one farmer benefits all farmers. The Dairymen's League is really serving all farmers in their fight for a Living Price for milk.

THIS STATEMENT IS PUBLISHED BY THE 30,000 DAIRY FARMERS WHO OWN, OPERATE AND CONTROL THE DAIRYMEN'S LEAGUE CO-OPERATIVE ASSOCIATION, INC.

NORTHEASTERN *Slants* ON THE *National* NEWS

■ Taxes Should Be Everybody's Worry

PRESIDENT ROOSEVELT has again asked Congress, "in the interest of equity and justice" to taxpayers, to pass a law banning tax-exempt securities and making it possible for government to tax salaries of government employees.

"Those who earn their livelihood from government," said President Roosevelt, "should bear the same tax burden as those who earn their livelihood in private employment." Statistics show that there are 65 billion dollars' worth of tax-exempt securities issued by Federal, State and local governments, and that the salaries of 2½ million government workers are tax free.

Proposed tax on income from government securities would apply only to future issues, though Treasury estimates that a half-billion dollars worth of those outstanding in private hands might eventually be refunded into taxable issues.

Last April, President made same request, but objection was raised on grounds that constitutional amendment would be necessary. President holds that a "short and simple statute" would be sufficient, since Congress has constitutional power to tax income from "whatever source derived."

Besides equalizing tax burden and eventually adding an estimated 300 million dollars to government revenues, it is felt that if it is impossible for investors (particularly wealthy ones) to buy tax-exempt securities, private investment will be encouraged and business helped. During past few years, about 3 billion dollars has been placed annually in government securities, whereas only comparatively small amount has been placed in private securities.

SLANT: Even government employees should support this constructive proposal. All who vote should be made tax conscious.

■ Congress Gets New Farm Bill

INTRODUCED into both houses of Congress is new "cost-of-production" farm bill, whose sponsors, with two exceptions, are members of Congress from wheat and corn belts. Bill provides, briefly, that all farm products having value of more than \$10,000,000 yearly, and entering interstate commerce, be sold only through licensed dealers and handlers, at prices fixed by Secretary of Agriculture after holding public hearings. Price would presumably be based on average cost of production.

One estimate on how many crops would be affected is that about 75 out of 200 farm products would come under bill. Surplus from each crop would be sold abroad for whatever it would bring. New bill would throw overboard crop control.

"Most radical farm bill yet proposed" is how some view new bill, because it calls for arbitrary price fixing on such a large number of farm products, regardless of their supply. It is pointed out that in event of bountiful year for any one product, it would be diffi-

cult to keep price up to mark fixed by Secretary of Agriculture; and also that it would be practically impossible for anyone to fix a proper price for many farm products.

Present Agricultural Adjustment Act, passed last year, provides for limiting acreage to be planted to cotton, wheat, corn, tobacco, and rice in any year, when approved by two-thirds of growers of any of these crops. Farmers who cooperate in AAA program are eligible for government crop loans. Yearly cost of present farm program is put at about 1 billion dollars, counting probable loss from loans on farm products.

New bill proposes to continue soil conservation program, adjustments in freight rates on farm commodities, development of new uses and new markets for farm products, the Federal Surplus Commodities corporation, loans on agricultural commodities and refunds to Department of Agriculture of 30 per cent of duties collected on imported farm products.

SLANT: Here is another costly and dangerous agricultural experiment. Price fixing by government is uneconomic. If government fixers would only give agriculture and business a chance to recover, there soon would be better times.

■ Senate Votes Relief Cut

BY VOTE of 47 to 46, Senate approved, on January 28, the sum of \$725,000,000, voted by House to run WPA from now until June 30. President asked for \$875,000,000. Only changes in House report made by Senate were to limit WPA dismissals before April 1 to 5% of present number on rolls, and to provide for another call for funds by President before June 30, if private jobs do not take up the slack.

Actively opposed to cut was President, relief workers, labor organizations, WPA officials and New York's Mayor LaGuardia as representative of the U. S. Conference of Mayors. They argued that more than a million workers would have to be dropped from WPA rolls by June if the full \$875,000,000 were not appropriated, and that this would cause suffering among the needy.

Those who favored the cut to \$725,000,000 point out that this sum is only 8% less than average sum available during same months last year and that furthermore, private industry is now employing 1,500,000 more workers than it did four months ago. WPA, on the other hand, has reduced its employment of relief workers by only 200,000. Experts estimate that private industry will employ another 1,250,000 workers during next five months.

Victory for economy vote was due to coalition of Democrats and Republicans and it is being taken to mean that the 76th Congress intends to use its own judgment in this session.

■ Secretary Morgenthau Against Processing Tax

SECRETARY of Treasury Morgenthau turned thumbs down on more processing taxes as means of raising money to pay farm benefits. Mr. Morgenthau, in recent press conference,

said that in his opinion taxes on consumers are high enough. **SLANT:** Supreme Court declared processing taxes under old AAA unconstitutional. This publication has opposed them on grounds that they robbed Peter to pay Paul. Northeast farmers, who received comparatively small share of farm benefits, were forced by processing taxes to pay more for their supplies, and tax was in turn used by government to pay off middlewestern and southern farmers.

Secretary of Agriculture Wallace, in his annual report, came out for new processing taxes, and said that they were the "one important thing missing from our present farm program."

■ Better Business Believed Sure This Year

IN SPITE of war scares and decline in stock market, economists believe that present downward trend is temporary and insist that, barring actual war, 1939 will be a year of better business. They point to following signs:

Home building permits are much higher than year ago, and this means jobs for workers and orders for factories.

Power industry will probably be forced to expand because electric power production capacity is now taxed to limit in number of regions.

More jobs and brighter prospects are making more people turn in their old cars for new ones.

Government large-scale spending for relief and public works is helping the pot to boil.

National defense plans foretell another big field for government spending, breeding temporarily more jobs and orders.

Machine tool industry orders showed sharp advance in December, highest in a decade with one exception.

Worst drag on recovery, economists admit, are low commodity prices, which make agriculture and other raw material producing industries lag in their recovery.

■ Uncle Sam is Biggest Landlord

ABOUT one-fifth of total area of United States is Federal owned, according to inventory of Federal real estate made public last month by President Roosevelt. This does not include property owned by various emergency agencies through default of mortgage payments.

Great bulk of Uncle Sam's real estate is rural—forests, grazing land, and national parks, with only some 47,444 acres in urban property (not counting District of Columbia). Most of all of this property is in Far West, where in some cases one-half or more of a State is owned by U. S. Government. Nevada belongs 83 per cent to U. S.; Arizona, more than 63 per cent; Utah, more than 60 per cent; Idaho, more than 58 per cent; Oregon, better than 46 per cent.

Northeastern states are at other end of scale. For instance, Uncle Sam owns only fraction of 1 per cent of land in Rhode Island, Connecticut and Massachusetts. Going on right now

is battle between Federal Government and State of Vermont over question of land ownership. War department had plans for dam across Ompompanoosuc River at Union Village, and proposed to acquire the land for it under National Flood Control Act passed last year. This permits War Department to acquire lands for flood control without State consent or payment to localities for loss of tax revenues.

Governor Aiken of Vermont insisted on written contract, whereby Vermont formally transferred land to nation. Secretary of War Woodring refused to sign contract, said it was unnecessary, implication being that government could take the land without permission. Since then Vermont has seen red.

State petition was signed asking Congress to request Secretary Woodring to sign proposed contract, and it also asked Congress to modify Federal Flood Control Act so as to prevent Federal condemnation of lands. Five other New England Governors are now backing up Vermont's Governor. Fight is based on doctrine of States' rights, which provides that Federal Government powers are those only which are given it by the Constitution.

■ Grange Urges Cut in Farm Aid Maximum

LIMIT TOTAL annual farm benefit payments to any individual farmer or corporation to \$5,000 (instead of present limit of \$10,000) is recommendation of Executive Committee of National Grange to Congress. "Our goal should be preservation and prosperity of the family-sized farm," the Grange committee said. "Corporation and chain farming should not be encouraged by the government."

Committee also asked that present farm act be amended and simplified; also, more research on new uses for farm products, "honest branding" of foods and fibers, continuance of marketing agreements, low interest rate on farm loans, and a long-range policy of land utilization.

Announced by Committee were place and date of Grange's next national convention—Peoria, Illinois, Nov. 15-23.

■ National Defense Takes Form

MAIN item in President Roosevelt's special defense message to Congress during fortnight was proposal to add 3,000 planes to our Army aviation forces, which would bring United States combined Army and Navy air force to 8,500 planes and make this country second only to Germany in air strength.

Intention, said President in his message, is not to build world's biggest air force, but rather to build one which will be big enough to do a definite defense job in case of war—protect American territory, play watchman for Navy, guard Panama Canal so that our warships could pass through safely, and protect various U. S. naval bases.

Appropriation of 552 million dollars to be spent over period of three years was recommended. This is an "emergency" addition to country's normal defense appropriation.

President's recommendations for speeding up U. S. air defense are said to be in line with secret report of foreign air strength to government by Colonel Charles Lindbergh. Also, American ambassadors Kennedy and Bullitt (to Britain and Germany respectively) testified to a closed meeting of Senate and House Military Affairs Committees recently that war appears inevitable in Europe.

SLANT: Overwhelming importance of adequate air defenses was demon-

strated in Europe last fall, when Hitler succeeded in backing down England and France as result of Germany's greatly superior air strength. Comparative figures for five leading nations are: France, 4000 planes; United States, 4300; England, 5000; Italy, 7000; Germany, 10,000.

■ Farm Congressmen Now in Minority

IN THE old days, most Congressmen could boast that they were farm bred, but current congressional directory shows that this is no longer true. Out of 457 members of House of Representatives, only 136 come from farms.

Five Congressmen, according to directory, were born in log cabins; 3 on ranches, and one in a sawmill camp. Fourteen members—largest number in years—are foreign born.

■ New England Salvaging Its Timber

WHEN New England started to sweep up after last September's terrible hurricane, it was estimated that 4 billion feet of valuable timber was lost. Careful check-up since then is said to reveal that 1.6 billion feet is nearer right—big enough figure in any case.

Considerable progress in salvaging timber has been made under direction of F. A. Wilcox, chief of U. S. Forest Service. Mr. Wilcox was appointed Administrator of Northeastern Timber Salvage Administration, and last November a set-up was completed whereby Reconstruction Finance Corporation loans funds to Northeastern Administration to buy logs, logs being held as collateral for money advanced.

Last month, AAA announced that owners may earn government benefit payments of \$4 an acre for cleaning up damaged forest lands which constitute a serious fire hazard. Maximum payments for any farm will be \$60. These payments will be in addition to those offered in regular conservation program for New England area.

■ New Frontiers

OVER 80,000 square miles of country never before seen by eyes of man now waves the Red, White and Blue—thanks to Antarctic explorer Lincoln Ellsworth, leader of his fourth expedition to that icy region.

"In all this area", wirelessly Mr. Ellsworth from his plane, "not a mountain range or a speck of bare land showed. The whole area, as far south as we could see, slopes gradually upward to a surface altitude of approximately 11,500 feet, and continues on toward the pole."

Speaking of possible future value to United States of this land, Mr. Ellsworth said that, although snow covered today, the area may become snow-free in years hence and disclose rich mineral deposits, for exposed surface on the coast showed much evidence of high mineralization.

■ Fateful Days for Spain

AS WE go to press, Spanish Rebel forces have captured Barcelona, Spanish Loyalist capital. Previously, city was placed under army rule and all civilians not engaged in war activities were advised to leave. Americans were given chance to escape aboard U. S. cruiser Omaha, which had been standing by at Villefranche, France, only 12 hours away and steamed to rescue of Americans as soon as it was seen that city was doomed.

Barcelona's ports and surrounding

district, according to one war correspondent, are like an inferno, for city has been subjected to constant bombing.

Loyalists fought desperately to defend the city, but were short of food, munitions, artillery and airplanes, and unable to secure supplies from outside. Rebels, on other hand, are reported to be well supplied with men and munitions from Germany and Italy.

Although it is predicted that Rebels will be in full possession of this part of Spain within a few weeks, end of war is not expected at once. Loyalists are still in possession of central and southeastern Spain and it is believed that they will fight to the last ditch.

■ Dustbowl Getting Small

SHRINKING is Dust Bowl—not because of some great geological change, but because 13,752,118 acres of it are now protected by cover crops, according to report of regional advisory committee of land use of Southern Great Plains area. Committee states that only about 2½ million acres in Dust Bowl need fear possible damage by wind erosion this year.

We Bought a Farm

(Continued from Page 1)

it is like the man that did his chores so late he had to skip a milking to get back on time.

The time has come when we all must do more business and do it quicker and more efficiently than in the past. Horses are too slow now to do the heavy work on a farm if the farm is large enough to support a tractor. Not all farms are suitable for tractors. If a farm is wet or hilly, it is not a good policy to invest too much in a tractor. Too much time is spent in crawling up a hill side or through wet places.

After having some experience in the farm game, I would not advise a young man to buy a small farm. It costs just about the same to keep your family on a small farm as it does on a larger one. The small farm requires almost as many farming tools and equipment as a large one, with half the income.

Everything is being done these days with more speed and less manual labor. My son plowed twenty-five acres of stubble ground with our large tractor and three bottom plow in eighteen hours. How long would it have taken a team with a walking plow to do the same job? This goes to show how manual labor can be cut down. Our small tractor will cultivate as much as three teams. I find, with four or five men working on the same farm, that it does not pay to work all in a bunch more than is necessary. Too much time is lost. If men are working one or two in a place and on different jobs, more work will be accomplished.

Another very important item is feeding the soil. Don't be afraid to use plenty of stable manure and a liberal amount of commercial fertilizers; also lime. I think that potatoes and cabbage respond to a good application of fertilizer as much as any crop we grow. We put about six hundred pounds of 8-16-14 fertilizer to the acre in the row for potatoes and cabbage. I think that two or three hundred pounds more per acre would be a good investment.

By using a crop rotation I have found that I can keep my soil in good condition and get good yields. I prefer growing corn the first year, potatoes and cabbage the second, beans the third, and the fourth year oats with seed mixture. After growing hay for two years I start all over again with corn.

We plan to fill our five silos, holding seven hundred tons of ensilage, from the forty acres planted to corn. We

Good Books to Read

THE NUTMEG TREE' Margery Sharp. You may not approve of Julia, kindhearted, incautious and impulsive, but I think you are going to rather enjoy her just the same. Julia's daughter Susan has grown up to be a prig, but a very lovely prig, and an attempt to save her from an unsuitable match involves Julia herself in a series of escapades. If you feel in the mood for some light, sophisticated, amusing fiction, then get a copy of "The Nutmeg Tree."—Little, Brown & Co., Boston. \$2.50.

Good Movies to See

JESSE JAMES. Rousing entertainment, in technicolor, featuring Tyrone Power, Henry Fonda, Nancy Kelly and Randolph Scott.

EVERYBODY'S BABY. The Jones family brings its trials and tribulations to the screen in a rollicking comedy which centers around Bonnie, the oldest daughter, and her baby girl. The young wife insists upon following the scientific methods of baby rearing, which results in a verbal and actual battle between the old-fashioned Jones and the doctor and his staff, until Grandma takes the matter in hand.

HORSES

HEAVY AND HANDY-WEIGHT FARM WORK HORSES: high-grade Belgians and Percherons at lowest country prices. FRED CHANDLER, Chariton, Iowa.

From SKEFF'S NOTEBOOK

By L. B. SKEFFINGTON

A YEAR or two ago Wayne County poultrymen, working through their Farm Bureau poultry committee, set up a county "label" for marketing their eggs. They are shipped to the G.L.F. auction in New York. The other day I went with a group of upstate farmers to the auction and heard the manager tell them the label was bringing a premium of two to four cents.

Wayne County is not the only county with a similar proposition, but I have been more in contact with that project. At the auction were eggs bearing Cayuga and Onondaga county labels and these, too, are bringing premium prices. The answer, of course, is that the labels are acquiring a reputation as the mark of nearby fresh eggs of superior quality.

See Big City Markets

The 84 persons who made the trip to New York quite naturally have a better idea of how their produce and the produce of their competitors is handled in the metropolitan market. A visit at 4 a. m. to the piers where fruits and vegetables from the West and South were on display started the inspection tour. At the fruit auction they saw citrus fruits being sold in enormous volume by rapid-fire bidding.

Those who use the auctions claim it is the best way of selling produce because it brings the best price in a competitive market and provides a means of handling large volumes. Most of the western apples are sold over the auctions and New York growers wanted to know why their fruit was not handled in a similar way. They were told the main obstacle was lack of a large volume of uniform pack.

See Government Buying

Another demonstration of rapid-fire trading was seen on the Mercantile Exchange, dealing in butter and eggs. Eggs were being traded at 19 1/4 cents and great amounts of butter changed hands at 26 1/4 cents. One of the names that appeared on the board most frequently was "Kelly", and it was explained that Mr. Kelley was buying butter for the Federal Surplus Commodities Corporation. The morning the visitors were at the exchange he bought 3,100 tubs to add to the government's holdings of 85 million pounds.

In talking with exchange members we found they expected the government would step in and start buying eggs if prices dropped much more. They agreed government buying had put a floor under butter prices, and that butter and egg prices were too low. I tried to obtain their views as to what should be done about it. One opinion I found was that the great supply of butter is due to so much improved pasturage under the farm program. Members thought something ought to be done to increase consumption.

The seriousness of the situation may be gathered from the fact that butter in storage totals more than three times the 42 million pounds on hand a year ago. I found no criticism, but rather praise, for government purchasing, and also a fear that the solution of the problem goes much further than that. "Good business recovery and increased purchasing power is what is needed," one man remarked and several nodded agreement.

Pushcarts and Peddlers

A visit to the pushcart market always is interesting as showing a part of city life most farmers find hard to appreciate without seeing. Here one finds price the dominating factor, as consumers buy in cents rather than dollars. The pushcarts do not take the

best quality stuff, but the produce they can buy cheapest. There is no doubt that peddlers form a large outlet for farm produce at some price. Just now the New York City administration is trying to restrict peddlers. I don't claim to know all the merits of the situation, but it appears the pushcarts perform a useful service to low-income consumers.

Some idea of New York's enormous appetite for fruits and vegetables was gained at the Washington Street market. Mixed in with produce from other sections was considerable from the home areas of the visitors. Here again they were told by the wholesalers that they can do better with produce shipped by growers or packers with good reputation for quality of pack.

At the Bronx market, Harold Simonson, Long Island grower and Master Farmer, took the party in hand and explained operations of what is expected to become the metropolis' largest food terminal. New railroad tracks are being laid and sheds erected so that by spring the market will be able to receive cars on track from any section. The new Triborough bridge gives Long Island quick access to the farmers' market. A number of receivers interviewed gave their opinions that the Bronx terminal was due for great expansion in volume.

The Governor is Right

Before going down to New York I took in the meeting of the New York State Agricultural Society in Albany. Governor Lehman told the annual dinner that "the crowning advantage of New York State's agriculture is the proximity to the world's largest market, New York City." (See page 2 for story).

Century Farmers Cited

At the Agricultural Society's meeting a long list of speakers representing state farm organizations and allied in-

DOREEN ROOD of Canton, St. Lawrence County, and Lewis Worden of Windsor, Broome County, N. Y., who at the recent annual meeting of the New York State Holstein-Friesian Association were honored as New York State's outstanding Holstein 4-H Club members.

At the meeting, Carl Wooster, President, reported the largest membership in the history of the Association. The officers—Carl Wooster, President; Frank Wavle, Treasurer; and W. D. Brown, Secretary—were re-elected. Secretary Brown presented 175 medals to members who had belonged to the organization for more than ten years.

terests gave their views of the outlook for agriculture. In general, they expressed belief that major gains to date are the result of co-operative action and that as co-operation is better understood it can be more useful. Herbert P. King, president of the Farm Bureau Federation, saw little hope for a rising or stable price level without currency management. Dean Carl E. Ladd emphasized the comparative advantage New York farmers enjoy by pointing out that more than half of the farms of the state are free of mortgage debt.

The society, in accordance with custom, awarded "Century Farmer" citations to farmers whose families have been on the same farm a century or more. Citations went to Ella LaGrange McBride, Slingerlands; Charles G. Lainhart, Altamont; Mr. and Mrs. Charles W. Karker, Carlisle; Arlie C. Bentley, Berlin; Mr. and Mrs. Daniel G. Wilbur, Stillwater, and Harmin L. Beagle, Valley Falls.

Syracuse Production Credit Association Has Big Year

The fifth annual stockholders meeting of the Syracuse Production Credit Association will be held on February 4th in Syracuse, according to E. M. Smith, the association Secretary.

Seven hundred twenty farmers, all of whom are stockholder-members and residents of Onondaga, Madison, Oneida and Oswego Counties, are receiving notices.

A full day's session, the meeting will convene at 10:30 in the morning in the Masonic Temple. Reports to cover the past year's activities of the credit co-operative, and resume of the past 5 seasons, will be presented by R. Y. DeWolfe of Oneida, the association's president. This co-operative has more than doubled its membership in the past 2 years and has increased its business from \$177,000 to \$606,000. The principal speakers will be H. B. Munger, President of the Production Credit Corporation and E. H. Thomson, President of the Federal Land Bank, Springfield, Mass.

Another item of business will be the election of directors to succeed H. D. Forward Sr., Camillus and John G. Pendorf of Blossvale. The meeting will be open not only to stockholder members but their guests, including several farm leaders who have been invited.

Operating as a co-operative short-term credit agency for farmers, the association makes loans chiefly to buy livestock and equipment and to grow crops. In the past five seasons its loans have amounted to \$2,190,000 with a resultant loss plus estimated losses of less than 1/25 of 1%.

The Albany Milk Meeting

ESTIMATES by several who were there put the attendance at the milk meeting in Albany on January 17 at 600. As you may recall, the purpose of the meeting was to prove to official Albany that an overwhelming majority of dairymen wanted the Rogers-Allen Law repealed or modified.

Said one man, "Judging from the applause, I assumed that about one-third of those present were in sympathy with the statements made by some of the speakers. I would judge that the balance were there out of curiosity. Considerable numbers began to go out before the meeting was over. In fact, the crowd had thinned out noticeably."

The following day the State Agricultural Society at its annual session unanimously passed a resolution urging the Legislature to continue the Rogers-Allen Law, thus following action taken by State Grange at its recent meeting in Jamestown.

Buffalo Milk Producers Hold Enthusiastic Meeting

ONE OF the most enthusiastic and harmonious milk marketing meetings which I have attended in many years was the annual meeting of the Niagara Frontier Bargaining Association, held at Marilla, New York (near Buffalo), on January 24.

The Metropolitan Bargaining Agency somewhat overshadows the smaller Niagara Frontier Agency, consisting of producers whose milk is sold in the city of Buffalo, but the Niagara Frontier Bargaining group is just as successful and efficient as the larger one. The history of each bargaining agency is almost identical except that the Buffalo producers, selling within the state, operate only under the Rogers-Allen law and under a marketing agreement administered by the State Department of Agriculture and Markets, while the Metropolitan group work under a joint Federal and State marketing agreement. Last summer, when the Buffalo producers found themselves facing ruinous milk prices month after month, the several cooperative producers' organizations got together and organized the Niagara Frontier Bargaining Association. The immediate result was such a substantial increase to the producers selling in the city of Buffalo that the total increase to dairymen amounted to \$750,000 during the three months since the plan was started over what dairymen were receiving previously.

You can imagine, therefore, how these dairymen of western New York feel about the gang that is trying to destroy the Rogers-Allen law, on which their bargaining agency is formed. I sat on the platform when the directors, representing seven cooperative organizations (many of whom had been competing with one another in the Buffalo markets before this order went into effect) went into action, passing resolutions and debating policies for the continuation of this splendid cooperative work which is meaning so much in better prices for dairymen. I told the meeting that the best result of the cooperation of this group, and of the producers in the Metropolitan Bargaining Agency, wasn't the increased prices, no matter how important they are, but the demonstrated ability of farmers' marketing organizations to unite and work together on a common plan. *There was not a single sour note during the entire program.*

Officers and directors for the coming year were elected as follows:

Niagara County Milk Producers Cooperative, Inc., Wilber Wagner and Arthur Gifford; Erie County Milk Producers Cooperative, Inc., Benjamin T. Chittenden; Collins Milk Producers Cooperative, Inc., Harvey Witman; Genesee Milk Producers Cooperative, Inc., Ellsworth Waite; Dairymen's League Cooperative Association, Inc., Thomas McKeary, John Drought, Henry Rathbun and A. L. Milks; New York State Guernsey Breeders Cooperative, Inc., Dr. H. E. Martin; Erie Wyoming Cooperative, Inc., Eli George.

Officers elected were: President, Benjamin T. Chittenden; Vice-President, Thomas McKeary; Treasurer, Wilber Wagner; Secretary, A. C. Pilger.

Resolutions were unanimously passed asking the State and the Legislature to continue the Rogers-Allen law; asking Congress to enact laws requiring that all dairy products imported into this country or transported in interstate commerce be produced from TB free dairy herds; asking that both Federal and State governments appropriate funds to provide adequate indemnity payments to farmers for dairy cattle condemned for mastitis and Bang's Disease; asking that Con-

gress enact legislation imposing a Federal tax of not less than 5 cents per pound on oleo manufactured from domestic ingredients and a tax of not less than 8 cents on that containing foreign ingredients, and that laws preventing fraudulent and deceptive advertising of oleomargarine be strictly enforced. Another resolution put the Niagara Frontier Milk Producers' Bargaining Agency on record as endorsing

the butter advertising campaign, and urging every dairy farmer to lend his support to this movement.

How the Milk Marketing Agreement Works

(Continued from Page 5)

and try to develop it into an even better plan. You, yourselves, are the ones who have the real stake in the plan. It is, primarily, the plan of the industry, and particularly of producers. It is your milk, from your farms, and the checks you get from it represent your living. We do not know how long you will want to work with it, and to en-

The Outlook for Milk Prices

PART I

By LELAND SPENCER.

IT IS an old saying that supply and demand determine the price of any commodity. That is true as a general statement, but it is not worth much to a farmer or to anyone else until the facts that apply to a particular product and a particular market are set down and evaluated. Furthermore, we have learned that the price of milk or any other product may be affected greatly by a rise or fall in the general level of prices.

Leland Spencer

Conditions of supply and demand for milk determine whether the price of milk will be high or low in relation to the general level of prices. Therefore, in discussing the outlook for milk prices, it is appropriate to consider first the relation of milk prices to the general trend of commodity prices over a period of time. The ups and downs in the prices that farmers received for milk in New York and in average wholesale prices of thirty basic commodities in the United States since 1914 are shown in the chart. Basic commodities include some of the staple farm products such as wheat, cotton, hides, and lard; and other raw materials such as copper, tin, rubber, and petroleum. All these products have active competitive markets and are important in international trade. Their prices are quickly affected by changes in monetary conditions in this country, as well as by changes in supply and demand throughout the world.

It is evident from this chart that the farm price of milk in New York has followed rather closely the ups and downs in average prices of basic commodities. Both hit about the same low point early in 1933. It should be noted, however, that milk prices usually do

not rise or fall as promptly as do the prices of basic commodities. In the first two or three years of the World War, there was a serious lag in the prices that farmers were paid for milk. But this loss was made up when prices dropped after the break in 1920 and again in 1930-1932. When commodity prices were suddenly jerked upward by devaluation of the dollar in 1933, milk prices did not lag as they usually do. The reason is that the Milk Control Board began fixing prices just at that time, and arbitrarily raised the price of fluid milk and cream without waiting for matters to take the usual course.

Between 1925 and 1930, milk prices were high in comparison with the average prices of basic commodities. Apparently this was the result of certain conditions that were especially favorable to milk producers at the time. Business was very active then and there was a strong demand for milk and cream. The milk supply was short, and the Health Department resisted pressure to extend the boundaries of the milk shed.

Last summer the price of milk was very low. Under the Federal and State Marketing Orders that became effective September 1, the prices of fluid milk and cream were raised one or two cents a pound. Since then the farm price of milk has been 10 to 20 per cent above the pre-war level, and a little higher than the average prices of basic commodities. During the past year, the general price trend has been downward, but there has not been much change the past few months. No one can be certain what the trend will be during 1939, but there is one good reason for expecting it to turn upward. The general level of prices is now so low that it is more likely to rise than to go lower.

If the effect of dollar devaluation were removed from present prices of basic commodities, they would be almost 40 per cent below the pre-war level—lower than at any previous time for which we have records. Eventually these prices will go much higher, and the price of milk will follow. There is a fair chance that this climb will start in 1939.

FIGURE 1. CHANGES IN PRICES RECEIVED FOR MILK BY NEW YORK FARMERS AND IN WHOLESALE SALE PRICES OF 30 BASIC COMMODITIES IN THE UNITED STATES
Whether milk prices rise or fall during the next few years depends more upon the trend of commodity prices in general than upon any other circumstances.

deavor to improve upon it. We can only pledge you that, as long as you do desire to work with this plan, all the people in the office of the Market Administrator—and we know this applies to both the State and Federal agencies as well—will give their best thought and their best energy, towards helping to make it accomplish what it was designed to do.

December Milk Prices

The Sheffield Producers announced price of \$1.985 for December 3.5 Grade B milk in the 201-210 mile zone, which price is subject to the customary differentials. The November price was \$2.05.

The Dairymen's League Cooperative Association announced a net pool price to producers of \$2.01 for 3.5 Grade B milk in the 201-210 mile zone. This price includes average differentials of 6c, but does not include Grade A premiums. The November price was \$2.07.

For December milk the uniform price, as announced by Administrator Harmon, was \$2.02.

Potatoes

Reports from 37 late and intermediate potato-growing states indicate that merchantable potatoes on hand for sale on January 1 totaled 100,806,000 bushels, which is 11 per cent less than the stocks on hand a year ago and 4 per cent less than the five-year average from 1933 to 1937 which was 105,369,000 bushels.

In 18 surplus late states, January 1 stocks were estimated at 92,845,000 bushels, compared with last year's stocks of 105,508,000 bushels.

U.S.D.A. reports probably production of early potatoes in Texas and the southern part of Florida as 1,732,000 bushels, compared with 2,145,000 a year ago.

Earlville Sale

At the 101st Earlville Holstein Sale, under the management of R. Austin Backus, in the reconditioned sales pavilion at Earlville on January 19, 124 animals passed across the block at an average price of \$135.00, or a total of \$16,700. It was the largest one-day sale in the group. Walter F. Andrews, Beach City, Ohio, and Clarence B. Smith, Lansing, Michigan, alternated in the selling, with R. Austin Backus reciting the pedigrees as only he can do.

There were 64 consignors and 74 buyers. Twenty-three young heifer calves averaged \$30 each. Two hundred automobiles were parked outside, and the 700 chairs in the pavilion were all occupied. The next sale will be on February 16.—John R. Parsons.

For Your Safety and Convenience

Twice a day you have to climb up and down your silo. The Unadilla is famous for its safe, sure tread—sure grip—door-front ladder.

"I WANT TO BE A Sheepman"

By DEWITT C. WING

A YOUNG MAN in an eastern city wrote so often of his ruling ambition that we invited him to spend a few weeks with us on the farm in the highlands that border the Catskill Mountains. "I want to be a sheepman", repeatedly wrote Jim, tall, fat, good-natured and 19. Born and reared where he lived, he had graduated from high school. "I work", he said, "in a relative's filling station and at sun-up ride an uncle's horse several times a week into the hill and valley country that surrounds us."

Neither of us on the farm knew the boy except as a frequent correspondent who plied us with questions. We doubted whether he had the making of a sheepman in a highland solitude like our own, but we agreed that as an epistolary salesman of himself he was a prodigy. Scotchmen used to pray for a good conceit of themselves. Jim didn't require to pray for conceit, and yet I never thought of him as being conceited. To me he was an earnest boy, writing from a heart hungering for life and action "over the hills and far away." We liked Jim before we saw him.

Two feet of February snow blanketed the farm. Strong winds, often speckled with flakes, accompanied by near-zero temperatures, made hay hauling and sheep feeding a little more than a brief chore every day. Jim had received our invitation. It informed him how to proceed to the farm from our village.

Toward the end of the month, the weather moderated, the snow largely disappeared, the flock went afieled to graze succulent sedge crowns. Apparently, the winter was over, but local weather prophets had warned us that March was always to be reckoned with on our mountain, and these prophets were not without honor in their own neighborhood. March came in like a lamb wagging its tail. Sunny, calm and comparatively warm weather prevailed until a few days before Easter; then a darkening fog rolled in off the Atlantic Ocean and hung upon the hills for three days, ending in a wet, steady snow that cushioned the land.

Unannounced, Jim arrived late of an afternoon. A neighbor delivered him and his trunk and saddle on a two-horse sled. Our small cabin was crowded with bagged oats and many other things, but a sheepman's home will always accommodate a guest and his knapsack. We smiled at Jim's trunk and almost laughed at a saddle that, on either of our horses, would look like a postage stamp on an elephant.

In the evening, after supper, we benched around the cookstove and talked. Heaton was then taking his turn at cooking. Jim was a thoughtful listener. Whenever he spoke, he asked a question. He had a head and there was

something in it, but we wondered about his hands and feet. We wondered whether his soft bulk contained much sand and grit.

Outdoors the weather was growing colder, while the north wind made wild music in the forest near the cabin. At 9 o'clock snow pellets were tapping on the window panes.

A roaring blizzard rocked the cabin all night. Floury snow blew in under the door and through the roof around the stovepipe, forming peaked little mountain ranges on the floor. Half of the flock was marooned around a haystack two miles from the shack. My mind was on the sheep. It was a long night.

At daylight, the view from the west and south windows was Arctic and short. The storm was still raging. Breakfast over, we got into all the extra clothes we could walk in and went forth into the blinding, biting weather to feed the sheep and horses, and get ready to "bust out" a trail down the hill to the snow-bound part of the flock. Each of us carried a long-handled shovel.

In snow knee-deep it was slow going to the barn. Our six big feet, heavy with leather and rubber, were calculatingly set down to form a path. Snow was piled head-high half around the barn. There was no opening a door without shoveling a lot of snow. Jim fell to the task, following our lead. One of the Percherons whinnied an expectant good morning when we opened the stable door and saluted him by name. Sheep in the adjacent shed began a chorus call for hay. Jim said, pleadingly, "Let me feed them". Heaton told him to go to it.

After doing the feeding, harnessing the team, and equipping the snow drag for its first use in that winter, we returned to the cabin and planned our rescue expedition to the sheep in distress. All possible haste was impera-

One cannot stress too strongly the value of politeness. Always say "excuse me" before rooting a fellow Porker away from the trough.

tive. Time was valuable, in terms of sheep. We were soon on the way. Each took a turn at driving. The driver stood on the hemlock drag, followed by two of us plodding along in its wake. When his fingers grew numb, he stepped off the drag as one of the other two stepped on and took the lines in mittened hands.

The team walked much faster than we could travel behind the drag without striking a frequent trot. It was easier to keep ourselves warm than to keep cool, for in several low places the horses sank into drifts to their hips and stopped. Unhitching, shoveling, leading the team out, and then hitching up were not altogether pleasant.

In two long, laborious hours we drew up at the haystack, half-surrounded by 75 young ewes. They had eaten into some of its foundation so far that the stack would topple over upon them before night if we didn't wire and prop it. We knew that some ewes belonging to this band were missing. A search with shovels in a drift near the stack uncovered eight head that had suffered in the silence of their species and perished. We couldn't move the sheep in a storm; all that could be done was to drag down the snow around the stack and scatter hay on the dragged area.

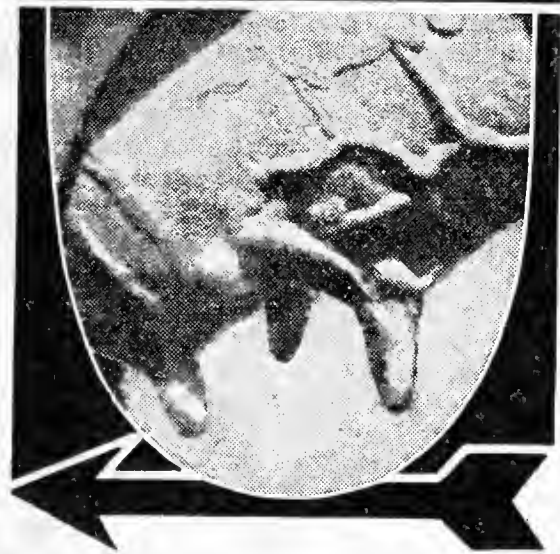

When we started homeward, we faced roaring wind with teeth in it. Our trail was completely obliterated. It was agreed that I should do the driving, all the way. Heaton and Jim elected to take it slowly in the wake of the drag. Fifty feet was the limit of my vision. The team struck a bee-line for home, bowing their heads and steaming at the nostrils as their walking developed into a slow trot. The trail of the drag was effaced almost as quickly as it was made. Taut lines to steady me didn't keep my footing intact; I was always "off or on". At the cabin I waited four hours for Jim and Heaton, and was about to set out on a hunt for them when they appeared. Jim was too tired to speak. He slumped down in a bunk and quickly fell asleep. Heaton said that soon after I left them they had lost each other, and that when he found Jim, who had been utterly lost and milling in the snow, the boy was almost completely exhausted.

Jim's spirits were fully revived the next morning. The adventure had thrilled him, and sharpened his interest in another. He was resolved to be a sheepman in the mountains. In two weeks on the farm he had a chance to learn all that we and the sheep in that time could teach him in a free and unorganized manner. Jim had more than one hard test under hard conditions. He didn't miss a chance to handle cold, hard facts. No one could have been more eager than he to learn and to work. He, himself, had never suspected that he could do and endure what he did on the farm in 14 days and like it.

Our country is a reservoir of unused or undeveloped human capacity, courage and faith. A nation's basic wealth is human resources, land and water. The spirit of adventure is the spirit of youth, whose theater of action is the land, the river, the sea and the air. Young people on farms and in towns and cities are seeking advice and experience to guide them in the fog of their perplexities. Life for them is harder and more precarious than it was for the men of my generation in the days of our youth. Forty years ago, opportunities knocked more than once at every young man's door. Everybody who wanted work could find it at or near his home. Any able-bodied healthy young farmer of ordinary intelligence and district school training, could work his way up on a farm or in a trade or profession. Steady, patient, thrifty young men and their indefatigably industrious wives paid for farms, bought

**DOUBLE
HEALING VALUE
Because it's
ANTISEPTIC**

**FIGHTS INFECTIOUS GERMS
WHILE IT HEALS**

Science has found a way to give Bag Balm definite antiseptic properties seldom found even in human ointments. Laboratory research has accomplished this important result entirely without affecting the Bag Balm texture, soothing, penetrating and non-toxic properties so well known to cow owners.

Wounds, cracks, chaps and surface injuries are choice spots for the breeding of infectious germs. Now Bag Balm fights these germs as it heals! The improved Bag Balm is a double-duty healer, correctly stiff in texture to hold in place and protect the surface under all conditions, and as a bland rub in reducing Caked Bag.

The big 10-ounce can still sells for only 60¢ at feed dealers, general stores, druggists, or by mail. Many have imitated the name and package, but only Bag Balm can deliver Bag Balm results. Generous one-oz. sample FREE. Send 4¢ stamps for packing and postage.

DAIRY ASSOCIATION CO., INC.

Just mail a letter or penny post card giving your name, address and number of cows in your herd to Sterling Research Corporation, Dairy Division, Dept. A5, Sidway Bldg., Buffalo, N. Y. We will mail you this booklet FREE.

**Barnyard
GOSSIP**

Open Sheds for Cows

AN OCCASIONAL dairyman is enthusiastic over the idea of an open shed in which dairy cows can run during winter time. Recently I saw such an arrangement on the farm of Ralph Space of Dryden, New York. Hay is fed in racks, and big barn doors can be opened on sunny days.

I saw another similar arrangement on the farm of Lee Edmond, Cohocton, New York. In one corner is a watering trough where cows can drink whenever they wish, plus arrangements for feeding.

Plenty of bedding is essential where cows run loose, and the cleaning out of the pen, while not necessary every day, is quite a chore when it is done.

* * *

Skim Milk Buttons

The general term "plastic" as used in industry means a material that can be softened by heating so that it can be molded into some definite shape and retain that shape when it is cold. From the dairyman's point of view, the most important plastic is casein from milk, used for buttons, buckles, and other similar products.

"What is most needed," says D. C. Carpenter of the Geneva, N. Y., Experiment Station, "are new developments which will speed up the process."

About three years ago in Italy, casein wool was developed. A solution of casein is forced through a fine hole and coagulated in formaldehyde solution, resulting in a fibre which can be spun and woven. It is not expected, however, that this will in the near future provide any stiff competition for the natural product, wool.

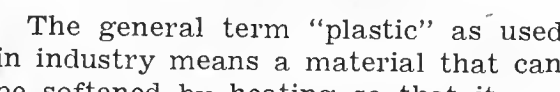

* * *

Livestock Marketing

"Twenty-five million dollars is the annual income of New York State from the sale of cattle, calves, hogs, and sheep." So says W. M. Curtis of the Cornell Department of Agricultural Economics.

Those figures are big enough to warrant more information about marketing this stock than we now have. To get this information some questions are being asked by the College through County Agents. The information, when it is assembled, will be used by farmers to adjust themselves to constant changes in livestock marketing.

**DOWN THE
Alley**

(Continued from Page 12)

tutes", don't get your hogs too heavy, meaning over 215 or 225 pounds.

* * *

How can I help being an outdoor enthusiast for all livestock, when invariably on the farms I visit, the horses that are running out look better than the ones tied in the barn? Or when the lot of lambs that had to be fed in an outside shed, or some other makeshift place, are doing better than the lambs in the big barn with all sorts of protection? Or when the ewes that are out around the orchard with just any old kind of shelter are better than the neighbor's who have everything in the way of protection?

Sometimes I wonder if the influence of the warm dairy barn hasn't influenced the livestock man to the detriment and comfort of normally outdoor animals to say nothing of the owner's pocketbook. Our horses and sheep are still out, and while the sheep have been fed, the horses have not, and even with this snow they have not come to the barn. Just think what this has saved in harvesting costs and labor costs, particularly since they all look better than they did in the fall, and I know they are happier. It would be cruel for you to turn them out now, after protection; but another year, start it early in the fall.

The reason I am particularly stressing outdoor livestock, with the animals themselves doing most of the harvesting, is because it has been definitely proved that the cost of raising or feeding livestock in the Northeast can be greatly reduced, and the next "farm program" is going to be produce in abundance when you can produce cheaply, or cheaper than the other fellow.

* * *

Don't forget that Wednesday, February 15, all the livestock men and women of New York State will be in Ithaca, for that is Livestock Day at the State College of Agriculture's Farm and Home Week, and just don't miss the American Agriculturist Master Farmer dinner, Thursday evening, Feb. 16, or you will miss the inspiration of the year.

"I Want to Be a Sheepman"

(Continued from opposite page)

more land, built big barns, marked the boundaries of their possessions with prideful fences and lived in fair to good houses.

Any young person who knows how to do something useful with his hands and acquires skill in doing it well on a farm, will always have work to do and a place to live. Thousands of

school-trained young people are not at present capable of making a living with their hands. America owes and is beginning to give its young people a fair chance productively to employ their talents. Many of them could learn how to make themselves useful and eventually self-supporting on land if they had a fair chance. Bad land, however, is no place for these young folks or other citizens, for, as Secretary of Agriculture Henry A. Wallace has remarked, "human beings are ruining land and bad land is ruining human beings, especially children". For use in primary grades, we need school books on these and related subjects. It is high time that higher education should begin lower down and keep its roots in the land.

(Continued from Page 12)

Penn. State Wins College Poultry Judging

Alfred Bieber, eastern division general superintendent of the *Great Atlantic & Pacific Tea Company*, presenting the championship cup to the poultry judging team from Pennsylvania State College at the 21st annual Eastern Contest held in New York City recently. From left to right the members of the team are: Vernon Norris, Ralph Britt, Allen Carrington, and Walter Lutz.

The Cornell team, composed of A. J. Chamberlain, Hinsdale; J. S. Hall, Groton; F. H. Kratzer, Baldwinville; and R. H. Ferrand, Gardenville, took third place.

At the dinner following the contest, Howard Pierce, national poultry buyer of the *Great Atlantic & Pacific Tea Company*, said: "Food retailers and producers have learned that their problems are mutual ones."

The Dairy Association, Co., Inc., Dept. 12, Lyndonville, Vt., will be glad to send you a 32-page illustrated booklet written by a veterinary authority and containing chapters on common cow ailments with information on how to treat them.

Now is planning time for next spring's garden. You will find in this issue seed and nursery houses who offer free catalogs if you will drop them a post card.

The Association of American Railroads, Washington, D. C., has worked out a program proposing a common sense treatment of the railroad problem. They will be glad to send you a copy.

"Profitable Dairy Management" is the title of a free booklet which will be sent to you on request by the *Beacon Milling Co.*, Dept. A, Cayuga, N. Y.

The farm seed catalog of *Edward F. Dibble*, Honeoye Falls, N. Y., is called "The Seed Buyer's Guide." It is more than a catalog, with much useful information. A post card will bring it to you.

The National Association of Food Chains expresses satisfaction concerning the recognition of the U. S. Department of Agriculture of the part which Chains have played in moving food produce and reducing prices. The Department of Agriculture states that three nation-wide Chain Store systems put on a drive to increase grapefruit consumption in the year of 1937 which more than doubled sales over the previous year. In the sum-

mer of 1936 the Chain Store group sponsored a beef consumption campaign with good results. In the fall of 1937, egg consumption was pushed by Chains.

"Farm Mechanics in the School" is the title of a new book published by the *South Bend Lathe Works*, South Bend, Indiana, and available free of charge to readers of this magazine.

The new book contains much practical information on the instruction of farm mechanics in the school. It shows methods for organizing a farm mechanics shop; suggests classification of projects; tells how to plan a farm mechanics shop; lists a number of floor plans and layouts for various sizes and types of farm shops; recommends types of equipment for use in the shop; outlines practical shop courses for students; gives equipment costs; lists projects; and is well filled with illustrations showing representative farm mechanics shops and various types of work being handled in them.

Write to the Technical Service Department, *South Bend Lathe Works*, for your copy of this new book, mentioning this magazine.

"Produlac" is the trade name of a new semi-solid distillers grain mash. Ask your dealer for a book describing it, or write to Dept. 15, Produlac Division, *National Distillers Products Corp.*, 120 Broadway, New York City.

In this issue you will find our semi-annual post card insert. Many readers find these post cards a simple and convenient way of sending for information.

A model D-2 six-cylinder *International Motor* truck, equipped with a pick-up body, and used by *Fordon's Fruit Farms*, Geneva, N. Y.

NEARBY MARKETS for NEARBY POULTRYMEN

Broilers

By J. C. HUTTAR

ONE HUNDRED and six large hatcheries reported to the United States Department of Agriculture that they had hatched 2,092,000 baby chicks in December and that the advance orders on their books on New Year's Day were 5,925,000 chicks. These same 106 hatcheries produced 1,337,000 chicks

in December 1937 and had orders on January 1, 1938, for 4,378,000 chicks. So the increase in December hatch was 56 per cent and there were 35 per cent more chicks ordered on the first of this year, according to the Hatchery Report of the Bureau of Agricultural Economics of the U. S. D. A.

J. C. Huttar

The mere fact that two-thirds of the chicks men-

tioned above represent the figures for hatcheries in New England and the Middle Atlantic States seems to show that a good part of them are intended for broiler production.

It may be a little late for the man who raises winter broilers, but a candid look at a few facts should be of some help to the poultryman who fig-

is your biggest cost in raising broilers. So I asked my friend, Al Van Wagenen, if he didn't have some five-year average figures on feed costs on a good broiler feed at the farm. Al has about everything in the line of figures pertaining to the poultry business.

On the chart, if you follow the broken line, you'll see that the cost of 100 pounds has varied from \$2.27 to \$2.50 during the year. These figures represent the average price for the years 1933 to 1937 inclusive.

Feed prices seem to go almost opposite from broiler prices, don't they?

The broiler prices used, by the way, are for "Reds", which would be about half-way between Rocks or Cross-breeds on the high side and Leghorns on the low side. Prices used are New York City top wholesale quotations less 3 cents per pound. That would be pretty close to the farm price in the Northeast. These figures are also five-year averages, 1933 to 1937 inclusive.

Now, you've got to figure that it takes 3 to 3½ pounds of feed to produce one pound of broiler meat. So these figures may be some help to you.

Other costs in broiler raising are brooding, cost of chicks, and mortality.

From what people who have raised lots of broilers tell me, mortality is the thing to watch. It may be one of your biggest costs. They say cheap chicks don't pay as they run up your mortality. That, of course, is a general

WEEKLY BROILER PRICES AND FEED COSTS PER HUNDRED compiled by Dr. A. Van Wagenen, Department of Agricultural Economics, at Cornell. Broiler quotations taken from "The Producers' Price Current."

ures on starting his broiler business in the near future. I'm not so worried about those who have their broiler chicks already started, as they have a fairly good chance of coming out all right. I'm not so sure about broilers from now on, however. Well, anyway, let's get down to the dope and then you who are thinking of raising broilers for profit can decide what to do.

This matter of telling people what to do is getting more and more out of my line as experience teaches me that no one man has all the brains. In fact, my wife is trying to convince me that I have less than my share.

In the chart above you see how broiler prices move through the year. You see that they go up throughout the first three months in the year and drop off fast after Easter until the middle of the summer. Then there is a short "up" in prices until the middle part of September. From then on broilers are going to market from smaller flocks all over the country. Also culling of layers is at its peak, increasing the total supply of poultry. And from the middle of November on, the demand is for roasters and other heavy birds.

So far as the consumer is concerned, the broiler seems to fit in his summer diet better than his winter.

After Christmas, however, broiler prices start up again.

Now, you've got to figure that feed

statement and doesn't apply in every case.

1939

Now, let's get this all together. This is the way it looks to me.

1. Start broilers immediately, if at all.
2. Get chicks that have made a health and livability record in past years (i. e., the parent stock and the hatchery).
3. Use good feeds to get maximum growth.
4. Crossbreeds and Barred Rocks bring the best prices in most big cities.
5. This doesn't look like a good broiler year because so many are being produced.

How does it look to you?

BE SURE TO READ THE BABY CHICK ADS ON PAGES 24 AND 25 OF THIS ISSUE.

Air for Hens ---but No Drafts

By L. E. WEAVER

THE DESIRED end in ventilating a poultry house is to provide fresh air without lowering the temperature too greatly and without causing drafts on the hens. Well ventilated houses are dry houses.

Open front Type 1 (Figure 1) is not satisfactory in cold weather. Cold air blows across the floor and moist air collects in a pocket at the top of the house, causing frosty ceilings. The house becomes very damp during warm

spells. The opening in the front is not covered with a cloth curtain.

Alterations needed are: an opening cut between the rafters as in Type 2, then boxing in as shown in Type 3, and the addition of cloth curtains as in Type 3.

Open front, Type 2, (Figure 2) differs from open front Type 1 in that the opening is covered with a cloth curtain

and there are openings at the top between the rafters. This is not satisfactory in cold weather. When the wind hits the back or sides of the house, it works as shown; but with the wind from the front, the incoming air blows across the floors. Also the wind blows in at the top openings and strikes the birds on the roosts.

Alterations needed are: rafter projections boxed in as shown in Type 3, cloth curtain set out 1".

Open front, Type 3 (Figure 3) is satisfactory in cold weather. Incoming air is directed toward the ceiling and does not blow across the floor. Air is sucked out of the house at the top regardless of the direction of the wind. Slides, which allow the cloth curtain to be shoved up or down, are set out from the building 1" to allow an opening at the bottom for incoming air. The cloth curtain is opened by shoving down in warm weather and on pleasant winter days. It is entirely closed on very cold days or stormy days. It is never left partly open.

The house illustrated in Figure 4, without the ventilator shown by dotted lines, is not satisfactory for the same reasons as are given for open front, Type 1. Alterations needed are: an air outlet flue or chimney as shown by dotted lines, air intakes under the windows as described in Cornell Bulletin 315, The Ventilation of Poultry Laying Houses by F. L. Fairbanks and A. M. Goodman.

Partners

(Continued from Page 2)

discharging this first responsibility as a partner of the state."

Second, Governor Lehman discussed the necessity for the use to the fullest extent by agriculture of the services that state provides for the production and distribution of farm products. Said he:

"To the great material and physical advantages which our farmers enjoy in a soil that is rich and productive, in a climate that escapes the extremes of heat and cold, are to be added the services which the state performs to enable them to realize upon these opportunities.

"The crowning advantage is proximity to the world's greatest market. With all these benefits, it seems a reasonable conclusion that the products of New York State farms should, without question, enjoy supremacy in every market throughout the state.

"Finally", said he, "I see resting upon the agriculture of our state the obligation to maintain and protect those fundamental American rights of freedom of speech, freedom of worship and freedom of the press which won their recognition in rural America.

"There can never be, either in the routine of our normal lives or the stress of conflict, any justification or excuse for compromise with the sacred right of every American to the protection of law and public respect whatever be his race or creed.

"The people of the state have charged me with the administration of their affairs for the next four years. I recognize the obligation resting upon the state in its partnership with agriculture. So far as it lies within my power, the state will continue to discharge honorably, willingly and fully its responsibility in this relationship."

Be sure to read the BABY CHICK Ads on Pages 24 and 25.

LETTERS

Georges Mills, N. H.
January 5, 1939.

Dear Sir:

Today your agent delivered to me a check for \$67.14 which pays for the time I was laid up with a broken leg as a result of the automobile accident.

I am very pleased with this settlement and I recommend the North American Accident Insurance Company very highly.

I will never be without this protection.

HARRISON PUTNEY.

* * *

Avon, New York,
Jan. 10, 1939.

Dear Sir:

I received your draft for \$14.28 to cover loss of time in my recent accident. I am very grateful.

I think your insurance protection rendered the readers of *American Agriculturist* is all that it represents and it is fair in every way just as you claim it to be; and I think every reader of this paper would be very wise to have a policy as we never know when we will meet with an accident.

AL WHALEN.

* * *

Alfred, Maine,
January 2, 1939.

George L. Brown, Agent,
Oakland, Maine.

Dear Mr. Brown:

Thank you very much for the North American Insurance check of \$20.00 you sent me. It was a great help and I appreciate your being so prompt.

I think every one should carry a North American Policy, it costs so little and is so reliable.

Your truly,
M. ALICE ELWELL.

* * *

Randolph, New York.
December 29, 1938.

Gentlemen:

I am acknowledging receipt of your draft for \$84.28 in payment of my accident claim.

Please accept my thanks for your prompt action in handling this claim and let me assure you of my appreciation of this check and I would like you to know that I think this is the best insurance that one can have for the amount of money invested and that I shall continue to be a policyholder in your company.

You may have my permission to publish this letter.

Thanking you again, I am
Sincerely yours,
ARTHUR CASE.

"WELL BRED FROM WELL BREEDERS"

GOOD NEWS FOR BATTERY BROILER RAISERS

The number of battery broiler producers has grown to considerable proportions in the North-east, particularly in New England, New York, and New Jersey. Most of these plants are raising a white broiler.

Such plants have heretofore been at somewhat of a disadvantage, not having been able to procure the right kind of white crossbreds in quantity.

The advantages of good Crossbreds are well recognized for broiler production. Our Hallcross chicks were developed for the particular needs of broiler-men; in fact our Barred Hallcross were first advertised in 1931 as "Hallcross Broiler Chicks."

The advantages of heterosis—that extra vigor gained by crossing two different breeds—are

1. More rapid Growth
2. Better Growth on Less Feed
3. Reduced Mortality

These have been amply proven on many—perhaps most—of the big plants raising broilers with barred feathers.

YOU SHOULD KNOW

we are equipped to furnish a substantial volume of our two Crosses developed especially for those who want a white broiler.

LIGHT WHITE HALLCROSS For quick growth squab and light-weight broilers.
HEAVY WHITE HALLCROSS For broilers of 2 pounds and up

Any raiser of white-feathered broilers, we believe, will find these White Hallcross an improvement on anything he has heretofore grown: because of their quicker growth—more economical gains—less mortality.

Remember please, all Crossbred chicks are not HALLCROSS, and cannot be expected to perform like HALLCROSS. The excellence of HALLCROSS chicks is due to the excellence of both parents. Our ideals, facilities, and supervision assure the superiority of HALLCROSS chicks.

Much good information will be found in our Service Leaflet, entitled, "Successful Battery Brooding." You may have a copy free, upon request. Please ask for Service Leaflet No. 7.

For those raising white-feathered broilers, we urge a trial order for Light White Hallcross or Heavy White Hallcross chicks.

Quality chicks since 1911. "Never a week without a hatch" since 1927. Pullorum free by State test since 1928. Each year we sell more chicks than ever before. We ship prepaid and guarantee 100% live delivery. Catalog and Price List free. Tel. Wallingford 645-5.

Getting Rid of

Spots AND Stains

by
MRS. GRACE WATKINS HUCKETT

Very difficult lipstick stains on napkins, etc., may be removed by 1 part glycerine, 1 part glacial acetic acid and 3 parts wood alcohol, a formula used by professional cleaners and laundrymen.

THE FOUR fundamentals of removing spots or stains are: (1) know your stain if possible, (2) know your material, (3) remove stains while fresh, and (4) have a kit of stain-removing materials.

It takes good judgment to know when to attempt to remove a stain and when to send it to the professional cleaner. Once the fabric has been weakened or color actually removed, even the professional cleaner cannot repair that damage. Certain materials dissolve dyestuffs or even the fiber itself. It is therefore necessary to know whether the material is cotton, linen, silk, wool, rayon or acetate.

If you are not certain as to material or as to stain, you should test the remover on an inconspicuous part such as the inside of a hem or belt.

The stains which any housekeeper has to remove most often are FOOD STAINS ON TABLE LINEN. Brush or scrape off as much of the spilled food as possible and use the simplest method first to get rid of the stain. Sponging with clear cool water often loosens the stain and almost never does any harm. Do not make the mistake of pressing with a hot iron until you are absolutely certain the place is clean, for heat sets many stains beyond the hope of removal.

GREASY SPOTS may be loosened by using an absorbent or solvent for the grease. Fuller's earth, talcum powder, cornstarch and cornmeal will absorb fat; an otherwise spotless tablecloth may be used again by the simple device of sprinkling on one of these and letting it absorb the grease, then brushing it away. Put on a second application if necessary.

A greasy spot between the shoulders of a dress may be absorbed in the same way—sprinkling the absorbent on the underneath side of the material. Carbon tetrachloride dissolves grease and is non-inflammable. Gasoline and naphtha also dissolve grease, but should be used only in the open, not in

an enclosed room, and certainly never near an open flame.

If the grease is mixed with egg, as in mayonnaise, dissolving the grease first and then wiping off the egg with a cool, damp cloth may be sufficient. Egg contains albumen and heat sets albumen; that is why warm and not hot water should be used until the egg is removed. French dressing which contains no egg requires only dissolving or absorbing the grease, which can be followed by sponging or laundering. If the cloth is to be laundered anyway, soaking in clear water followed by laundering is the process to follow for cream, milk and ice cream. If any stain remains, bleach with Javelle water, dropping on with a medicine dropper and rinsing out immediately with plenty of cool water.

CREAM ON MOHAIR UPHOLSTERY yields to a mixture of 1 part glycerine, 9 parts water and $\frac{1}{2}$ part aqua ammonia applied to the stain with a soft brush. Keep the spot moist by renewing the application occasionally, leaving it on for about 12 hours. Then press lightly with a not too hot iron and rub up with a clean brush or cloth.

Simple COFFEE OR TEA STAINS may be removed by washing in clear, warm water, no soap. If they are mixed with cream or milk, get it out first, then if the tea or coffee stain remains, stretch the cloth over a bowl, snap a rubber band around it to hold it, stand on a low box to prevent splattering yourself and pour boiling water from a tea-kettle on the stain. The force as well as the heat helps to remove the stain. The same method applies to GRAPEJUICE AND BERRY STAINS.

PEACH, PLUM or PEAR STAINS have a large amount of tannin which turns to a rusty brown when a hot iron strikes it. Therefore, soaking these spots in warm glycerine, which dissolves the tannin, is recommended. Warm the glycerine by setting the

container in warm water—not over the fire. Tannin is impossible to remove if the stain is once set.

Alcohol would remove the stain, but it is inflammable. Leave the material in the glycerine for some time, rinse it out, and if the stain is still there, try again. Glycerine is particularly valuable if the linen is colored. A bleach would remove the stain, but it would remove the color also. Follow the stain removal by thorough laundering.

CHOCOLATE OR COCOA DRINKS or ice creams contain albumen and fat. Therefore carbon tetrachloride should be used to remove the fat, cool water to remove the albumen, followed by sponging with generous soapsuds and then laundering.

LIPSTICK is a big problem on table napkins and towels. Since one rarely knows exactly what any lipstick contains, she is safe in experimenting with glycerine. Soak the spot in it even for hours, if material is not colored. Then try washing. Other methods are to launder in hot suds and if a stain remains, bleach it with hydrogen peroxide or Javelle water. Remember that Javelle weakens fabric if left on.

BLOOD STAINS can be removed from washable material by soaking in cold water to which one tablespoon of household ammonia has been added per gallon of water, then wash in lukewarm suds. Fresh blood stains on silk and wool may be sponged in cold or lukewarm water if water can be used on the fabric. If any traces of the blood remain after using water, sprinkle the spot with peroxide of hydrogen. Stubborn blood stains may be soaked in a salt solution, one cupful of salt to two quarts of water, followed by laundering. To remove blood from thick articles, such as blankets or mattresses, make a starch paste of raw starch and cold water and apply to the stain. Brush off as it dries and repeat if necessary.

CHEWING GUM ordinarily is removed with ease by rubbing with an ice cube held in cheesecloth. If for any reason this does not work, scrape off as much gum as possible with a dull knife, apply carbon tetrachloride, using a pad underneath. Another method is to soak the spot in kerosene or gasoline, then wash in hot suds.

GRASS OR FOLIAGE STAINS disappear when fresh usually by washing in warm soap solution, rubbing the spot between the fingers at the same time. Sometimes a yellow stain may be left and this can be bleached with Javelle water. If the material is not washable, sponge the spot with a mixture of denatured alcohol and water in equal parts, using a pad underneath. To prevent a ring, brush the alcohol irregularly into the fabric and dry quickly.

Remove GREASE OR TAR by softening with lard or kerosene, followed by laundering.

FRESH PAINT or VARNISH stains are loosened by turpentine, lard or kerosene, followed by washing. If stains are old and dry, the treatment must be repeated until the stain is loosened. Turpentine, chloroform or wood alcohol will dissolve the resinous materials in varnish, while amyl acetate (banana oil), kerosene, turpentine or lard may be used to soften the stain. Then apply carbon tetrachloride and the coloring matter should brush off. Soak the spots in equal parts of ammonia and turpentine. Follow finally by washing in suds.

Equal parts of denatured alcohol and water dissolve SHELLAC.

One has to do a little guessing if the spot is INK, for inks vary in their com- (Turn to opposite page)

Mrs. Grace Watkins Hockett

LESSON X. SALADS

A hearty luncheon or supper salad and one attractive in color is made of asparagus tips freshly cooked or canned, sliced hard cooked egg and shrimp on lettuce leaves.

SALADS are valuable in the diet for their vitamin content, for important minerals (iron, calcium and phosphorus), for their vegetable fiber which furnishes bulk and promotes proper elimination, and for their flavor and crispness which stimulate appetite.

Salads may be classed as light or heavy. Light salads properly are used with heavy meals and heavy salads with otherwise light meals. We think of the light salads as those containing any kind of greens, any kind of vegetables with a light dressing, or any small amount of tart fruit such as orange or grapefruit with greens and a light dressing. The heavy salads contain egg, cheese, meat, potatoes, sweet fruits, cheese or other foods of similar nature. French dressing, the standard light dressing is made as follows:

French Dressing

1/4 cup vinegar or lemon juice
1 teaspoon sugar
1/2 teaspoon dry mustard
1/4 tsp. paprika
1 teaspoon salt
3/4 cup salad oil

Shake up well in a jar every time used in order to mix the ingredients, which are held only in suspension rather than in an emulsion.

To vary French Dressing:

- 1—Instead of sugar, use 2 tablespoons honey.
- 2—Mix in 1/4 cup tart red jelly to use with fruit salads.
- 3—Add 1/4 cup anchovies chopped fine.
- 4—Add 1/2 cup crumbled Roquefort cheese.
- 5—To make chiffonade dressing, add chopped parsley, onion, hard cooked eggs and cooked beets to the recipe.

Greens useful for light salads are lettuce, cabbage, celery, parsley, watercress, romaine, Chinese cabbage, tender raw spinach, and curly endive. Chopped carrots, onion, sliced radish, raw turnip or even the flowerets of raw cauliflower crumbled fine may be put together to suit almost anyone's fancy. It is

not well to combine too many. Three or four are plenty. If one lacks lettuce, carrot tops, nasturtium leaves, celery curls or crisp celery may be used for garnish. Color is important as well as flavor.

General rules for salad making are:

- 1—Have all ingredients cold, clean, crisp and dry.
- 2—Ingredients—not too many nor too finely chopped.
- 3—Juicy fruits and vegetables well drained.
- 4—Consider texture and color of all foods combined, soft with crisp, tart with sweet, mild with piquant, etc.
- 5—Consider the rest of the meal: leaf salads with hearty meals, tart salad with fish, hearty salad as main dish; fruit salad may be a dessert.
- 6—Handle lightly, tossing with a fork rather than stirring with a spoon.
- 7—Serve attractively on cold dishes.

Mayonnaise can be made by beating together the egg, seasonings, (same as for French dressing), and a part of the acid; then add oil, drop by drop at first until thick, then add more oil until the dressing becomes thick; then add the rest of the acid and the rest of the oil. Usually an egg yolk takes 3/4 to 1 cup of oil and about 2 tablespoons of vinegar or lemon juice. Thorough beating

to emulsify the fat completely is essential for the dressing to stand up well. Store in a cool but not cold place.

To vary mayonnaise, either the home-made or bought varieties:

- 1—Thousand Island dressing: 1/4 cup chili sauce, 1/2 tsp. grated onion, 1 tbsp. mixed pickle, 2 tbsp. chopped stuffed olive, 1 hard cooked egg chopped fine, 1/2 cup whipped cream.
- 2—Russian Dressing: 1 part chili sauce to 2 of mayonnaise.
- 3—Tartar sauce: season mayonnaise with tarragon vinegar, chopped gherkins, chopped parsley, chopped olives or other pickles.
- 4—Add 1/2 cup flaked salmon to 1 cup mayonnaise, 1 tbsp. lemon juice, 2 tbsps. chopped pickles, 1 hard cooked egg chopped. Serve with asparagus tips and lettuce.
- 5—Add 2 tbsps. peanut butter, 1 tbsp. olive oil, 1 tbsp. tarragon vinegar, 1/2 tbsp. lemon juice and a dash of paprika to a cup of mayonnaise.

A rich, highly seasoned

cooked dressing, suitable for either meat or vegetable salad is often a welcome change, besides appealing to some who do not care for oil dressings. The "makings" are usually on hand:

Cooked Salad Dressing

2 whole eggs or 4 egg yolks
1/4 cup vinegar
1 tsp. butter
5 tsp. cream cheese
2 tsp. cream
1/2 tsp. sugar
1/2 tsp. salt
1/4 tsp. mustard
1/8 tsp. paprika
1/8 tsp. celery seed
3 drops Tabasco sauce

Beat eggs and vinegar together until smooth, cook in double boiler until as thick as cream. Remove from the heat, add butter and cream cheese and stir until smooth; then add cream and seasonings. Omit cream cheese if desired and substitute for it, cream either sweet or sour. Makes about 1 cup.

By using gelatine in some form, salad materials may be held together to make attractive colors and shapes. The acid flavored gelatine is good with fruits or vegetables and the newer meat aspic gelatine is particularly good for meat salads.

Getting Rid of Spots and Stains

(Continued from opposite page)

position. A good old method is to soak the stain in raw milk (not pasteurized) until the milk becomes sour, and then deal with the spot as you would a milk stain. The first thing to do when ink is spilled on a rug is to cover the spot with Fuller's earth, cornmeal or salt and brush off as soon as it becomes discolored. If the rug is absolutely fast color, a paste of Fuller's earth and water may be put over the spot and left to dry. Then brush off. Other treatments for ink are ammonia followed by vinegar; oxalic acid followed by ammonia; hydrogen peroxide followed by baking soda or a paste of peroxide of hydrogen and soda spread on the spot; steam the spot while the paste is on it. Thorough rinsing should follow the application of any of these materials; it oftentimes is a question as to how much of the color one is willing to remove from the rug to get the ink out. Quick action to prevent the ink from penetrating into the fiber and the use of absorbents is safer.

IRON RUST may be removed by placing salt moistened with lemon juice over the stain and laying the garment in the sunshine. Other remedies are to use iron rust soap, or concentrated oxalic acid solution a few drops at a time with the stained material spread over a bowl of hot water. Apply the solution, then rinse out and follow with another application if necessary. Use a few drops of ammonia in the last rinse. Remember that oxalic acid is poisonous and should be labeled carefully.

QUESTIONS

(Send your answers to the following questions to American Agriculturist Cooking School, Box 367, Ithaca, N. Y., not later than February 18.)

- 1—What do salads add to meals besides pleasure?
- 2—What inexpensive salad greens are easily available now?
- 3—What kind of salad and what dressing would you serve with this meal: roast fresh ham, candied sweet potatoes, spinach, brown betty pudding?
- 4—Make a menu featuring a hearty salad.
- 5—What do you consider the most important points to remember in making salads?
- 6—Imagine that you have weekend guests: what salad dressings will you have ready in the refrigerator? How will you vary them and name the salads you will serve with these variations?
- 7—What makes mayonnaise thick?
- 8—Why does French dressing separate upon standing?
- 9—Give two advantages of a cooked salad dressing.
- 10—What salad is used most often in your family? What is the reason for its popularity?

WE MIGHT HAVE TO STOP OVERNIGHT IN TOWN AND MAW SAID SHE WOULDN'T FEEL AT HOME IN A HOTEL

For Quick Cough Relief, Mix This Remedy, at Home

No Cooking. No Work. Real Saving.

Here's an old home remedy your mother used, but, for real results, it is still one of the most effective and dependable for coughs due to colds. Once tried, you'll swear by it.

It's no trouble. Make a syrup by stirring 2 cups granulated sugar and one cup water for a few moments, until dissolved. No cooking needed—a child could do it.

Now put 2 1/2 ounces of Pinex into a pint bottle, and add your syrup. This gives you a full pint of truly splendid cough medicine, and gives you about four times as much for your money. It keeps perfectly, tastes fine, and lasts a family a long time.

And you'll say it's really amazing for quick action. You can feel it take hold instantly. It loosens the phlegm, soothes the irritated membranes, and helps clear the air passages. No cough remedy, at any price, could be more effective.

Pinex is a compound containing Norway Pine and palatable guaiaicol, in concentrated form, well-known for its prompt action on throat and bronchial membranes. Money refunded if not pleased in every way.

The Blimp and The Rogue

The Amateur Poet's Corner

ONE MORNING while up making observations in a small dirigible that the British and the South Africans used in their campaign against German East Africa two young aviators had a novel adventure, not with Germans, but with another doughty belligerent of that region.

The scene of the adventure was a great tract of high grass and canes between the Ruaha River and Lake Rukwa. One of the aviators was a Scotchman from Johannesburg, named McLellan; the other was an Australian from Sydney, named Gurney.

The engine of this blimp—as dirigibles that are provided with motive power are often called—had gone wrong, and the aviators were using their craft as a captive balloon. They had sent it up to a height of five or six hundred feet when a sudden squall struck them and set balloon and observers adrift.

"When the tornado first struck us," young Dugald McLellan said in relating what followed, "the balloon bobbed suddenly down a hundred feet or more before the cable broke. The basket swung and twirled about in a manner past belief. I thought we should surely bump against the earth at the end of the rope; but the rope broke, and away we went off across the savanna to the west of the cantonment. The squall swept us on, twirling and tumbling, and all we could do was to hang on.

"I suppose we went fifteen miles in as many minutes. The squall abated as suddenly as it had struck us, and we let out gas at once so as not to be carried farther away. We were sagging slowly toward what seemed to be a sea of high yellow grass with here and there a few palm trees, when suddenly I made out the brown backs of a whole herd of elephants disporting themselves about a water hole beneath us.

"Three or four of them raised their trunks, and then their ears. They had either seen or scented us. A big tusker, the leader of the herd, trumpeted gruffly twice, and then away they all ran, thirty or forty of them.

"'Lucky they're shy!' Gurney exclaimed. 'If they had taken a notion to investigate, it might have been unpleasant.'

"We were now wholly clear of the squall and in a dead calm again. But presently a little breath of air took us on for two or three hundred yards toward a number of palms and some thickets on the bank of a creek. We wished to save the balloon if we could, and I now threw out a grapple and line, hoping to catch something and come to a standstill, so that we could let out the rest of the gas and fold up the bag before starting to make our way back to camp. The grapple caught in brush.

"'We may as well fetch her down here,' I said; and Gurney pulled the valve open again, to let the rest of the gas go.

"At that moment we heard a fiendish shriek close by, and there rushed out of the shade of some palms, where he had been lying up, the ugliest old tusker ever hunter set eyes on!

"The moment I saw him I knew he was a rogue. Very often there is one hanging round the outskirts of a herd—an old male elephant, generally a big one, that has long been the herd leader. Time has begun to tell on him, and of late some lusty young male has rebelled against him. There has been a battle, with the rest of the herd looking on, and the young champion has run the old leader out and taken his place. The old boy doesn't like it a bit. He hates the big, impertinent youngster, and he would kill him if he

could. Generally he tries to, time and again, but he only gets a worse drubbing and maybe breaks a tusk. The young lady elephants flout him when he comes sneaking up to the herd, and as soon as the young champion spies him he has to run again, or catch it worse. He sinks lower and lower in public esteem and in his own. He grows bitter and misanthropic and gets cross and dangerous to everything that comes near.

"I knew that this was a rogue the instant he charged. The basket was now just brushing the top of the grass, and the brute looked so savage that Gurney jumped out and dived into the high grass. I grabbed for a rifle we

By C. A. STEPHENS

had aboard. As Gurney jumped, the balloon, relieved of his weight, started to rise again.

"That elephant was so close to us that he actually reached for the basket with his trunk. I shall never forget how red his wicked little eyes looked, how his big leathery ears stuck up, and what a perfectly fiendish scream he sent at me as the basket swung over his head.

"Gas was whizzing out all the while, for Gurney had tied the valve cord down, and the balloon had not risen more than twenty feet before it began to settle toward the earth again. The whole big sack was flapping and collapsing overhead. The basket banged against one of the palm trees, fouled the drooping leaves, then swung out over the open creek bed and came down suddenly in water and mud.

"I hadn't jumped, and the whole tangle of cords and collapsed sack flopped down over me, but not before I caught sight of the old tusker smashing through the thickets and wallowing in the creek bed. He still wanted me! But I was so completely tangled in all those cords that I couldn't have run if I had tried; and in a moment more the whole sack was down on me.

Whether I should be smothered with gas or crushed under water by the weight of the balloon, I did not know.

"Fortunately, the water was not deep; the basket did not settle much, and its sides held the sack up off me. I lay still, for I could hear old leather-ears splashing round and tugging at the network of cords. I imagine that he didn't like the smell of the gas. He blared now and then as if he were puzzled; evidently he could not make out where I had gone.

"What had become of Gurney I didn't know, but I guessed that he was hiding in the grass. As it turned out, he was equally anxious about me; and by and by I heard him call to me in low tones from behind the creek bank.

"I did not dare answer at first, but the old outlaw heard him, too, and, after listening a moment, rushed up the bank to hunt for him.

"'Look out!' I shouted. 'He's coming!'

"I didn't know it at the time, but while the elephant was down by the balloon Gurney had crawled to the foot of a small palm and had shinned up the trunk to where he could throw one leg over the stem of a drooping frond. From that perch he had looked down into the creek bed to see what had become of me. I had kept so quiet that he had been afraid I was killed. At last he had shouted. He was up high enough to be out of reach, and when I answered he shouted again, 'I'm all right!'

"But at sound of his voice the tusker rushed in that direction and, coursing round the palm tree, blared at him. Finding Gurney out of reach, the creature threw a turn around the palm with his trunk, and settling back, gave two or three tugs at it, but failed to break the tree.

"While that was going on I squirmed round in the basket, got hold of the rifle and sprang in a cartridge; then I managed to thrust aside the folds of the big sack, so I could peep out from under them. I couldn't see much; but I hailed Gurney again and found where he was. We talked a little back and

Fog

I like the fog
When it seems to me
I'm alone in the world, no house nor tree,

Just myself, the sand
And the lip of the sea.

I like the fog
Though it hides the sky.
No frantic humanity hurrying by,
Just the song of the waves
And a sea-gull's cry.

I like the fog
And the mournful knell
Of the rocking buoy with its swinging bell
That tells a late fisherman
"All—is—well."

—Bessie M. Kelley,
East Hiram, Maine.

forth, trying to hit on some plan to get out of the scrape.

"The old rascal is listening!' Gurney shouted. 'Look out! He's going back to you!'

"I heard the beast come splashing down into the mud and water, and a moment later I saw one of his big legs swing past the opening that I had made for the rifle. I let drive, and I knew that I had hit him.

"A rogue elephant is a queer beast, cowardly, vindictive and murderous. No elephant likes to get hurt. Wound a lion or a rhinoceros, and he will come for you; but if you wound and really hurt an elephant, the chances are that he will run away. This one did. When he felt that bullet he put off up the bed of the creek, trumpeting to wake the dead.

"We waited a while, till we felt sure that the elephant wasn't coming back; then Gurney slid down and helped me lift the folds of the balloon so that I could crawl out. We took our bearings and started back for the cantonment. Traveling through that high grass was not easy; but after three or four miles we met a mounted detail out in search of us."

See Europe With Us

WHEN YOU go to Europe with a party of *American Agriculturist* folks, you are sure of three things: Travel comfort, with an experienced escort to relieve you of all worry; a pleasant, friendly group of your own kind of people to travel with; and a trip carefully planned by us to include all the things that you will want to see on the other side, at a reasonable cost.

This is the first European trip that we have ever sponsored, and we are handling it in cooperation with the Canadian Pacific Steamship Line and the Travel Service Bureau of Newton Center, Mass. The price of your "all-expense" ticket will take care of everything, and will be less than it would cost you to go alone. Besides, you will be free to enjoy the trip without having to fuss with any of the details of getting from place to place. This is a special boon in Europe where strange languages and customs barriers make traveling difficult for inexperienced tourists.

Our next issue will carry a full announcement of this unusual trip, including its reasonable cost. Watch for this.

The Song of the Lazy Farmer

other one would head off for the setting sun. It's lucky that Mirandy sent to town to get some liniment; next week, if I should live till then, my legs may hold me up again; my spirit still is young and free, but them old joints went back on me!

THE winter-time's the time for me, it's good to be alive, by gee, when air is crisp and full of pep it puts the life into your step, the ozone in the atmosphere just throws a feller into gear. On zero days, beneath our feet the crunch of snow is sharp and sweet; in summer-time I like to swim, but now when full of winter's vim it's skating that appeals to me, or sliding downhill on a ski.

The other day when ice was slick, I couldn't stay home from the crick, the boys was shoutin' in their glee and so I thought that I could be as young and frisky as them kids. It beats all how a feller skids when he ain't skated for some years; I landed first upon my ears, and when I tried again, perchance I should have skates upon my pants. I sure put on a first-class show, that's why the kids all cheered me so; I couldn't make my legs stay put, for ev'ry time my starboard foot would start northeast, the

gray and beige, with pale blue for evening wear and rosy pink shades for daytime. These daytime ensembles of lightweight woollens or crepes are made up of dress and little jacket. Both materials are handled alike, with shirring, wide skirts and detailed sleeve characteristics.

JACKET DRESS PATTERN No. 3038 is portrayed in black with lively red applique embroidery on the sleeves and a matching colored sash, but is equally suitable for pastel color combinations, teal blue dress with rose jacket or pastel gray dress and purple jacket, for instance. Pattern sizes are 14, 16, 18, 20 years, 32, 34, 36, 38 and 40-inches bust. Size 16 requires 2 $\frac{7}{8}$ yards of 39-inch material for dress; $\frac{7}{8}$ yard of 39-inch material for jacket; and $\frac{3}{8}$ yard of 35-inch material for girdle. Embroidery Pattern No. E-11176 costs 15c extra.

CHILD'S ONE-PIECE DRESS PATTERN No. 2925 is lovely, besides being very easy to make if one uses the new elastic thread for shirring. Navy blue woolen with detachable white pique collar, or cotton percale print in wine background with wine grosgrain ribbon bow to accent the quaint tied neckline, are ways to develop this useful design. Pattern sizes are 6, 8, 10, 12 and 14 years. Size 8 requires 2 $\frac{1}{4}$ yards of 39-inch material with $\frac{1}{4}$ yard of 39-inch contrasting for long sleeved dress with collar.

TO ORDER: Write, name, address and pattern size and number clearly and enclose 15c in stamps. Address Pattern Department, *American Agriculturist*, 10 North Cherry St., Poughkeepsie, N. Y. Add 12c for a copy of our new Spring Fashion Catalog.

Prize Winners

SOME TIME ago we asked for letters on the subject "My Idea of a Perfect Farm Wife" and "My Idea of a Perfect Farm Husband." Prize winners in this contest are:

MEN

1st prize of \$5.00—James Morse, Levanna, N. Y. Honorable Mentions to receive \$1.00—A. H. deGraff, Gouverneur, N. Y.; Leo B. Rice, Milan, Pa.; A. L. Richardson, Red Creek, N. Y.; Charles W. Smith, Skowhegan, Maine.

WOMEN

1st prize of \$5.00—Mrs. Lola Waterman, Sabattus, Maine. Honorable Mentions to Receive \$1.00—Mrs. E. G. Davison, St. Johnsbury, Vt.; Mrs. Fred H. Snyder, Churchville, N. Y.; Mrs. Shirley Goodell, Sanbornton, N. H.; Mrs. Clifford Merchant, Williston, Vt.

SWING'S the Thing

THE NEW thin woollens in pastel colors are accented just now for resort and cruise wear; they are equally useful for stay-at-home folk who want new clothes that look toward spring yet have sufficient warmth for winter temperatures.

Favored colors are bon-bon pastels,

LAST CALL FOR CALIFORNIA TRIP!

IF YOU ARE thinking about joining our California Tour and have not yet sent in your reservation, better do so at once. Our party leaves in about three weeks — February 25th is the date. You can make your reservation by sending in a deposit of \$5.00 to E. R. Eastman, editor of *American Agriculturist*, Savings Bank Bldg., Ithaca, N. Y.

We have no hesitation in saying that this trip will be one of the most interesting and enjoyable that we have ever planned. In the three weeks that we will be gone, our party will go from winter to the land of sunshine, will see the snow-clad peaks of the mighty Rockies, the Grand Coulee Dam, the great cities of the West, the World's Fair on Treasure Island in San Francisco Bay, the famous Mission Inn, Hollywood, and orange groves and packing plants in California's Orange Empire. Climax of the trip will be a visit to the world's most stupendous chasm — the Grand Canyon of Arizona.

An experienced escort will look after our comfort and relieve us of all travel details. Accommodations and meals will be of the best, and so will the company! Folks who go on these tours of ours are so congenial and have such a grand time together that *American Agriculturist* travel parties are famous for the long friendships that have grown out of them.

If you can possibly go, act now and make your reservation, for they are going fast. The entire expense is approximately \$325, depending upon where you live. All payments, including deposits, will be refunded in full in event you are unable to make the trip when the time comes to go.

A copy of our itinerary, giving full details of the trip, will be sent upon request. Address *American Agriculturist*, Savings Bank Building, Ithaca, N. Y.

Planting to Last

(Continued from Page 8)

living on a farm than that, and we got to feeling it pretty strongly the other day when we were planting the little fruit trees and began to realize that some of them would probably be living and producing long after we'd stop doing either. That didn't make us feel sad at all; indeed, it was a cheerful, stimulating thought — now there'll be something around here (we ruminated) when we aren't around here anymore, to show that we once lived on this farm and contributed something to it while we were on it and that all those old Lees and Jewels and Harrisons didn't do quite all of it. And some day pretty soon, when we get a little more

BABY CHICK CONTEST

Are you working on the Baby Chick Contest announced on page 5 of the January 21 issue?

A good many contestants have already sent their answers, but you still have plenty of time as answers may be mailed up to February 20.

caught up, we'll start planting things more lasting than apples or quinces. We'll plant a few oaks, perhaps; and when we build things, we'll build them of granite.

milk

HERE'S an inexpensive and pleasant way to help ward off this winter's sniffles and sneezes. Simply add a glass of fresh milk to your daily menu.

Milk offers two cold-resisting benefits. First, it aids the alkaline reserve. But more than that, milk is a rich source of Vitamin A. This is the anti-infective vitamin which helps you build resistance against respiratory troubles. Your system will store up Vitamin A, which means that the milk you drink today will benefit you for months to come.

FREE, "MEALTIME MAGIC WITH MILK." Want something new in recipe booklets? "Mealtime Magic with Milk" contains delicious, wholesome and unusual dishes that the whole family will enjoy. Simply send a postcard with your name and address to: Bureau of Milk Publicity, Albany.

E. R. STONE & SON
CLYDE, NEW YORK

Kernels, Screenings and Chaff

By H. E. BABCOCK.

MY PHILOSOPHY toward farming is that it never will be a means of making many people rich. Therefore it seems to me that the wise farmer instead of striving and straining *with all his energy* for wealth by farming, will devote at least part of his efforts to utilizing his farming as a "way of living" for himself and his family.

To pave the way for such an adjustment, farming as a "way of living" needs to be developed and sold. Furthermore, it needs to be implemented by hard roads, electricity, and reduced taxes on real estate.

SOCIAL ACCEPTANCE

Conditions in cities and towns since 1929 have done much to restore the social acceptance of farm life. The cooperative movement in agriculture, by enabling farmers to meet industry on equal terms, especially has done a lot to give farmers self-confidence. For a time the research and educational activities of the state and federal governments were very helpful too, in dignifying farm life and pointing out ways and means of making it more worth while.

Then Washington fell for the idea of production control. Farming, as a "way of living", was forgotten. The desperate financial plight of farmers was advertised to the world. Millions of dollars were doled out as cash bribes to secure farmers' support of schemes in which they did not believe and which they knew wouldn't work *because they themselves would not honestly make them work.*

As a result of such propaganda, the social standing of farming slipped badly, not only with the general public, but among farmers themselves, many of whom first found out how bad off they really were by reading about it or listening to AAA officials.

CHEAP FARM CREDIT

While the New Deal was making a mistake in one direction, however, it was rendering farmers a great service in another. Through the agency of the Farm Credit Administration, it was making capital available to agriculture for long terms and at low interest rates. By this legislation, an essential contribution was made towards enabling farmers to buy farms and use them for a "way of living". With the farmers of the nation generally refinanced at low interest rates and no longer in danger of summary foreclosures, *there exists the finest opportunity in our history to develop farming as a desirable "way of living" and to secure social acceptance of the idea.*

REDUCE TAXES

The first essential step to making farming available as a "way of living" to a large segment of our population is to *reduce taxes on real estate.* This means nothing more nor less than a shift of taxes to some other base *than land.* I say this reluctantly. It

would be better to reduce governmental expenses, but you and I won't live to see this done. About the best we shall be able to do will be to hold them somewhere near where they are now. Do you know a single office-holder who will quit or whose job is not wanted by someone else—probably a friend or a relative of yours?

EXTEND ELECTRIC LINES

Public utilities have probably milked their stockholders and patrons of enough money to have electrified pretty well the open country. They are "on the spot" now and want to show how serviceable they can be. Well, let them take cheap electricity to all farmers. I think

Fourteen years ago we sold the sire of this grade Guernsey cow, Katrina, to Tom Milliman, whose Hayfields Farm, Churchville, N. Y., grows alfalfa enough each year to support a herd of 70 Guernseys and supply the market with around 100 tons of surplus.

At 12 yrs. of age, Katrina completed a 365-day cow testing association record on twice a day milking of 18,181.2 lbs. of milk testing 3.7 per cent for a total butter fat of 685.6. At Sunnyside we are expanding our Guernsey herd with blood lines which have produced several cows of the general type and productive capacity of Katrina.

they are alive to this opportunity.

MAINTAIN HARD ROADS

As long as we must have work relief, there is nothing which can be done with such labor which approaches road building in public usefulness. Hard roads are a key to farming as a "way of living".

NOT LEAST

Last but not least, in any turn of agricultural thinking which will lead farmers to cash in on agriculture's greatest asset—the opportunity it gives men, women, and children to live under wholesome, healthy, and spiritually satisfying conditions—must be listed *the development of the farm itself along lines that will make it more self-sustaining.* But this is another story.

* * *

Poultry Notes

Gradually as we accumulate experience, we are drawing some conclusions about the type of poultry enterprise which on the record pays us best. *This does not mean of course that our conclusions are sound for anyone else.*

CROSS-BREDS

We are tending more and more to buying cross-bred chicks produced by mating Rhode Island Red roosters with

This is a Doodle-bug. Doodle-bugs are cross-breeds. They are produced by mating a passenger car with a truck or a tractor. This particular Doodle-bug has easily pulled a two-bottom plow in alfalfa sod. It was built for Tom Milliman, Churchville, New York, at a cost of \$340.46, itemized as follows:

Buick 1929 Master "6" sedan.....	\$ 65.00
Used truck rear-end and wheels.....	30.00
Used truck transmission.....	5.00
Covering for top, irons, and tacks.....	4.60
2 Model A Ford bucket seats.....	2.00
2 24" Rims for rear wheels.....	13.86
Welding rims and assembling.....	15.00
Complete paint job.....	10.00
2 9x24 Tractor tires and tubes.....	90.00
Labor and minor parts including drawbar	105.00

pullet and get her to lay 100 eggs in the first year of her life. We try to have 85 per cent of the chicks we buy alive one year from the date we buy them. We try to sell the 85 per cent, when one year old, at a profit over what the pullets cost in the laying house. We still fail to hit *all three of these marks* about 50 per cent of the time.

* * *

Farm Motor Equipment

Unless one is in a position to hear from farmers over a large territory, he can have but little idea of the *enormous amount of work* which is being done on farms this winter to adapt motor equipment to various tasks and to save on the cost of it.

Apparently we started something with this page when we began to write about (1) a passenger car which could double for a pick-up truck, (2) a truck which could do the work of a tractor, and (3) a tractor-trailer combination which could be used on the road as a truck.

We use all three of these combinations in our farming operations. These, as you know, are based on two owned farms and several leased ones. Since we always keep the way open to retreat from our big operation by dropping our leased farms, we are always studying our equipment to determine which items we would keep on a two-man farm.

On one point we are agreed. The passenger coach with the reinforced rear springs and the rear end of the body adapted for pick-up truck work is the most useful item of equipment we own. On most farms it might be standard equipment. Really I can't see why more passenger car builders don't adapt at least one model to the needs of farmers.

When it comes to the choice between a truck, convertible to a tractor, or the tractor-trailer combination, we can't make up our minds except that we are sure that on a smaller farming operation *we can't afford both.* It seems to us that the final decision must rest on whether the farm most requires trucking or tractor work.

Plymouth Rock hens. A reader has written in that this is the wrong cross to use. He says it is better the other way around. We buy this cross because the pullet chicks can be told from the roosters when they are hatched. *By buying only pullet chicks, we keep our investment in chick raising equipment down to a minimum.*

LIVABILITY

It has been our experience that the key to making money out of hens, in our case at least, is to keep the birds alive and laying. *Laying house mortality is pretty generally played down by poultrymen.* Why, I do not know.

We have gained on ours by (1) using cross-breeds, (2) raising our chicks on a farm where no old birds are kept, (3) getting the chicks out on the ground as rapidly as possible, (4) leaving them on the range until they are laying at least 30 per cent, (5) feeding them all the yellow whole corn they will eat from the time they are about six weeks old.

PRODUCTION STANDARDS

We have never set up our production standards according to the hatchery catalogs. Instead, we have been guided by Cornell's cost account figures on good sized poultry farms. Now, we have our own standards. *We have attained these standards three times with pens of 500 birds.* We try to raise a

Conducted by H. L. COSLINE

Can't Be Found

"I sent \$1.75 for power glasses to the Perfecto Products, Los Angeles, California, last October, but as yet my order has not been filled although they cashed my check."

Our letters to this company were returned, indicating that the company had moved leaving no address. Mr. John E. Pickett, Editor of the Pacific Rural Press, whose cooperation we very much appreciate, tells us that the address given by the Perfecto Products was the vault service of the Merritt Building. An interview with one of the elevator men in the Merritt Building revealed that there was no such concern in the building. However, he did find out that the company had mail service at that address but had not called for mail for some time. Later developments revealed a forwarding address at 160 North Broadway, which is the number of the Hall of Justice! We regret that we have been unable to locate this concern.

Money Not Turned In

"Last November I paid a Mr. Emmick \$18.50 for an automobile insurance policy. He gave me a receipt with the company name on it. I had an automobile accident December 31st and now the company states that Mr. Emmick never turned in the money for the policy. It seems to me that we should be compensated for that accident."

The insurance company states that Mr. Emmick's license to represent the company was terminated last July, and cancelled by the State Insurance Department. It is unlawful for any agent to sell insurance in Pennsylvania without a state license, therefore, the company is not liable in any way for the accident. This experience indicates that it is important to ask insurance agents to show their licenses and to check up and see what has happened if the policy does not arrive promptly.

No Work

"I answered an ad in a paper put in by the Quality Dress Company of New York City. The ad states 'upon receipt of the enclosed blank, we will ship complete working set with full instructions; everything furnished.' I need the money,

but before I go further, I would like to be sure that this company will do as they say."

As far as I know the company will do as they say BUT if you will read the material carefully you will find that they do not promise to do much. The company asks for a \$2.00 deposit "to cover the cost for making the first dress." The important point to remember is that Quality Dress makes no offer to sell the dresses you make. They will sell you the materials, then it is up to you to find your customers.

It is apparent from the flood of letters we have received about this concern, that many assume that the company will furnish the material, pay for making the dresses and then sell them. It seems obvious to us that any one who has the ability to sew can buy the materials locally and then find customers for the finished products.

Information Wanted

If any of our readers could help us locate Mr. and Mrs. Paul Pascal, formerly of Rensselaerville, New York, we would be glad to hear from them. It is thought these people may be now living somewhere in New Jersey.

A subscriber gave an order for a rug to C. J. Rostiser, who claimed to represent the Conkling Rug Co. of Syracuse, N. Y. The subscriber paid the full amount for the rug, and the money was not turned into the company.

We are very anxious to get in touch with Mr. Rostiser, and will appreciate any information which will help us get hold of him.

Pictures

The Federal Trade Commission has been working to investigate the actions of a couple of picture enlarging concerns. It appears that they use the lucky envelope scheme in which the customer is supposed to pick out an envelope among several. There are usually no blanks, in other words, everyone who draws an envelope is "lucky". The idea of course is to get customers to sign orders for enlargements and frames.

It is further claimed that the agent offers to make a genuine hand-painted oil portrait or picture. However, the finished product is merely a photographic enlargement tinted by the use of water colors or crayon, said to cost about \$1.25. The frames cost from 75c to \$1.75.

Because of the many serious complaints we have received from subscribers we have come to feel that it is unwise to buy enlargements from these agents. Photographic enlargements made by your local photographers are cheaper and if you wish them colored it will not add much to the cost.

\$25.00 Weekly Benefit

Specified Sickness and Accidents

Men and women accepted — ages 15-69 at \$10.00 a year. No medical examinations. Policy pays on specified sickness and accidents. Write for full details.

North American Accident Insurance Co. Savings Bank Building, Ithaca, N. Y.

C. ADELL KAYNER, Corfu, N. Y., was killed in this accident.

IN JUNE Mr. Kayner paid our agent, Charles Ingraham, of Batavia, N. Y., \$1.00 for an automobile, travel accident policy. The policy was dated July 1, 1938. Driving up to Corfu on December 12, the unexpected happened — Kayner's car was struck by the train. Mr. Ingraham has just delivered to the family a check for \$500.00, death benefit payable under the policy to those over the age of 60 years. Between the ages of 15 and 59, the death benefit on such an accident is \$1,000.00.

\$585,573.43 has been paid

PRACTICAL SUGGESTIONS FOR Rearing Baby Chicks★

More than 90,000,000 Chicks have been reared on G.L.F. Starting & Growing Mash. The experience of users of this feed has been combined with college recommendations to make this brief outline.

1. A Clean, Warm House

At least a week before the chicks arrive, give the brooder house a good scrubbing. Brush down the walls and ceiling with a broom, and clean the floor and lower walls with a hot lye solution. Then spray or paint walls with whitewash or a good disinfectant. Wash out troughs, drinking vessels, and all equipment with a 3% solution of creolin or some similar disinfectant.

Start the brooder stove a day or two before the chicks are due, so the stove can be regulated and the house will be warm, dry, and comfortable when they arrive.

2. Fresh Litter

Cover the floor with a couple inches of clean, fresh litter—straw (preferably chopped), sugar cane residue, shavings, peat moss, or clean sand if available. Avoid straw that is chopped too fine, or dusty materials that may get into the chick's throat and start trouble. Change the litter often enough so it will always be clean and dry.

3. Have Feed Ready

Chicks are ready to eat 24 hours after they are hatched, although they can wait a day longer. Have a supply of G.L.F. Starting & Growing Mash on hand and keep a clean fresh supply of it before the chicks at all times. Keep fresh water, luke-warm at the start, where all chicks can get it. The mash should be stored in a room warm enough so it won't be chilled when you first offer it to the chicks. Feed mash alone (no scratch grains) during the first four to six weeks. This will produce better and more uniform growth. G.L.F. Starting & Growing Mash supplies not only the correct quantity of protein but protein of the highest quality, plus all the vitamins, minerals, and carbohydrates chicks need to keep healthy and make rapid gains. Place the feed and water near the edge of the hover at first. Where electric brooders are used it may be necessary to put feed and water under hover.

4. Plenty of Feeding Space

Make sure you have enough feeding space so that at least half the chicks can eat at one time. Small reel-type feeders, shallow boxes or pans, are the most satisfactory for the first week or ten days. When you switch to larger feeders, allow about eight feet of hopper space for each 100 chicks, increasing this to twelve feet when the chicks are six to eight weeks of age. Have plenty of drinking fountains so the chicks can get fresh water at all times.

5. Keep Them Comfortable

Overcrowding is one of the most common causes of mortality and poor development among chicks. Allow at least one square foot of floor space for each

Clean stove, clean walls, and clean floor are of first importance.

three chicks. Don't have more than 300 to 400 chicks in one flock to begin with and either reduce this number or provide more space as chicks approach broiler size.

6. Correct Temperature

Keep the temperature under the edge of the hover, two inches from the litter, at 95° the first week, 90° to 95° the second week, and gradually lower until no heat is needed. This procedure will vary depending on the weather; of course, the temperature can be dropped more quickly later in the spring than with early season brooding. With coal or oil brooder stoves chicks will spread out in a circle at night just outside the edge of the hover, when the temperature is correct. Room temperature should at all times be comfortable.

The hover should be large enough to accommodate all the chicks at one time without crowding when they are small. For the first day or two it is a good plan to place a circle of hardware cloth about two feet outside the brooder hover. This circle teaches the chicks to return to the brooder for warmth. After a day or two this circle should be enlarged to give more space. Later it can be removed entirely.

★ These suggestions are based on the colony house method of brooding chicks which is the most commonly used in this territory. These same suggestions apply pretty much to long house brooding. Where battery brooders are used it is best to follow the manufacturers' brooding recommendations. Starting & Growing Mash produces excellent growth on battery chicks.

COOPERATIVE G.L.F. EXCHANGE, INC.
ITHACA, N.Y.

7. Fresh Air Is Important

Give the chicks plenty of fresh air. Try to have three sides of the brooder house air-tight, and ventilate by opening and closing the windows in the front of the house according to the weather and the direction of the wind. Cold drafts, overheating, or chilling are harmful to chicks.

8. Early Roosting

Early roosting prevents crowding and spreads the birds out so they have more freedom of action. When the chicks are four to six weeks old, one or two poles or 2-inch material with rounded edges may be placed across the back part of the brooder house, a foot or two from the floor, to train the chickens to roost.

9. Scratch Grains at 4 Weeks

After the chicks reach four weeks of age, begin gradually feeding G.L.F. Intermediate Scratch Grains in hoppers in small amounts. Increase week by week until at twelve weeks the birds are eating equal parts of grain and mash. During this period, as the chicks eat more and more feed, their protein requirement gradually lowers to 14 per cent. By feeding G.L.F. Starting & Growing Mash with scratch grains as directed, this changing protein requirement is accurately supplied. Give the chicks grit of the proper size at the same time the grain feeding is provided.

10. Check Vices Right at the Start

Cannibalism is usually caused by overcrowding, high temperature, lack of feeding space, hunger, or by bright sun spots in the brooding house. If you detect picking, check for these possible causes. Then coat the wounds of the victims with bitter tasting anti-pick salve. Paint a number of unpicked chicks also, so that many chicks in the flock will get a taste or smell of the remedy and be repelled by it.

Placing the feed on newspapers or paper plates for the first day will help prevent chicks from eating litter. As soon as the chicks have learned to eat from feeders, some poultrymen build wire-covered platforms from three to six inches high for the feeders and the fountains. This keeps chicks from scratching litter into the feed or water and prevents chicks from coming in contact with the wet spots caused when water is spilled from the fountain.

11. Separate Pullets from Cockerels

As soon as sex can be determined, the cockerels should be segregated from the pullets, especially if the cockerels are to be marketed as broilers. The broilers will reach marketing size and condition more quickly if kept on the Starting & Growing Mash with little or no scratch grains.

"Far Countries for to See"

JOIN A. A.'s First GREAT EUROPEAN TOUR

By E. R. EASTMAN

*"The stag at eve had drunk his fill
Where danced the moon on Monan's rill
And deep his midnight lair had made
In lone Glen Artney's hazel shade."*

WHEN I was a boy in high school and read these lines, from Scott's *Lady of the Lake*, I used to dream and plan how on some summer eve in the years to come I, too, might stand on the shores of Loch Katrine, or visit with the spirit of Robert Burns the scene of "The Cotter's Saturday Night." Well, sir, the Good Lord will-

THE SPACIOUS DINING-ROOM on the S.S. *Empress of Britain*, the great ship with every modern convenience on which American Agriculturist folks will return from Europe next August. And the meals they will have on shipboard—and everywhere else on the trip—will be something to write home about! Want to come? See the article on this page.

COLOGNE, on the River Rhine, with the spires of one of the most famous churches in the world pointing to the heavens, Cologne Cathedral. Want to see this historic river, and these Old World places that you have heard so much about? Join American Agriculturist European tour next August.

ing, that is one lifelong wish that I think is going to come true for Mrs. Eastman and myself and for all those who go with us on *American Agriculturist's* first European tour next August. For years we have tried to arrange one of our famous tours to take in Europe, but never before have we been able to get just what we wanted, either in countries to be visited or at a cost that persons of ordinary means could afford.

Leaving Scotland, we will go down across the border into the beautiful Lake Country of old England, where lived the poet Wordsworth. Remember his poem about the daffodils?

*"Beside the Lake, beneath the trees
Fluttering and dancing in the breeze . . .
Ten thousand saw I at a glance,
Tossing their heads in sprightly dance . . .
I gazed — and gazed — but little thought
What wealth the show to me had brought . . .
For oft, when on my couch I lie
In vacant or in pensive mood,
They flash upon that inward eye
Which is the bliss of solitude;
And then my heart with pleasure fills
And dances with the daffodils."*

That's just the way we all will feel for the rest of our lives about this whole trip, for it will provide each of us with a treasure house of memories.

Farther south we will stop at Stratford-on-Avon, and visit the birthplace of William Shakespeare, greatest poet and philosopher of all time. Remember Shakespeare's chair that Washington Irving describes in his "Sketch Book"? We will sit in it!

In London Town, think of seeing the places that you and I have read about all our lives, and longed so (Turn to Page 27)

A LITTLE CHALET in Switzerland, with the majestic Alps in the background. Come with the American Agriculturist party next August, and have a look that you will long remember.

Firestone

GROUND GRIP TIRES

AMERICA'S *First Choice* TRACTION TIRES
ARE NOW SO *Easy to Buy* THAT *Every Farm*
CAN BE PUT ON RUBBER . . .

Triple-Braced Traction Bars

A patented Firestone construction feature which provides the extra traction so necessary to deliver maximum draw-bar pull for plowing, pulling and all farm operations. Only in Firestone Ground Grip Tires do you get this exclusive and patented feature.

by making a small down payment. This plan further provides for payment of the balance on terms that suit your individual requirements.

The Firestone Cut-Down Wheel Plan

provides a method for cutting down the spokes of the steel wheels on your tractor and implements. A new Firestone drop center rim is then welded to them. Originated and perfected by Firestone, this operation is quick and economical and brings you the added comfort and savings in time and fuel which only Firestone Ground Grip Tires can give you.

The Patented Construction Features and Exclusive Advantages

of Firestone Ground Grip Tires enable them to save more time and fuel, provide more traction and draw-bar pull — ride more easily and clean better in all soil conditions because the construction features which make these advantages possible are fully covered by United States patents:

Triple-Braced Traction Bars, which cannot bend, break or tear off.

Longer Tire Life, because of the patented Firestone Gum-Dipping process which protects against penetration of moisture, and provides greater strength. Patented tread compound protects against sun and weather.

Tread Guaranteed Not to Loosen, because two extra layers of Gum-Dipped cords provide inseparable union between the triple-braced tread and cord body.

Scientifically-Spaced Triple-Braced Traction Bars provide better cleaning action in all soil conditions.

52 to 89 Extra Inches of Traction Bar Length give greater earth-biting power.

32% Greater Tread Bar Surface Contact assures increased pulling power.

21% Flatter Triple-Braced Tread provides greater shoulder traction.

Continuous Triple-Braced Traction Bars, joined together for smoother riding.

The Firestone Demonstration Plan

You can prove the extra traction advantages of Firestone Ground Grip Tires on your own farm. There is no obligation for a demonstration of Firestone Ground Grip Tires. Send in the coupon or call on your nearby Implement Dealer, Firestone Tire Dealer or Firestone Auto Supply and Service Store and find out how little it costs to put your farm on rubber.

BATTERIES

For a quicker start and more of them, be sure your new battery is a Firestone. Ask about the economical Firestone Battery Changeover Plan.

SPARK PLUGS

Get better performance and greater economy from your car or truck by installing a set of Firestone Spark Plugs today.

BRAKE LINING

It takes safe brakes as well as safe tires to make a safe car. Insist on Firestone Brake Lining when you have your brakes relined.

CHARLES M. GARDNER

Editor of the National Grange Monthly and High Priest of Demeter of the National Grange.

NUMEROUS long-time Grange anniversaries in New York State are bringing together large crowds and proving significant occasions. Among the subordinates which have recently celebrated a 65th birthday have been Lyons Grange in Wayne county, with an attendance of more than 300 and with Dana P. Waldron as guest speaker; and East Fayette Grange in Seneca county, with an equally large attendance. Shells Bush Grange in Herkimer county has just observed its golden jubilee anniversary, with a stirring address by State Overseer W. J. Rich of Salem. Other birthdays of similar importance will be celebrated by Empire State Granges during the early part of 1939.

* * *

A **STRIKING** illustration of making a Grange fair pay, without any "shady" features, gambling, or other questionable attractions, is furnished by Morris Grange, No. 105, in New Jersey, which carried out such a project in the late autumn, drew an attendance of 30,000 people and made a net profit of better than \$3500 in cash. This is the fourth year that Morris Grange has demonstrated such fair possibilities and the example is a good one for all Granges and other groups. Many said it couldn't be done, but Morris Grange went ahead and did it!

* * *

FORMER STATE MASTER Albert W.

Lawrence of Springfield, Vermont, was recently the victim of an accident that nearly cost him his life. While working in his garage a pan of gasoline became ignited and Mr. Lawrence attempted to carry it out of the building. On the way the gasoline suddenly exploded, burning Mr. Lawrence's right hand severely, while his face was completely singed. Fortunately his eyes escaped injury, but it will be a long time before he can use his right hand.

* * *

PATRONS of Berkshire County, Massachusetts, are jubilant over the decision to hold the next session of the Massachusetts State Grange at Pittsfield, the dates being December 12, 13 and 14, 1939. Berkshire is one of the strong Grange counties of the Bay State and its members are already laying their plans for entertainment of the state convention.

* * *

DURING Farm and Home Week at the University of Maine in Orono (beginning March 27) Wednesday, March 29, has been set apart as Grange Day, with a complete program of varied attractions. State Lecturer Hartley M. Stewart of Houlton will be in charge and probably Granges from every county in the Pine Tree State will be well represented.

* * *

MANY REGRETS are expressed in Grange circles that Mrs. Susan W. Freestone of Interlaken, N. Y., who for a decade has been National Superintendent of the Juvenile work of the country, has felt unable to continue the responsibility longer. Mrs. Freestone has proved a very efficient leader in this branch of Grange work and under her direction the Juvenile department has prospered in nearly every state. She is succeeded in the position

(Continued on Page 25)

SEND THIS COUPON IN TODAY!

Solder It

By I. W. DICKERSON

HOOD FOR HEATING SOLDERING COPPER.—An excellent way to heat a soldering copper over an open gas or gasoline burner. About a dozen layers of sheet asbestos are pasted on the inside of a bread pan and then fastened with tin washers and nails. Holes are then cut in the end to insert the copper and hold it up off the grate. Turning down the flame holds it at any desired heat.

SOLDERING SEAM ON CAN BOTTOM.—This shows the materials and equipment ordinarily used for farm soldering, and also the proper position of soldering copper so solder will flow into the seam. The object on the right is a large crystal of sal ammoniac for testing the heat and cleaning the soldering copper.

ANYONE can do successful soldering if he will study each job carefully and see that the following essentials are secured:

1. Keep soldering copper clean, at the right heat, and properly tinned.
2. Scrape and clean thoroughly the surfaces to be soldered.
3. Use the proper flux for the given surfaces.
4. Heat both surfaces above the melting point of the solder, by applying the solder copper or by preheating with the blow torch.
5. Fasten or hold the work so solder will run into the joint to be united.

Heating the Soldering Copper

First smooth and clean the point of the soldering copper by pounding the faces smooth with a hammer or by filing with a coarse file. Then heat to the proper temperature as follows:

Heating with Gasoline Blow Torch

Best for general farm soldering, since heat is steady and easily controlled, and can be carried to the roof or the tractor or wherever needed. It is also useful for pre-heating large pieces.

Heating Over Open Burners

Most farm homes have open flame stoves burning gas, bottled gas, gasoline, kerosene, etc. It is unsatisfactory to heat soldering copper directly over these, but the use of a cover or hood heats quickly and turning down the flame holds the heat steady as desired. (See illustration). Two bricks laid a short distance apart, a third on top and another across the back also can be used.

Heating in Coal or Wood Fires

It's difficult to hold the soldering copper at the proper heat and keep the point clean in a stove, furnace, or other coal or wood fire. However, this meth-

od works fine if a short piece of pipe closed at one end or an old wagon skein is put into a hot fire and the soldering copper put inside. The iron can be heated nicely in a forge after the coal has been coked.

Failure to secure the proper heat for the soldering copper is the stumbling block for most beginners, since successful soldering cannot be done if the point is a few degrees too cool and the tinning will be burned off if the proper heat is exceeded very much. The expert solderer can tell the proper heat almost at a glance, but the beginner should go by these tests:

1. Rub the hot copper on a large crystal of sal ammoniac. If hot enough, it will give off clouds of pungent smoke.
2. If hot enough, the point should melt solder almost instantly.
3. If hot enough, the point rubbed on a pine stick should smoke freely.
4. If too hot, the tinning will be burned off the point.
5. It is much better to have it a little too hot than too cool, and the beginner will do well to keep the heat as high as possible and still have the tinning on the point bright or tinged with yellow.

Soldering Fluxes

Some kind of flux is necessary with nearly all farm soldering to keep the surfaces free from oxides and to make the solder flow more freely. The most common is *zinc chloride*, which can be used with tin, copper, brass, steel, iron, and is about the only flux which will give good results with steel. It can be secured from any tinner, or can be made by diluting commercial hydrochloric acid with an equal amount of water in a wide-mouthed glass jar. Small pieces of scrap zinc, such as can be cut from old dry cells, are then added slowly until there is no further action of the acid. This can be applied with a small brush. It is quite corrosive and should not be used on elec-

trical work, and any joint on which it is used should be thoroughly washed.

For electrical connections and radio work, a *non-corrosive soldering paste or special liquid flux* should be used. These are on the market or can be made by stirring zinc chloride crystals in water until no more will dissolve. To five parts of this solution add one part of glycerine and four parts denatured alcohol. A *non-corrosive paste flux* can be made by rubbing together equal parts of zinc chloride crystals and vaseline. These non-corrosive fluxes are also suitable for general soldering work, and can be as bright dips for the hot, tinned soldering copper.

Commercial hydrochloric acid diluted with an equal volume of water should be used as a flux for soldering zinc or galvanized iron. *Powdered resin* is the favorite flux for bright tin, and is also helpful in difficult soldering with almost any metal. Self-fluxing wire solders with either a rosin or a cut-acid core are handy to use on light jobs and in close quarters, such as electrical and radio work.

Soldering a Seam

Surfaces which are to be soldered must be as clean as possible, with all grease, paint, dust, rust, and other foreign material removed as completely as possible. Many beginners do not realize the importance of thorough cleaning and fail on that account. File, scrape, or grind the surface until the bright metal shows before trying to solder. Emery paper or steel wool is good for removing scale and rust, while soft surfaces may be scraped with a knife or a tinner's scraper. When the work is clean, apply just enough flux to be sure both surfaces to be joined are wet.

Remove the soldering copper from the fire, quickly test it for proper heat by rubbing one or two faces on the sal ammoniac crystal, dip it for an instant into a jar of sal-ammoniac or zinc chlo-

ride cleaner, touch it to a bar of solder, and quickly put one face flat against the joint, holding the work so the solder can run into the joint. Start at one end of the joint and hold it stationary until the work becomes hot enough for the solder to run freely, then draw the point down the seam only as fast as the solder will follow. When the solder on the point is used up, pick up a new charge or better hold the bar of solder to the point as it is moved along. When the soldering copper becomes so cool that the solder does not flow freely, it must be reheated. When done the seam should be completely filled, with no excess solder, and should then be scrubbed with a solution of soap and washing soda in water to remove excess flux.

Sweated Joints

Pieces of sheet metal are "sweated" together, and this is the usual method of patching a large hole in a pan. The two surfaces are cleaned and fluxed in the usual way, then each one "tinned" with a coating of solder. They are then placed together and reheated by holding the hot copper on the patch while pressing down with a stick. When the solder flows freely again, the heat is removed and the patch held down until the solder hardens.

Soldering Enameled Ware

Holes in enameled ware can be soldered in the usual way after the enamel has been removed by grinding or otherwise so as to expose a ring of clean metal. Zinc chloride flux should be used, and all excess scrubbed off after the job is completed.

Failure to pick up solder means that the soldering copper is dirty or not hot enough. Slow running solder means that the copper is not hot enough or has not been held on the surface long enough. Rough uneven solder means not enough heat. Patchy adhering means grease or dirt on the surface. Failure of the solder to run into the seam means poor cleaning, too little heat, or not enough flux to keep down the oxide.

Why One County Cut Its Taxes

PEOPLE of Westchester County, N. Y., under the leadership of the Westchester County Taxpayers Association and the Citizens Public Expenditure Committee, have won a striking victory in forcing the county to cut its tax budget more than \$5,000,000.

Westchester is one of the most extravagant counties, with one of the highest tax rates in New York state or in the Union. There just didn't seem to be any end to the politicians' spending of public funds. But there was! The people got mad. American citizens are long-suffering, but when they do rise up, look out!

They rose up in great meetings in Westchester County, and under competent leadership they demanded that the Board of Supervisors get the taxes down. The New York Times, reporting on this remarkable achievement, said:

"The Budget Committee, confronted by petitions bearing more than 12,000 signatures, eliminated all salary increases and new positions except those required by the new county charter. The Park Commission, instead of being increased from \$274,700 to \$450,626, got only \$224,700."

Assessed valuations throughout the county have been reduced by some \$30,000,000 under pressure of public opinion. Many other results were obtained.

I call attention to this achievement as an example of what can be done in other counties and towns. Not such large savings can be made, because such extravagances do not prevail in other counties. *But there is room for cutting taxes in practically every municipality, large and small, in the United States.* And it won't be done until you, the people, insist. When are you going to start?

Why This Consumer Does Not Buy Apples

AS STATED in our last issue, we have come to a time when apple growers must find some way to improve their marketing practices. We here in the Northeast have the best quality apples in the world, but we don't get the best prices.

One answer is an effective cooperative marketing organization supported by all apple growers. And another, which is suggested by the following letter, is to find some way to get quality fruit to the consumer who wants it and will pay for it. In doing this, care should be taken to avoid too much official regulation and regimentation. The whole problem needs more study than it is getting. To start a discussion and get some facts, let's have some letters from you fruit growers. Here is the picture from the consumer side:

"Your frequent apple talks on the editorial page are effective in that they just make our mouths water for a good dish of apples within reach as we enjoy the winter evenings, but we seem to have to let it go at that.

"It is a peculiar situation. We live in Essex county—one of the best of apple counties, but we just can't seem to get decent apples at a reasonable price. Some of the growers prefer to ship the best apples away or store them for higher winter prices rather than sell in the fall. If they are willing to sell locally, it is more than the apples are worth to go as far as we might have to to get them. Those sold at the store at retail prices are out of the question for farmers with very limited means. Those sold by fruit peddlers may be cheap but one seldom is sure of quality. Even the peddlers often put such a high price on them that we cannot buy even if we are sure of the quality.

"Once at silo filling time two men with a truck

load of apples stopped and asked if they could trade apples for dinners. I gave them their dinner and felt that as the silo men had already eaten and part of it had to be warmed over that the men really didn't get such a good bargain as they left me nearly half a bushel of apples. I soon felt that no matter how poor a dinner they had, I was the goat. I don't think there was a perfect apple in the whole batch.

"Other similar experiences have made me feel that it is hardly safe to buy apples from the trucks. One time I bought a peck—every one was bad. The truckman came again in about a week and I told him about them. He was very sorry and said he would make it up on the next trip. There wasn't any next trip.

"That is why many of us around here are without the joys of an apple barrel down cellar.—Mrs. R. E. P., New York."

Is Weather Changing?

ROMEYN BERRY was in the office a couple of weeks ago—about mid-January. He said that he was going to set his hired man to plowing that same afternoon. I remarked that I couldn't remember such fine mild winter weather. "Nonsense", said Rym, "old records are full of references to such weather in the wintertime. Every little while," he continued, "people get the idea that the climate is changing, but I have seen records that go back for half a century, and they prove that we have just the same kind of weather on the average that we ever had."

Romeyn is right, of course. People just forget what happened years ago, and are only impressed by what is happening now. You often hear the argument that they used to have more sleighing than they have now. Of course that is

Into my office the other day came an old friend, Fred Stevens. He handed me the above picture of his uncle, D. W. Stevens, sitting on a monument on the Gettysburg battlefield in 1938 on almost the exact spot where he fought in the great battle in 1863, 76 years ago. This old soldier, still living, enlisted at Elbridge, New York, and now lives in Wasco, Illinois. He lost an arm in the wilderness fights.

As I looked at his picture I wondered what he was thinking while he sat there on that monument. If you have been to Gettysburg, you know what a quiet and peaceful countryside it now is. So it must have been hard for the old soldier and others from both North and South who came back for the 1938 reunion, to visualize all the noise, confusion and turmoil of that old fight so long ago. Perhaps it now seems to him like a dream, and he wonders what it was all about!

so, because they scrape the roads now, and the snow melts faster anyway on the hard roads than it did on dirt roads.

But, then, if you want to argue with Romeyn and me about this weather business, go ahead. We will print your letters.

Seed Time May Be Weed Time

IT IS SAID that the pioneer was bothered with few weeds, that they came mostly with civilization. Certain it is that all of us can now name dozens of familiar weeds with which we have to contend that were unknown to our grandfathers.

The largest source of weed seed, and the chief way by which they are spread, is through seed. It will soon be seed time. It follows, therefore, that the best protection from weeds is to buy high quality seed that is free, or as nearly so as possible, from weed seeds.

Chosen People

"Those who till the soil are the chosen people of God."—Thomas Jefferson.

I SUPPOSE we ought to take a strong statement like that with a grain of salt, for of course the farmer is a human being, and all of us know several of the cantankerous variety. Nevertheless, environment is nature's greatest mold. We are what we are largely because of our surroundings. Heredity and environment are nature's strongest influences, and the farmer has the advantage of all others in his environment.

Few indeed are there who can walk through an orchard at blossom or harvest time without being a little different than they were before. No one can watch a young tree or animal develop without consciously or unconsciously being influenced by the power of nature and of nature's God. No one can grow a good crop, or see the sun rise in the morning and set at night, watch the coming of the rain and the sun, feel the wind upon his cheek, and watch the rolling seasons, without being influenced toward higher and better things.

Therefore, so far as a man is susceptible to his surroundings, the farmers are chosen people of God.

Eastman's Chestnut

I THINK my bad disposition got its start trying to teach calves to drink when I was a kid. I never could get anywhere with the little brutes without putting my fingers in their mouths and shoving their noses down into the milk. Then the calf was sure either to bite, tip the pail over, or at least snort and blow the milk all over me.

So I have very much of a fellow feeling for the old Yankee deacon who started on his way to church one bright Sunday morning and then happened to remember that he had not fed the calf. He went back to the house, carefully warmed the milk, took it to the barn, and started in to feed the new calf without changing his clothes. Any farmer can guess what happened. The calf stuck his head down in the pail, caught the bail on the back of his neck, snorted, reared back, threw his head up, pail and all, and poured the milk down the legs of the deacon's Sunday-go-to-meeting suit.

Gripping the calf by the ears, the good deacon pumped his head violently up and down into the pail, and shouted:

"If I were not a deacon and a pillar of my church, I would jam your blankety-blank head right through the bottom of this blankety-blank pail!"

Are Dairymen Being CHEATED in Butterfat Tests?

By E. R. EASTMAN

A FEW DAYS ago a dairyman walked into my office and asked me what I would do if I were in his position. He said that he was positive that the milk dealer to whom he was selling his milk was cheating on the butterfat test. So sure of this was my farmer friend that he had had his milk tested two or three times in the Cornell laboratories, and each time the test was considerably higher than he got from his dealer. "That being the case," said I, "I would certainly go straight to that dealer and demand a square deal." "It won't do," said my friend, "for, should I do this, within a month some excuse would be found by my dealer for refusing my milk, and I would be without a market." Then he went on to say that the difference between what his milk really tested and what the dealer gave him amounted to a good many dollars in a year.

There is probably not a single dairyman who has sold fluid milk for any length of time who has not believed at some time or other that he was being cheated in his butterfat test. Because both the individual cow and the dairy herd vary so much in their butterfat, I used to think that almost always farmers were mistaken when they claimed that they were not getting the test to which they were entitled. NOW I AM NOT SO SURE.

In the large dairy county of Delaware, New York, where I was county agent years ago, I had general supervision of ten cow testing associations. I found that when farmers joined these associations they would quit complaining about their butterfat test. I thought then that when their own records showed how their cows varied from day to day they realized that they were wrong in thinking that the dealer was cheating them. In thinking this over since, however, I have concluded that maybe in some cases the farmers in the cow testing associations quit complaining because the local plant manager, knowing that the farmer knew what his test actually was, was more careful to give the farmer his rightful test.

Can So Many Farmers Be Wrong?

Now, there is enough trouble in the milk business without my stirring up any unjust suspicions. That is the last thing I want to do, and I want to say right here that I believe that most dealers are absolutely honest in their butterfat test, and that farmers are often wrong when they think they are being cheated. But there is enough evidence accumulated on the other side of the picture so that it is time that this subject is given an airing, both for the benefit of farmers and of honest dealers. There is an old saying that where there is smoke there is fire, and I don't believe that so many farmers can be wrong all the time in their belief about the test.

One of the troubles with the butterfat test situation is the pressure of milk companies to make their plant managers come through with a good butterfat record. In an effort to do so, and to hold their jobs, without doubt some of these plant managers are tempted to play fast and loose with the butterfat test. So, while the companies themselves may be honest, their policies may have forced some of their representatives into ques-

tionable practices so far as butterfat is concerned.

How the State Helps

So emphatic has been the farmers' belief that they were not getting a square deal in the past, that the State of New York and some other states assume the responsibility, through departments of agriculture and markets, of checking up on the butterfat tests. Here is how it is done:

Where a milk buyer pays for milk on a butterfat basis, the New York State law requires that, on request of the producer, the buyer shall keep duplicate composite samples, and at the end of the period for which the sample is kept, the producer has his choice of the two composite samples, both of which shall be sealed.

The producer can then send this duplicate composite sample to the State College within ten days, where it is tested for butterfat as a check on the buyer's test. Also, buyers are required to re-seal the bottle containing their composite sample and to keep it for at least ten days to permit the Commissioner of Agriculture, or his representative, to examine and test it.

Any person testing milk where the test is used as a basis for payment must be licensed by the state, and glassware used in making the test is required to be examined at Geneva to determine its accuracy.

Now, department officials do an excellent job so far as their limited finances and personnel permit, and what the department does helps a lot, but it is obvious that with hundreds of milk plants and thousands of dairymen in the state, an occasional check-up by an inadequate force of men cannot control the problem. In the method of checking, also, the state official tester checks only the *dealer's sample*. If the dealer is dishonest, can he be trusted to take and hold the sample in his possession? Recent research shows that tests vary, depending on place in vat from which the sample is taken.

When a dealer is caught red-handed, I understand that all that is usually done is to make him pay for the amount of losses that he has caused through his dishonest testing. The law provides heavy penalties, which should be applied.

The problem before the industry, and I repeat that this is a problem of the honest dealer as well as of the farmer, is to find what can be done further to insure honest butterfat tests.

Let's Get the Facts

The first step in any program is to get the facts, and the way to get the facts is to ask you dairymen some questions. Several of the farm bureaus have been wondering what to do to insure fair butterfat testing, because so many farmers complain to the county agents about it. As a result of a conference with some county agents and leaders in the farm bureau, I am

If there is the cheating in butterfat testing that many dairymen think exists, then it is not a problem of farmers alone but of the whole industry. It means that some dealers buy milk at too low a price, thus using unfair competition with honest dealers.

coming to you dairymen with a list of questions at the conclusion of this article, which I hope you will answer and return, with the understanding that your name will be held confidential in every way. We will be glad to hear from any and all dairymen in any northeastern state. If the questions do not cover your experience, write us a letter.

If this questionnaire shows that there is general and just complaint about butterfat testing, then possibly a program can be built and steps taken that will come nearer giving you a square deal. Here is the questionnaire. Fill it out, sign it, with the understanding that your name will not be used, and return it to E. R. Eastman, Department B, *American Agriculturist*, Ithaca, N. Y.:

My Experience with the Butterfat Test

1. In your opinion were there too wide variations in the butterfat test for your herd at the milk plant during 1938?
2. Did you make a complaint to the plant manager during 1938 about your herd test?
3. Was an adjustment made following your complaint?
4. What was the adjustment?
5. Do you belong to a Dairy Herd Improvement Association?
6. Do you think that membership in the association has affected the test at the milk plant?
7. Are you entirely satisfied with the present method of sampling and testing your milk?
8. Do you have any suggestions for changing the present system?

REMARKABLE RECORD OF TRACTOR SAVINGS

★ ★ ★

Made by Farmers Who Own
CASE Tractors 8 to 10 Years Old

★ ★ ★

"I have taken home my tractor after it was torn down and rebuilt during the tractor school held here by the Case dealer," writes Jas. A. Irmond. "I got this Model C in the spring of 1930 and have worked it an average of 75 days a

year at all types of drawbar and belt work. I was surprised, and so was the audience at the school, when we looked into the working parts of my tractor.

"The transmission and clutch parts were as good as new. The main and connecting rod bearings had never been adjusted, and this is the first time the sleeves and pistons were changed. Total repair costs for the eight years' work, including parts put in at the tear-down, have amounted to only \$47.50. I believe my tractor is now as good as when I got it, and I see why they say Case tractor life begins at ten."

At ten hours per day, Mr. Irmond's tractor has worked 6000 hours with upkeep of only four-fifths of a cent an hour. Similar experience is reported by Anderson Bros., who have run their Case Model L 10,000 hours.

"Except for one year when we used a still cheaper fuel, it has always burned

distillate," they say. "It is now going into its tenth year of unflinching performance, always pulling a heavy load, and as far as wear is concerned it will run another ten years with very few repairs." Not counting the wheel lugs it has worn out, the Anderson tractor has cost a little less than one cent an hour for upkeep.

Hundreds of tractors 8 to 10 years old have been traced and their records reported. It brings out some amazing facts that have been boiled down into a little book. If you want to know the secrets of farm power at only 1 1/4 cents an hour for tractor upkeep you want this book. If you want facts, proved by 6026 years of tractor experience, about results with low-cost and other fuels, here they are. Just say on a postal card that you want "The Facts in the Case," and send it to J. I. Case Co., Dept. B-6, Racine, Wis.

DOWN They Go!

By ED. W. MITCHELL

I MET a friend one day who was very much upset and angry because a lazy tenant had chopped up and burned all of those parts of the house and barn he could safely remove, rather than go out and chop ordinary fire wood. He could not go to Florida like the boss, but he had no intention of going out in the cold either.

Ed. W. Mitchell

When I look at my own orchard, and some others I see along the road, it looks as though the apple men are too lazy to go to the woods for firewood and are cutting the trees nearest home for fuel. It almost makes me ill to see the grand old Greenings and Baldwins

laid low, that I have pruned, picked, sprayed and nursed like babies for the last quarter century.

They were husky youngsters when I got the farm, and have served to the best of their ability, but that is not good enough. Gradually the Ben Davis, Kings, Fall Pippins, Hubbardston, Seeknofurther, Spitz, and a dozen other good sorts have had to face the cost accounts, and have been found wanting. Now the Baldwins and Greenings are on the mat, and they have got to be good to get by. Any that show winter injury, or weakness of any sort, are due to go up the chimney in the near future.

I have just been reading some of the figures on labor income they get out for us up at Cornell, and some costs of production and returns from various sources that are reliable, and they strengthen my courage to use the axe. I know how much I have to spend on those trees every year, but I never know how much I am going to get back. If they are there I will bust a button to take care of them, and then wonder at the end of the season why I did it. It takes more strength of character to neglect them than it does to cut them down, and that is a tough enough test to suit me.

From the number of orchards I see being cut down this winter, I judge that a lot of other growers keep accounts, and are becoming convinced that our only chance to make money is with young, thrifty trees of desirable varieties. We are going to have to renew orchards more frequently than they did in the past, and our rotation will be nearer 25-35 years than the 45-60 that was the boast of western New York.

That bad winter of 1934-35 was a hard pill for the apple growers to swallow, but in the long run it may be

their salvation. It has certainly cleared out a lot of old trees of poor sorts, and forced growers to be as thrifty and efficient as possible.

If my guess is right, we face a big crop in '39 and probably low prices. In addition the competition from citrus and other fruits and vegetables for the consumer's dollar is going to be more intense. We might as well join the proponents of preparedness and get armed for a long, tough fight. We do not want to be handicapped by boarder trees that can not pay their way. So I read another page from Van Hart or Gad Scoville, go out and blaze a few more trees, and then go away where I can not witness the slaughter.

It seems to be a recurring surprise to us apple growers that the public do not want poor apples, even when apples are scarce. I think we fuss and work so hard producing them, that we come to look upon them almost like people do their children, as very valuable, and apt to be kidnapped at the first opportunity. As a matter of fact, I never heard of any one stealing a child because they wanted the child, they want a reward. I sometimes think apples are taken, not because people want them but because they want to get rid of the peddler or clean up the surplus.

Whatever the reason, I am firmly convinced they will not take many apples unless the growers get together and advertise and push them in much the same way the orange and pineapple and other growers push the sale of their products. Everything else, nowadays, is sold by intensive sales promotion and I see no good reason why apples should be an exception. We might as well add an item for advertising in our budget along with other necessary expenses. No use raising anything you can not sell, and sell at a profit, and I think a good slogan for many of us would be; start with the axe, and finish with an ad.

"He wants to be a sky-writer!"

4,000 LBS. MORE MILK A MONTH FROM 20 COWS

My C. T. A. records show my cows averaging 200 lbs. more milk per head October, 1938, over October, 1937. *New Cow Chow* did it.

JAMES M. KNIGHT
Homestead Farms, Stormville, N. Y.

"WE'RE GETTING *More Milk* ON THE *New COW CHOW*"

LOOK OVER the actual records of these dairymen. They got more milk by doing just one thing — putting their cows on *New Cow Chow*. They had been feeding many different kinds of rations — from old Cow Chow to feeds they mixed themselves. But every one of these men increased production on *New Cow Chow* — whether he fed a com-

plete Chow or a *supplement* Chow with his grain. *New Cow Chows* are making more milk because they're rebuilt on the new Milk-Making Therm principle. They require less energy for digestion, leaving more net food value for milk making. Try one of the *New Cow Chows* — straight or mixed with your grain. See the milk it makes — in just a few weeks.

3,600 Lbs. More a Month — 15 Cows

My official test cows showed me the difference *New Cow Chow* makes. They were going strong on Old Cow Chow but in 2 months stepped up 8 lbs. a day on M. M. T. Cow Chow.

EARL GOUBEAUD
Jonabell Farm, Sewickley, Pa.

2,550 Lbs. More a Month — 21 Cows

... Was feeding a good balanced ration, but it didn't take long for our cows to come up 2,550 lbs. a month when we started mixing *New Cow Chow* with our grain.

AMMON B. HOFFMAN
Barto, Pa.

420 Gals. More a Month — 40 Cows

I started feeding *New 24%* Cow Chow on Aug. 6. In less than 100 days production was up 14 gals. a day.

I Want
I WANT
I WANT

What Do I Really Want?

A YOUNG MAN came to me not long ago and talked frankly about his problems.

"Why don't I get along faster? I am intelligent, willing to work, and ambitious," he said, "but I am not getting ahead."

Then, growing more confidential, he told me he would like to get married.

"Let's analyze your wants," I said. "You want to get ahead and you want to get married."

I noticed he looked a bit tired and underweight. I began asking him some direct questions.

"How much sleep are you getting?"

He answered rather sheepishly, "Not enough, I suspect. My girl friend and I like to go to the movies, and we play bridge a couple of nights a week. We have a lot of friends who invite us to parties, and we are very fond of dancing. To be honest, we don't get enough sleep."

"Well, the first thing I would advise," I said, "for any ambitious fellow and his girl, would be plenty of sleep. Why not set yourself a rigid rule of eight hours sleep a night?"

He did some mental figuring. He realized what a drastic change this would mean in his bedtime.

"I couldn't do that," he said frankly.

That young man wanted pleasure more than he wanted advancement. He paid for pleasure, but was it worth the price for the long pull? He thought he wanted to get ahead and get married, but his program indicated that he wanted his fun a lot more.

♦ ♦ ♦ ♦

IF I WERE TO PROPHECY your growth in the year ahead, I would say: "First tell me what you want." One of the first things most people want in life is security — the assurance that they will have enough to pay the bills, educate the children, and lay aside something for old age. But many forget that the greatest security of all is good health.

In my next column I am going to discuss with you how you might get good health and security, rather than poor health and insecurity.

If you will send me a 3¢ stamp, I'll mail to you my 12-page pamphlet, "WHAT DO I REALLY WANT IN THE YEAR AHEAD?" It will DARE you to be a Bigger Self.

Suited to YOUR CROPS YOUR SOIL YOUR CLIMATE

CHILEAN NITRATE is the only natural nitrate. It is guaranteed 16% nitrogen. And it also contains, in natural blend, small quantities of other plant food elements.

Many of these elements such as iodine, boron, calcium, zinc, copper, iron, manganese and magnesium, in addition to phosphorus, nitrogen and potassium, are necessary to plant life for normal good health, growth, quality and yield.

Therefore, Natural Chilean Nitrate is agriculturally valuable both as a source of nitrate nitrogen, and to furnish, or build up a reserve of other plant food elements naturally blended with it.

Use Natural Chilean Nitrate—take advantage of its quick-acting nitrogen and its many protective elements. It is well-suited to your crops, your soil and your climate.

Short Winters

By Romeyn Berry

THE CHIEF complaint we have against these modern winters is that they aren't long enough anymore. They lack powers of endurance; they have no staying qualities. And that's a pretty serious matter because the winter is the only time a farmer has to get ahead in. From the first of April on, the best he can hope for is to keep from getting behind.

According to the best authorities, the farm winter used to hang on quite a long while in the old days. Sometimes it became a pretty tedious and dreary siege. But it gave the family ample opportunity to get in the wood, trap fur, fill the ice house, get out fence posts, boil sap, manufacture wooden articles, and attend singing school. It isn't that way nowadays—not up our road anyway. Nowadays it seems to become the first of April just the time it stops being Christmas, and you have to get out and work on the fences before you've half completed the list of jobs you'd jotted down for winter accomplishment.

Take this winter for example: we had a list of things that were going to get done (on top of the routine things, of course) which included building an addition to the chicken house, cleaning out the last quarter mile of hedgerow, giving the floors in the house a coat of paint, cutting down some old apple trees which had outlived their usefulness, and putting drinking bowls in the cow barn. But here it is the middle of February and we've no more than ordered the floor paint and made a start in the apple trees and hedgerow. There is still some time left, to be sure, before Elmer and I have to get out and work on the fences, but I am becoming uncomfortably aware that our next winter's list of things to do is going to bear a striking similarity to our this winter's list of things to do.

My wife and I were talking this matter over the other night (she's pretty far behind, too, on the things she meant to do this winter), and we decided it was the school bus that was to blame. It was the school bus, she thought, that was changing our winters and making them too short for substantial accomplishment. Fifty years ago, she pointed out, a good big snowfall acted on our road just like putting a cork in a bottle. Every time it snowed heavily, the folks up our road were corked in for days and sometimes weeks. You might be able to get down to the store if you actually had to go, and the children could flounder to school after someone had broken a path, but generally speaking it was easier to stay home and get things done around the farm than it was to dig yourself down our road and out to the main highway.

But the school bus has changed all that, she thinks. Ever since the school bus started running up our road, the winters have been noticeably shorter, the snow storms lighter and more infrequent, and it's been years since one could not get into town any time he wanted to go, provided he was willing to shovel out between the barn and the road.

You might think, on the basis of superficial observation and lazy reasoning, that our climate was moderating, but it's probably the true explanation that ever since the school bus started running, the town has not let our road get corked up any more. The minute it starts to snow, the town trucks and plows are out and at it. And in the morning, after the most old-fashioned snowfalls, there lies the path open to education and enlightenment. Incidentally, it is also open to town, and lots of winter mornings it's easier for me, my wife says, to think of things to go to town for than to think of hoofing it down to the back pasture and chopping away at the hedgerow.

There's a good, level foot of packed snow over our wheat at this moment, and there's a snow-drift at the corner of the barn that the blizzard of 1888 would not have been ashamed of, but the road to town is cleaned off down to the tar, and it's been that way right along.

No sir! Our climate has changed only to the extent that the school bus and the town superintendent have changed it, and those two are really responsible for our being so far behind with our winter work. That thought is comforting to an inherited Presbyterian conscience!

Tuesdays and Fridays somebody has to go in with the eggs, the cream, and the dressed poultry. Mondays and Thursdays I have to go in and try to sell editors pieces about farming. And there is scarcely a week that there isn't some pressing need on Wednesdays and Saturdays for something that somebody has to go to town for.

It's true that the trip to town doesn't take very long, and one can always get home in time for dinner, but how far along does any farm job get when it isn't started until after dinner? I doubt if Columbus would ever have gotten out of sight of land—let alone discover America—if he had waited until after—

(Continued on Page 22)

"Of all the snoopy people! I just heard Mrs. Jones tell Susie Smith she was listening and heard everything I said about her!"

Garden Gossip

By PAUL WORK

FOR a number of years, payments have been available to vegetable growers from the Agricultural Adjustment Administration in return for observing soil building practices under the agricultural conservation program.

For 1939, an allotment system providing benefit payments and deductions in connection with production of potatoes and truck crops or vegetables comes into effect. No brief statement can be strictly accurate about the terms of this system. Those who are interested should get in touch with the County Agricultural Agent to know just how it applies to a particular farm.

Paul Work

Under the new plan which does not supersede the Agricultural Conservation Plan but runs parallel to it, acreage allotments are assigned by states, counties and farms in areas which are designated as "commercial potato producing areas" or "commercial vegetable producing areas." Neither potato growers nor vegetable growers with less than three acres are involved. Peas and sweet corn for canning are not included. Allotments are based on areas planted in 1936 and 1937.

A farm which does not exceed the acreage allotment, is entitled to payments of three cents per bushel of the normal yield per acre of potatoes for the acreage in the allotment. With commercial vegetables, the payment is \$1.50 for each acre in the allotment.

When a farm exceeds the allotted acreage of potatoes, payment is subject to a deduction of 30 cents per bushel of the normal yield of the farm for each acre planted in excess. For commercial vegetables, there is a deduction of \$20.00 per acre for excess acreage. There has been no material change in the plan and payments for soil building practices.

The system of allotment is entirely voluntary as far as the farmer is concerned. It is also apparent that the Agricultural Adjustment Administration is anxious to have and is actively seeking the counsel of commercial vegetable and potato growers in the framing and carrying forward of plans. The difficulties of the allotment system are baffling enough. It behooves growers to acquaint themselves with

the plan and its operation and to make their views known as to future developments.

* * *

More New Varieties

Better Peppers

Growers for years have been asking for a pepper as excellent as California Wonder but earlier and more prolific. Last year's trials showed strains that represent a distinct advance in this respect not only in the Cornell trials but elsewhere. Among these are OAKVIEW WONDER, CALWONDER and HARRIS WONDER. WALTHAM BEAUTY and WINDSOR A continue to show up well.

Muskmelons

The Northeast is getting interested in muskmelons smaller than Benders and more uniform as to size. The last two or three years have seen the introduction of a number of varieties or strains which are not strictly alike and yet which have points enough in common to make a group name desirable. One of the first of these to appear was Golden Marvel and the name "MARVEL GROUP" is suggested. Among the names that appear are GOLDEN MARVEL, MARVEL, PRIDE OF WISCONSIN, WAYSIDE MARKET, MARKET KING, PHILADELPHIA SPECIAL, ABBOTT & COBB and JERSEY GOLD. The vines of all are vigorous and persistent through the season. The melons vary somewhat in size among the strains but within a strain are reasonably uniform. They are somewhat elliptical in form, distinctly but not very closely netted with a gray-green ground color. The flesh is very thick, orange in color, juicy and of high quality. They bear some resemblance to Honey Rock or Sugar Rock but most of them are a little more elongated and a little larger. The Marvels and Wayside Market are larger than the others. In our trial, these melons came in with Bender. Some catalogues report them earlier and some later.

New Lettuces

IMPERIAL 44, a new strain of the Iceberg type of lettuce, was mentioned a year ago as heading up better than most strains during summer weather. There is, as yet, no lettuce that is a really safe bet for mid-summer but trials and publicity have created so heavy a demand for Imperial 44 that most of the seed houses are sold out.

IMPERIAL 847 is also attracting a good deal of attention. COSBERG represents the progeny of a cross between Cos and old Iceberg. It seems well suited for upland, making rather small but very firm and heavy heads.

* * *

New Vegetable Book

"The Vegetable Growing Business" is a new book by R. L. Watts, recently retired as Dean of Agriculture at Penn State, and his son Gilbert S. Watts, successful commercial grower in Central Pennsylvania.

The new book is distinctive and rather remarkable in the fact that it is built on successful commercial experiences of both writers and yet takes full account of the vast volume of research findings that have become available during the past decade or two.

This is a fine book for anyone interested in vegetables to possess and read. It is clear cut, concise and interesting as well as smooth reading. The publisher is Orange-Judd, price \$3.50.

"Go to GRASS"

IF YOU WANT GOOD LOW-COST FEED for GRAZING or SILAGE

TREAT GRASS AS A CASH CROP and it responds like a cash crop. Well-fertilized grass often yields two to three times as much good, green, high-protein feed. Top-dressing grass real early with 200 pounds of Sulphate of Ammonia per acre not only produces more green weight, but also extends your grazing season 10 to 15 days at the time you need feed most.

The extra grass that Sulphate of Ammonia produces can be mowed in the early bloom stage and ensiled with molasses or phosphoric acid. You are inde-

pendent of the weather with high-protein grass silage to feed during the summer dry spell.

More of the milk check is yours when you pay a small fertilizer bill instead of a big feed bill. Domestic SULPHATE OF AMMONIA, on sale by your fertilizer man, is low in cost and rich in nitrogen, the element that makes grass grow. It contains 20.5% nitrogen — all soluble, all available. You give growth to your grass when you give it 200 pounds of Domestic SULPHATE OF AMMONIA per acre. Remember to get it on early, before growth starts.

for **FRUIT** Domestic SULPHATE OF AMMONIA, applied to fruit trees, strengthens the bloom, betters the set and increases the yield.

for **GRAIN** Domestic SULPHATE OF AMMONIA, at 100 pounds per acre applied early on winter wheat, usually adds 6 to 7 bushels per acre to the yield.

1939 CATALOGUE now ready

BRING ON Your Questions!

By H. L. COSLINE

THE ORIGINAL American Forum centered around the old chunk stove and the cracker barrel in the country store. Here on an evening, after the chores were done, the men gathered to discuss politics, weather, and the state of the country. Automobiles and good roads thinned out the ranks of cross-road stores, and with them went a meeting place where farmers could swap ideas.

About a year and a half ago, Tom Carman and James Holman, enterprising feed dealers of Trumansburg, became enthusiastic boosters for a poultry forum. They talked the idea continually, and finally, with the cooperation of a few poultrymen, decided to go ahead. It was decided to make it a tri-county forum, with members from Seneca, Schuyler, and Tompkins counties. Since that time, attendance has never been below 50, and has been as high as 150.

The January meeting this year was held in the church at Perry City, where for the modest sum of 50c the ladies of the church supplied a supper that would have done credit to any hotel. This may not be an essential part of the forum, but it is popular with this group.

I suspect that no rigid rules can be laid down that will guarantee a successful forum, but from what I heard in Perry City, I judge the following to be worth some thought:

1. **MAKE SOME PLANS.** As the name indicates, a forum is marked by the absence of speeches. There are questions and discussions on the part of all. Under ideal conditions, a forum might just naturally develop into a valuable session, but there is always grave danger that the discussion may get side-tracked unless plans have been made to guide it. In the Tri-County Forum, individual remarks are limited to three minutes.

2. **STICK TO ONE SUBJECT.** This rule is open to argument, but the selection of a topic keeps the discussion timely and allows for thoroughness and the reaching of some definite conclusion. However, the chief reason for selecting one subject and sticking to it involves the 3rd rule which is—

3. **HAVE AN AUTHORITY ON HAND.** It is obvious that it is impractical to have a half dozen authorities, but it is comparatively easy to have one who can qualify if you limit the

discussion to one subject. At Perry City, parasites were in the defendant's box, and the man who supplied many of the facts was Dr. Levine of Cornell. As an interested observer, I was certain that much of the value of the discussion would have been lost without the presence of a man who knew the available facts about common poultry parasites.

4. **KEEP ON SCHEDULE.** The invitation read, "Supper at 7:00 sharp" and there was no delay. The custom is to close the discussion promptly at 10:00. Not everyone went home immediately, but some, especially those who had driven some distance, did. Of course, if the majority had wished it, the closing time could have been at 11:00, or even at 2:00 in the morning, but it is important both to start and to stop the regular discussion promptly at the hour agreed upon.

5. **BE ADAPTABLE.** Some forums like to have a speaker to start the discussion. That has its advantages, and the decision should be up to the members. A fine example of adaptability is the Tri-County Forum. Probably confining the group to one county would have made the number too small. The area to be included is worth some study. Likewise, it would be admirable but unwise for a poultry enthusiast to start a poultry forum in an area where there are too few poultrymen to make a sizeable group. In some areas a dairy forum would work out better, or it might be sheep, vegetables, fruit, or whatever appears to be of the greatest interest to the greatest number.

One incident at Perry City gave convincing testimony of the value of the forum. Said one man:

"Some time ago at Forum, we discussed diseases, and the necessity of getting an accurate, quick diagnosis was emphasized. The very next day some of my hens were sneezing. I took them to a laboratory, where the trouble was diagnosed as laryngotracheitis. I sent that day for some vaccine. Even so, by the time it arrived and we had vaccinated the flock, the trouble had spread to a large proportion of one pen. We stopped it, and the birds in other pens were not affected. My attendance at Forum that time saved me a lot of money."

There is nothing new about forums. It is just a matter of adapting the old country store idea to modern conditions. Start one in your community.

Here is the committee that arranges the programs for the Tri-County Poultry Forum. From left to right the men are: back row, Howard Thompson, Interlaken, N. Y.; Mr. Vorhees, Lodi, N. Y.; James Holman, Trumansburg; front row, Raymond Arthur, Odessa, N. Y.; James Rice, Trumansburg, N. Y.

The land where this house stands was bought by John Jacob Ehle in 1733. This house, built in 1827, is now home to the seventh generation of John's descendants. Built of native stone, it stands as square and true as 100 years ago. The farm produces milk for New York.

Land that makes Men Free

THE MOHAWK VALLEY had known three flags—Dutch, French, and British—by the time John Jacob Ehle arrived. By the Queen's consent he came to preach the gospel to the Indians. The year was 1727. He came to a land where white men fought white men for control of a vast new continent. Indians, with torch and tomahawk, sought to stop the westward march of settlers.

Just west of where Palatine Bridge now stands, John Ehle built a small stone house on the north bank of the Mohawk. When it was done he bought 300 acres in a strip straight up from the river. White neighbors were few and far between, but most of them spoke John's High Dutch. They were Palatines. In search of equality and freedom they had dared a wild new world.

The Palatines prospered with hard work and good farming. Rich bottom land and fertile slopes soon grew wheat and barley for down-river towns from Schenectady to New York. John Ehle grew old in the valley and his sons had sons of their own.

* * *

Then came 1776, and with it war news from New England. The colonies had declared for independence. Some Palatine lads shouldered muskets to join the far-off struggle, but most stayed home to tend the crops and clear more land for next season. Wheat to feed the army brought a good price, and Mohawk Valley barns were a granary for the country.

But war came closer—into the Mohawk

Valley marched Colonel St. Leger in the summer of '77. Just 30 miles west of Herkimer his forces attacked Fort Stanwix. To arms! Every man from 16 to 60. Father and son, brother and cousin, they counted 800 defenders. St. Leger mustered 2000.

On this site was a Dutch Reformed Church where John Jacob Ehle preached when he first came to the Mohawk Valley. The present structure was built in 1767, was stockaded in 1776 and became the famous Fort Herkimer. It stands on the south bank of the river just below the town of Mohawk.

today for John's great-great-great-great-grandson. In 1939 the same strip of land is still home to the eighth generation.

* * *

Two hundred years have brought great change to Mohawk Valley farming. The first hundred saw rich profits from crops of wheat and barley. Heavy freight wagons and wide-bottomed scows plied back and forth past Ehle's front door. Then came the Erie Canal in 1825, and in 1836 the railroad. With them the grain trade moved westward. Mohawk fields became pasture for cows; butter and cheese became the main crops.

About 1850 came hops and broom corn, and joyful days of prosperity. But change follows change and those crops moved on. Mohawk Valley cheese became world famous and Little Falls prices became standard

for the country. But still more change, and now the big dairy barns up and down the valley produce milk that goes to market in insulated tanks.

* * *

Like many sections of the Northeast, the Ehle farm is not easy to work. But the lessons of time have shown how to keep this farm productive. Its pasture and hay are better. Its alfalfa feeds 65 head, including 40 cows that make milk for the city. The place today is free and clear.

Time and again this farm paid for itself as new generations took over. Three times in two centuries it paid for sturdy new homes. In its eight generations, this land and this home boast scientists, students, and soldiers. This is the land that men fought and died for. This is the land that makes men free.

This is one of a series of articles published as

*An Expression of Confidence
in Northeastern Agriculture*

* * *

About half the farms of the Northeast are owned free and clear. They have earned their independence. The others are mortgaged; and the greatest risk to their owners is the chance of losing what progress they have made.

For some 30,000 farmers of New England, New York, and New Jersey, the Federal Land Bank is providing a type of mortgage financing that gives the greatest degree of safety.

"Safe Financing" is the name of a folder that describes these farm mortgages in detail. You may have a copy. It is free for the asking.

THE FEDERAL LAND BANK
OF SPRINGFIELD

SPRINGFIELD, MASSACHUSETTS

The Northeast is a Good Place to Live

INCREASED profits in dairy farming result from a pasture fertilization and management program which increases yields of high-protein grasses and clovers, lengthens the grazing period, and reduces barn feeding costs.

Potash, phosphorus, and calcium are lacking in most pasture soils, and must be supplied before much response can be expected from nitrogen. Fertilizer analyses in the 1:1:1 and 1:2:2 ratios, applied in amounts to supply 25-50 lbs. of nitrogen and 50 lbs. each of phosphoric acid and potash, are recommended.

Consult your county agent or experiment station regarding the plant-food needs of your soils. See your fertilizer dealer or manufacturer. You will be surprised how little it costs to include the right amount of potash in your pasture fertilizers.

Write us for our booklet "The Cow and Her Pasture."

INVESTMENT BUILDING WASHINGTON, D. C.

Sales Service

Livestock breeders who are subscribers of A.A. have a special and distinctive sales service at their command, NORTHEAST MARKETS FOR NORTHEAST PRODUCERS. It is made available to readers of A.A. in an effort to open markets for surplus that otherwise may have to be sacrificed. For details and rates, write the Advertising Dept. of American Agriculturist, Savings Bank Bldg., Ithaca, N. Y.

TROUBLE?

Chapped, cracked Teats have upset many a dairyman at milking time. Use Corona Wool Fat regularly. Quickly helps heal, soften and soothe and keep Teats and Udders soft and pliable. Furnishes oil to lubricate the skin. Inhibits germ growth. It is the dairyman's friend!

FAMOUS DAIRYMAN PRAISES CORONA

"The best Teat salve I ever used!" says Mark Keeney of Overbrook Farm. The beneficial effects of Wool Fat are well-known. Use CORONA on cows, horses and other livestock, and on your own hands. Ideal for chapping, minor wounds, scratches and bruises.

At dealers or direct postpaid. 8 oz. can 65c, 20 oz. special dairy size \$1.30.

FREE SAMPLE Use it and see for yourself! Write today!

Dairymen Say: Keep the ROGERS-ALLEN LAW

HUNDREDS of signed petitions and letters like those on this page are pouring into the offices of *American Agriculturist*. Only two letters out of all those that we are receiving express opposition to the Rogers-Allen Law. The rest emphatically request the Legislature not to repeal or modify it. But the anti-farm gang is at work, trying to show that farmers are not for this law. Therefore, if you wish the Rogers-Allen Law continued, and if you want a living price for your milk bad enough to fight for it, sign the petition on this page (if you have not already done so) and mail it at once to E. R. Eastman, Editor of *American Agriculturist*, Box 367, Ithaca, N. Y. These petitions will in turn be brought to the attention of the New York State Legislature. Now read the following letters from dairymen:

* * *

Would Have Been One Less Farmer

I HAVE WRITTEN my legislator and am enclosing my signed petition for continuance of the Rogers-Allen Law in its present form. I wish I could write one for all my neighbors, who just don't take the time or have some other reason. For my part, I surely don't want to go back to last summer's price. If I had to, there would be one less farmer here.

I am young, have been farming since 1935 when I bought a place next to Dad's, and with his tools and help I have accumulated a nice sized dairy; but if the price of milk had not improved just when it did, the Federal Land Bank would not have received their interest Jan. 1st.

If I take the price of milk which I received last winter and figure my losses from that for the summer, it would run a little over \$2,000, which means everything to a fellow trying to get started. I am hoping and praying that our legislators can see the farmers' side of the milk situation. If they don't, I feel that all the dairy farmers in the Northeast will be licked for ever, because many are in the same position as myself.—V. L., Akron, N. Y.

* * *

Grange Supports Rogers-Allen Law

AT A MEETING of the Mohawk Valley Grange on January 24, the following resolution was adopted:

RESOLVED, That the Mohawk Valley Grange go on record as favoring the retention of the Rogers-Allen Milk Law, and that a copy of this resolution be forwarded to *American Agriculturist*.

—Marion F. Persse,
Secretary, Fonda, N. Y.

EDITOR'S NOTE: At the annual meeting of the New York State Grange at Jamestown, Dec. 11-17, a most emphatic resolution was passed endorsing the Rogers-Allen Law, and asking the Legislature to leave it alone for at least two years so that it could be given a fair trial. Dozens of Subordinate Granges have passed similar resolutions.

* * *

Too Many Selfish Interests

IT SEEMS TO US that it is unfair to give so little time to this movement, since only a real test will give us opportunity to profit by it. We hope the Milk Pact will have a fair trial, and we want to thank you and the *Ameri-*

can Agriculturist for the effort you are making to help dairymen. We need that help.

There are too many selfish interests that would gladly tear down any united effort of the farmers. You may be interested to know that Lowville Grange last Saturday passed a resolution requesting that a fair trial be given the Rogers-Allen Law and the Milk Pact.—E. L. A., Lowville, N. Y.

* * *

Ayrshire Breeders Pass Resolutions

The following resolutions were passed by the Federation of New York Ayrshire Clubs and Breeders at their annual meeting in Syracuse, New York, on January 4th, 1939:

WHEREAS, New York State is primarily a dairy state, and

WHEREAS, the income from dairy products has been ruinously low, and

WHEREAS, The New York State Federation of Ayrshire Clubs and Breeders, representing the Ayrshire Breeders of New York State, meeting in Syracuse, New York, January 4th, 1939, worked for the passage of the Rogers-Allen Law which was designed to produce a living price for milk, and

WHEREAS, the Federal and State Milk Marketing Agreement is a natural outgrowth of the Law, and

WHEREAS, milk prices under this agreement have shown a marked improvement,

THEREFORE BE IT RESOLVED, That the New York State Federation of Ayrshire Breeders go on record as favoring the continuance and support of said Law until such time as it proves itself undesirable and unworkable.

BE IT FURTHER RESOLVED, That the attitude of farm paper called "The Rural New Yorker" toward the Rogers-Allen Law, Metropolitan Bargaining Agency and the Federal and state milk order has been detrimental to the best interests for the improvement of conditions of New York dairy farmers,

BE IT FURTHER RESOLVED, That copies of this resolution be sent to our U. S. Congressmen, State Senators and Assemblymen, and that they be urged to give it their full support.

Resolution Committee:

Ralph E. Lewis,
Nellis B. Bronner,
J. L. Atwood.

* * *

Dairymen's Salvation

LAST WEDNESDAY I attended a meeting of the Dairymen's League held in Warsaw, N. Y. If anyone thinks for one moment that the dairymen belonging to the League are not in favor of the Rogers-Allen Act, I wish they could have been present and seen the enthusiasm that was evident in behalf of its continuation. Our Grange Hall was nearly filled with League members and visitors from at least three counties.

Everyone felt that this law is the dairyman's salvation.—G. M., Silver Springs, N. Y.

* * *

Let the Rogers-Allen Law Alone

AS A FARMER with more at stake in the milk business than the average, I would like to express my opinion. I know that if the farmers had not obtained the increased price paid after the Milk Marketing Agreement went into effect this fall, there would have been more unpaid taxes and mortgage foreclosures than there are.

(Continued on Page 15)

I most emphatically believe that the Rogers-Allen Law, the milk bargaining agencies, and the milk marketing agreement based on this law, should be given a fair trial, and respectfully request the legislature to leave the Rogers-Allen Law in its present form.

You Want a LIVING PRICE for Your Milk, Don't You?

YOU WANT...

- . . . fair treatment in the weighing, testing and delivery of YOUR milk.**
- . . . to hold profits to dealers to a fair basis!**
- . . . the consumer to have the best milk possible!**

THEN YOU WANT the very same things for which the Dairymen's League has been fighting for 20 years!

Think of these things as you sit by your fireside tonight. Ask yourself this simple question: "If the Dairymen's League has been fighting for the very things I want, then isn't the Dairymen's League actually fighting for me?"

Of course, it is. For the aims of the Dairymen's League touch the heart of every dairy farm home in this milk shed. *A living price for milk plus fair and honest treatment* mean higher standards of living for all of us . . . for every man, woman and child who lives on a farm.

There can be no difference among farmers in wanting these things. There may be honest differences as to how to get them. But once we all see clearly that *we want the same things*, then we are beginning to march shoulder to shoulder in our fight to make the things we want come true.

We are beginning to see the Way

During the past few years another very important understanding has been growing up among us. We are learning that WE, the farmers of this milk shed, **MUST DO THE JOB OURSELVES**. We have learned that we cannot depend upon dealers to give us these things which mean happiness for our families. We have learned that we cannot depend upon laws, however well they are meant. All but a handful of the farmers of this milk shed now realize that only by co-operative effort

can we gain our just rights. All are beginning to agree that collectively we have the strength to demand what our families deserve. All of us are learning the power of true co-operation.

Proud of the Part We've Played

We thousands of farmers in the Dairymen's League are proud of the part we have played in the last twenty years. We have been at the front of this fight taking all the abuse. We have been the victims of lies and propaganda; the one group at which all of the fire of the farmer's enemies has been directed. But during that time we have proved many things which are now being recognized by more and more farmers every day.

We have proved that only by working together can farmers put their own price tag on their own milk.

We have proved that farmers can and will work together for the common good.

We have proved that farmers can manage their own affairs.

And now that we all have come so far, let's fight to hold what we have achieved. Let's oppose all effort to pit farmer against farmer from whatever source it may come. Let's **all** know our TRUE as well as our FALSE friends.

Dr. Naylor Dilators are sterilized, medicated and saturated with the antiseptic ointment in which they are packed. They have a deep yielding surface of soft absorbent texture which fits either large or small teats without overstretching or tearing and which carries the medication INTO teat canal to seat of trouble.

The Only Soft Surface Dilators

Easy to Insert—Stay in the Teat

Whether infection at end of teat, cut or bruised, the resulting condition which closes teat canal making it hard to milk is always the same—INFLAMMATION.

To relieve inflammation in a wound or bruise the treatment most universally used by the veterinary and medical profession is—to apply antiseptics, healing agents and a sterilized, soft absorbent dressing.

Dr. Naylor's Medicated Teat Dilators apply this same treatment for removing inflammation from the milk canal of cows' teats. They carry antiseptics and healing agents into teat canal to combat infection and promote healing. The dilators themselves are sterilized, soft, absorbent dressings which protect the inflamed area, absorb inflammatory exudates and keep teat canal open in its natural shape while tissues heal.

Sterilized, Medicated—Packed in Antiseptic Ointment Large Pkg. (48 Dilators) \$1.00 Trial Pkg. (18 Dilators) .50

DOWN THE

By J. F. "DOC" ROBERTS

I HOPE the sketches on this page will help you to better "know your sheep", particularly since the value of sheep is determined to a large extent, by their age.

No. 1. LAMB'S TEETH are small, thin, shelly and usually a little curved from the center to right and left, but

firmness in the jaw, and the shrinking of the gum. Remember continually that as age advances, the teeth are constantly wearing narrower.

* * *

Horse ages can be told in the same general way by stepping up the entire classification a year, but for the average man who is not buying a colt or a young horse, the width of the tooth at its base, as it comes out of the gum, is the important thing. The narrower the tooth at that point, the older the horse, and the reason this is important in horses is because long teeth can be cut off, cups can be burnt into grinding surfaces, etc., but the base of the tooth cannot be "monkeyed with".

* * *

The importation of live cattle for slaughter is over for this quarter. The quota has been reached in the new Trade Agreement, and from now until April 1st, no more cattle can be brought in except on the old \$3 per hundred basis, which is prohibitive. This ought to "buoy up" our cattle market, particularly when you realize that we had 66 carloads of Canadian cattle on our market this week Monday. Nevertheless, don't forget that April 1st another quota starts for the next quarter.

* * *

Right now, look out for pregnancy disease in your ewes. Ewes heavy with lamb, two to four weeks before lambing time, will hang back, may stagger, some will go blind, may grind their teeth, and as the disease progresses, will lie down and be unable to get up. This is really a carbohydrate deficiency. During this period, if you will feed your ewes daily from one-half to one pound of grain, or molasses, per head, you have then, the practical preventative for this disease, which is taking more and more of our Northeast ewes each year, particularly the old and thinner ewes.

* * *

Livestock of all classes has done more for the producer this year of low priced farm products generally, than for a good many years, but did you know that farm income is influenced more by its livestock than by any other one thing?

ANNUAL WEAR

can be told from stubs of old teeth, which are blunt, and come from a shrunken gum.

No. 2. YEARLING TEETH show two large, central, permanent teeth. They show at 18 months in about 85% of all sheep; the balance at this age, will still show lamb mouth.

No. 3. TWO-YEAR OLD TEETH show four large, permanent teeth, but at 30 months of age, only about 40% will still show this mouth, and the balance will show a three-year old mouth.

No. 4. THREE-YEAR OLD TEETH show three pairs of large, permanent teeth, but at 42 months, over half of all three-year olds, will show a four-year old mouth, and a four-year old has four pair of permanent teeth, but over half of the three and all the four-year old will look alike.

No. 5. Beyond the age of four years, it is necessary to judge age by the width of the teeth, their wear, their

Dairymen Say: Keep the Rogers-Allen Law

(Continued from Page 12)

And if the farmers can continue to get somewhere near their share of the consumer's dollar this year, the greater return will mean a more secure agriculture and enable farmers to begin buying the many things now greatly needed.

I would suggest that until the *anti-everything gang* can give us a better and more workable law, they had better let the Rogers-Allen Law alone.

—F. E. F., Wellsville, N. Y.

Gets His Goat

PLEASE DON'T let a few noisy fellows make you believe that all farmers are against the Rogers-Allen Law, nor are all of those belonging to the Dairy Farmers Union against it either. I am a Union member, but I voted for control and I was not the only one by a long shot.

We had the right to set our price last summer and I have not forgotten it yet. South New Berlin members (local cooperative) were selling sometimes for as low as 75c a hundred (return to farmers).

Why should not the majority rule? If the farmers don't want control later, they can vote it out if I understand right. And why should a Consumers Committee from New York City try to make us believe they are representing the farmers?

Last summer we were all bidding against each other until milk was sold for next to nothing, but I did not see the Consumers' Committee worry about the farmer then.

I've tried to put my view on paper (it gets my goat so I don't know as I can think straight) but it looks to me as if we will not get anything for our milk as long as some people stir up strife. My son thinks the same way.

—A. W., Smyrna, N. Y.

Milk Order Has Helped Them

WE ARE certainly for the Rogers-Allen Law and the Bargaining Agency, and would like to have it enforced as it is now. It surely has done us a heap of good, and so has the Milk Marketing Agreement. It should have a fair trial.—(Signed): William Tamm, William Gerhardt, Arthur Lawyer, Olin Deering, Martin Deering, Aloinzo Wilson, Middleburg, N. Y.

Feels Encouraged

I AM PART OWNER in this business and I am so encouraged with our raise in the price of milk that I want to tell you we all desire to give this Rogers-Allen law a long, fair trial. We almost went into bankruptcy last year. I was about ready to give up. Now the prospect is a lot brighter. We have paid up some of our back bills and perhaps can catch up in our business if we can continue to get a price for our milk.

I say we are encouraged and don't let the anti-farm gang impress you folks that we want a change again. They have tried to keep the farmers fighting and divided long enough. They don't represent us people in this way and we want you to know it.

—Mrs. C. J. C., Adams Center, N. Y.

Farm Organizations Support Law

I AM ENCLOSING my signed petition for retention of the Rogers-Allen Law. You are to be commended for your stand and your untiring efforts in behalf of this law. I am proud to say that I am a member of three great farm organizations that support this law one hundred per cent—namely, the Grange, the Farm Bureau, and the Dairymen's League.—L. T. D., Madison, N. Y.

Buffalo Producers for the Law

I BELIEVE I can speak for a dozen producers of fluid milk for the Buffalo market in this locality who will do everything in their power to protect their own interests. Down with the anti-farm gang!—C. T. S., Cowlesville, N. Y.

WHY DISASTERS OCCUR DURING THE BARN-FED MONTHS

Cows that score good yields during warm weather and pasturage months often fail utterly soon after they come to barn. This would not seem strange if one could SEE the digestive and generative organs groaning under the strain of converting dry, rich feeds into milk during the long winter months. The merciless grind breeds disasters that steal upon you like a thief. Your profits from milk get winter-killed!

Feeding procedure should change with the weather. Instead of expecting physical functions to operate smoothly under unnatural strains, wise cow owners adopt the plan of giving KOW-KARE as a feed supplement. The medicinal herbs and roots and balanced quantities of Iron and Iodine are planned to promote vigor in the organs that must bear the severest strain. Instead of health going downhill and feed going to waste, the cow is being assisted to convert her diet into bumper milkings with minimum hazard to her future health.

Freshening calls for Special Aid

The calving ordeal, especially in winter or spring, finds a cow at her lowest ebb of resistance. Unaided, she is often the prey of disorders that lower or destroy her ability to drop healthy calves and maintain profitable production. Kow-Kare with the feed for a few weeks before, during and after her danger month will pay big dividends in maintained vigor and absence of disorders.

Kow-Kare is found at general stores, feed dealers and druggists. If ordered by mail, \$1.25 for large size, 65¢ for medium size will include postage.

NORTHEASTERN Slants ON THE National NEWS

America's "Frontiers" Unchanged

HORNETS' NEST was stirred up both here and abroad by recent report that President Roosevelt had said that America's frontier was now on the Rhine. When newspaper correspondents asked him about it point blank, President flatly denied remark, said "some boob got that one off", and that he would like to meet its author face to face.

Two other happenings previously added fat to fire. When a new-type bombing plane crashed in California recently, it was discovered that riding in it was a Frenchman, member of a French aviation mission. Investigation revealed that Army, Navy, and Treasury of United States, at President's order, were aiding France to buy airplanes in this country for rearmament. Later, secret conference was held between President and entire Senate Military Affairs committee. Immediately storm arose over President's "new" foreign policy.

Nine Republican members of House Foreign Affairs Committee signed statement criticizing alleged special facilities given to French air mission as tending to "entangle us in foreign conflicts and endanger the peace of America." Former President Herbert Hoover accused President Roosevelt of preparing the people for a new step that could only end in war. In both Senate and House, demands were made that Administration shed light on its foreign policy.

Following day, at press conference, President not only branded remark about frontiers in France as a lie, but declared that there is nothing new, nothing secret about American foreign policy, and outlined it as follows:

1. We are against any entangling alliances, obviously.
2. We are in favor of the maintenance of world trade for everybody—including ourselves.
3. We are in complete sympathy with any and every effort made to reduce or limit armaments.
4. As a nation—as American people—we are sympathetic with the peaceful maintenance of political, economic and social independence of all nations in the world.

In Washington, Assistant Secretary of War Johnson, commenting on both French and British orders for planes, said that since they were of a type that were not on U. S. restricted list, the orders were wholly a private matter.

Supreme Court Gives TVA Verdict

BY 5 TO 2 VOTE, Supreme Court rejected suit of fourteen private power companies to restrain Tennessee Valley Authority from competing with them. Justice Roberts, who delivered majority opinion, held that charters of these private companies do not free them from competition "either from individuals, other public utility corporations or the State or the municipality granting the franchise." Two other judges, Justices McReynolds and Justice Butler, disagreed with this view.

Latter declared that TVA program sought deliberately to sell power in "unlawful and destructive competition," and he called TVA yardstick rates "confiscatory."

Although Court did not rule on constitutionality of TVA, its rejection of private companies' suit is looked upon as TVA victory which will permit it to go ahead with its program of generating and distributing electric power. Private companies in area are reported ready to sell their properties to TVA, or to cities in which they are located, because they cannot compete with TVA rates.

TVA decision, it is believed, will have far-reaching effect upon American business, for it seems to open way for further government competition with private enterprise.

President Continues Relief Fight

AFTER signing emergency relief appropriation for 725 millions to carry WPA until July 1st, President Roosevelt lost no time in asking for more funds. Three days later, Congress got message demanding another 150 millions for WPA—same sum by which it cut President's original request for 875 millions.

Though bill permitted President to ask for more funds later, understanding was that this was only if a new emergency arose before July 1st. Congressional "economy bloc" is said to regard President's immediate request for more money just as a continuation of the fight.

Chairman Woodrum of House Appropriations subcommittee made following comment on President's message: "I don't know what action the committee will take, or whether it will take any. I don't see that the situation has changed, and I have not changed my view that the 725 millions we have already appropriated will be enough." Chairman Adams of Senate Appropriations subcommittee also said that neither the relief situation nor his own views as to what should be done had changed.

Amend Wagner Labor Act

"SURELY where there is so much smoke there's fire," says Charles R. Hook, Chairman of National Association of Manufacturers Board, in an article on Wagner Labor Act, recently published in United States News.

Mr. Hook points out that demand for amendment of Wagner Labor Act comes not only from employers, but also from a "large section of organized labor" and from the public. "The National Labor Relations Board," declares Mr. Hook, "should be the first to welcome congressional investigation of what is wrong with the Act, the first to suggest wherein the law could be improved. With dissatisfaction from so many varied sources, the need of impartial investigation certainly is established." National Labor Relations Board has opposed a congressional inquiry.

Mr. Hook advocates amending the act to correct its one-sided character, to make it impossible in the future for

the Labor Board to act as prosecutor, judge, and jury, and to do everything that Congress can do to guarantee impartial administration of it. If you are going to set up rules for a game, says Mr. Hook, they have to apply to both sides.

Last week, Representative Taber (New York Republican), senior minority member of House Appropriations Committee, proposed withholding funds from National Labor Relations Board until the Labor law could be amended so both industry and labor would be assured a square deal.

SLANT: Not only are labor and industry involved in this unfair Wagner Labor Act, but farmers are just as much concerned as anyone else. Agriculture is supposed to be exempt under the law, but in practice this exemption means nothing. Thousands of farmers and their organizations all over America are up in arms over this unfair Act, demanding that it be repealed or amended to give agriculture a fair deal. *American Agriculturist* is in receipt of thousands of signed petitions and letters, showing that northeast farmers are almost unanimous in their opposition to the Act as it is being administered by the Labor Relations Board. If you have not already expressed yourself on this important subject, write us a letter and it will be submitted with the other letters and petitions to Congress, asking for an amendment to the law to protect agriculture.

Less Farm Products Exported

MORE demand by foreign buyers for American industrial products and less demand for American farm products was 1938 foreign trade story, according to figures recently made public. Last year, purchases of American goods by foreign buyers were four-fifths as large as during boom year of 1929, but they lined up differently. In 1938, war goods were in heaviest demand.

Foreigners bought last year eight times as many airplanes and airplane parts as in 1929; six times as much scrap iron; nearly three times as much metal-working machinery; 20 per cent more semi-manufactured iron and steel; also, more fuel oil and copper. On other hand, they bought only quarter as much lard as in 1929; one-third less unmanufactured cotton; barely one-third as large a quantity of American meat products; and a third as large a volume of dairy products. America sold about as much wheat abroad last year as in 1929, but American taxpayers paid more than 20 cents a bushel to subsidize these wheat sales.

One reason for falling off in exports of farm products is said to be war scare which makes importing nations seek to become self-sufficient in food-stuffs. Another reason given is that foreign nations can afford to buy from United States only what they absolutely need because we buy less from them than we sell them. Economists point out that goods in foreign trade must be paid for in goods, services, or gold; that if United States buys less than she sells, then foreign buyers have to pay us the difference in gold; and that United States already possesses more than 60 per cent of world's mone-

tary gold, with many nations lacking large enough quantities of gold to pay for what they need. Result is they either don't buy from us or turn to barter type of trade favored by Germany, Italy, and Japan.

SLANT: A third reason for falling off in farm exports might be reciprocal trade treaties negotiated in past few years by Secretary Hull, which have certainly not always been to advantage of the farmer.

Mounting Cost of Farm Program

RECENT issue of the publication, *Business News*, publishes some interesting figures showing what government experiments in "helping the farmer" have cost in the past 10 years. In 1934, cost jumped from about 83½ millions to nearly 444 millions. Here are the figures from then on:

1935	\$1,035,170,286
1936	898,733,978
1937	1,017,943,003
1938	799,696,835
1939	1,248,060,200

Ten years ago, the entire agricultural appropriation (about 76½ millions) went to U. S. Department of Agriculture. In 1930 the Federal Farm Board came into the picture. In 1931, the Commodity Exchange Administration was added. In 1933, AAA appeared. Since then, the following programs have joined the farm family:

Removal of Surpluses.
Farm Security Administration.
Parity Payments, etc.
Commodity Credit Corporation (Ever Normal Granary).
Aid for Tenant Farmers.
Benefit Payments to Sugar Growers.
Electric Home and Farm Authority.
Rural Electrification Administration.
Farm Credit Administration.
Crop Insurance.
Direct Relief (by Department of Agriculture).

SLANT: With so much expert help from the government, it is strange that agriculture is still in the dumps—or is it strange?

Farm Credit News

Dr. Myers Receives Medal

"OUTSTANDING service to American agriculture" recently won for Dr. W. I. Myers, former governor of Farm Credit Administration, the Distinguished Service Medal of American Farm Bureau Federation. Award to Dr. Myers was in recognition of his splendid work as Farm Credit head, in directing refinancing of American agriculture from 1932 on down to 1938, when he resigned as governor to return to Cornell University to take the place of the late Dr. George F. Warren as head of Department of Agricultural Economics and Farm Management.

In announcing the award to Dr. Myers, American Farm Bureau Federation declared, "It is generally agreed that Dr. Myers did a magnificent piece of work in handling one of the most difficult jobs in the national administration."

SLANT: Farm people throughout the Northeast know and love Dr. Myers and are happy that he has received this recognition of his work as head of FCA.

Farm Loans in Good Shape

Loans totaling more than 210 millions were repaid during 1938 by farmers who are members of Production Credit Associations, according to recent report issued by Farm Credit Administration.

Production Credit system extends credit to farmers for periods ranging from four to six months to finance crops, and for periods of a year or more

to finance dairy cattle and range livestock. These associations have loaned a billion dollars to farmers since they were organized five years ago.

SLANT: In Northeastern states annual meetings of Production Credit Associations have been exceptionally well attended this winter by farmers, and enthusiasm for the Production Credit Service is wide spread.

Spanish War Draws to a Close

AS WE GO to press, end of Spanish Civil War is at hand. Since capture of Barcelona by Spanish Rebels, events have moved swiftly in Spain. More than 130,000 Spanish refugees fled before General Franco's advancing army and crossed the border into France. On arrival there, soldiers were disarmed and almost all of them sent to internment camps to be fed and held in safe keeping until their future is arranged for. Women and children among the refugees were distributed in homes throughout France.

One war correspondent who witnessed escape of Loyalists into France described it as a "strange parade", and said that good humor of crowd was remarkable. Some refugees, he wrote, hung on desperately to a few of their possessions. One peasant drove his five black goats along. Some women struggled on in high-heeled shoes and fashionable clothes, covered with dust. Wounded soldiers hobbled along as best they could, one fellow on crutches having taken off his artificial leg and slung it over his shoulders. Twenty-three Americans were said to be among the crowd.

Besides unending stream of human beings, there were horses, cars, trucks, artillery, and herds of cattle.

First reports that defeated Loyalists would surrender were denied when Spanish Rebels held out for "unconditional surrender." However, latest news as we go to press is that peace moves are under way and that the end of the war is matter of a few days.

Britain and France are reported ready to recognize victorious Rebel Commander Franco's government, on condition that no foreign troops will remain in Spain once the war is over. It is also rumored that they will grant him the large loans that he needs to rebuild Spain, idea being to make him less dependent upon his Italian and German friends who helped him win the war.

Ohio Valley Hit By Another Flood

DURING fortnight, more than 30,000 people were driven from their homes in Ohio Valley as heavy rains and snow brought rivers above flood levels. Six persons were reported dead, roads and schools closed, and there were dangerous rock slides in mountain sections. Water supplies in some cities failed and typhoid warnings were issued by health authorities.

Officials estimate that losses due to flood will be well over \$1,000,000. Red Cross and other relief agencies are on the job caring for persons made homeless.

1938 Saw Fewer Auto Deaths

TRAFFIC deaths dropped 19 per cent in United States last year, according to report made by National Safety Council in Chicago, which means that 7,643 fewer persons came to an untimely end in 1938 than in

1937. Number who were killed in nation was plenty large enough—32,000. Nearly 60 per cent of these accidents occurred at night. Most hazardous days were found to be Saturday and Sunday, between 7 and 8 p. m. Safest day was found to be Wednesday between 6 and 7 a. m.

Drop in auto deaths in New York State was 17½ per cent. New Jersey reported lowest number of traffic deaths in that state in 12 years—865—a 32 per cent reduction over 1937.

Carroll E. Mealey, New York State Commissioner of Motor Vehicles, pointed out in his report to Legislature that traffic deaths are not a "necessary evil which must be tolerated" but are something that can be corrected by cooperation of drivers. Proof that public is getting more auto accident conscious

was shown by decline in accidents caused by drunken drivers, reckless driving, and speeding.

Good Books to Read

SCOUTING FOR RURAL BOYS, *Boy Scouts of America*. This is the first Rural Leader Guide Book ever published by the Boy Scouts of America, and will be invaluable to scout leaders, scouters, scout executives, and to all groups of rural leaders for what it presents in rural organization, training, program and activity materials.—*Boy Scouts of America*, 2 Park Avenue, New York, N. Y. \$1.00.

KING GEORGE VI, *Hector Bolitho*. The ascension of King George to the throne of England, under painful circumstances, reads almost like romantic tales of old. But today princes are called upon to

compete with democracy, and their victories must come through character. Prince Albert's quiet, rather retiring life gave no hint of the great future in store for him, yet Mr. Bolitho has traced that career in a way that holds the interest of the reader from start to finish.—*J. B. Lippincott Company, Philadelphia*. \$2.00.

Good Movies to See

GUNGA DIN. Kipling's well known poem forms the basis of a spectacular film which brings the atmosphere of several of his other ballads and tales to the screen. Stirring story of battle and adventure, in which three soldiers, inseparable friends, and a water boy, set out to put down an uprising of a fanatical sect of Hindus. The scenery is particularly fine. Cary Grant, Victor McLaglen, Douglas Fairbanks, Jr., Joan Fontaine.

Whether you want a passenger car or truck "CHEVROLET'S THE CHOICE"

The beauty, performance, driving and riding ease of Chevrolet for 1939 quickly prove that "only Chevrolet gives so much for so little."

For good, sound, honest value, "Chevrolet's The Choice" again in 1939! It brings you higher quality in every part and feature . . . from its extra-powerful, extra-economical Valve-in-Head Engine to its outstandingly beautiful Body by Fisher with New Aero-Stream Styling . . . from its Perfected Vacuum Gearshift*, which does 80 per cent of the work of shifting gears, to its Perfected Knee-Action Riding System†. And Chevrolet brings you all these advantages at new lower prices and with low cost for gas, oil and upkeep. See this car of maximum value at your nearest Chevrolet dealer's today!

Chevrolet's big, brawny trucks for 1939 are designed for the load, powered for the pull, priced to save you money.

The truck for bigger loads and smaller bills . . . the truck for your job this year . . . is Chevrolet! Chevrolet brings you a choice of 45 different models, in eight wheelbase lengths, including new Heavy Duty Cab-Over-Engine models—all selling in the lowest price range! And these new Chevrolets are the great power-pullers of the economy field, the most dependable trucks built today, with Massive New Supremeline Truck Styling, Vastly Improved Visibility, Chevrolet's Famous Valve-in-Head Truck Engine and Powerful Hydraulic Truck Brakes. Save in all ways—in purchase price, in operating costs and in upkeep—by choosing Chevrolet trucks for 1939!

*Available on all models at slight extra cost. †Available on Master De Luxe models only.

CHEVROLET MOTOR DIVISION, General Motors Sales Corporation, DETROIT, MICHIGAN
General Motors Instalment Plan—convenient, economical monthly payments. A General Motors Value

from SKEFF'S NOTEBOOK

By L. B.
SKEFFINGTON

THE other day I went to Webster, where the Monroe and Wayne County poultry committees had arranged a poultry school. It was the day after the big storm and the weather man said there was 16 inches of snow on the ground. In many places it had drifted higher. I know. There were good reasons to expect that the attendance would be small, but 140 persons signed the sheets passed around. To my mind this was very interesting as indicating desire of farmers to learn about improving their methods.

During the past month or more I have been attending "winter meetings" almost constantly. Week after week I am surprised by the turnouts, by the interest shown, and by the good spirit of the gatherings.

First, the sessions of the State Vegetable Growers' Association and the Empire State Potato Club were better than usual. Aside from better attendance, I attribute this to abandonment of the consumer show. After the first show at Syracuse in January, 1937, I said that too much emphasis upon developing a consumer show would spoil a good farm meeting. I am in favor of both kinds of enterprises, but last year proved that the combination as set up at Syracuse would not go.

A show intended to attract consumers must have the appeal of showmanship that it is difficult to obtain as a sideline of a farm meeting. My idea of a consumer show is to stage it in New York City, to reach great masses of consumers. In the meantime, it was apparent to me that the potato and vegetable conventions this year were far more successful from the point of view of being farmers' meetings.

What About Cull Apples?

Both the Rochester and Kingston meetings of the Horticultural Society set new records. In each place Secretary Roy McPherson had to rearrange exhibit space in an effort to accommodate all applicants. At Rochester there is room for expansion by further rearrangement, but the Kingston show presents a problem of finding more space. This speaks for itself—that these two shows have "arrived" in a big way. At both places I talked with exhibitors and found they were pleased, and on almost every hand I heard good comment about the programs.

A highlight of the Kingston program was a discussion of what to do about cull apples. The speaker was W. S. Campfield, secretary of the Virginia State Horticultural Society. The problem, he explained, is that many growers feel that the competition of poor apples often spoils the market for good apples. An illustration was the 1937 season when many apples were dumped because of lack of markets.

The situation has many angles. I remember a reply to a question by Dr. V. R. Gardner, director of the Michigan Experiment Station. Asked if Michigan growers favored cull regulation, he said: "Yes, for the other fellow."

It Can Be Done

Campfield apparently had about the same feeling, for he told the growers how it could be done and then said: "But I don't think you want it."

One way to regulate cull apples, he said, would be by uniform state and federal laws. He estimated that to obtain such regulation in 19 eastern states would take at least 25 years. "You don't have to worry about the western states," he said, "because they will take care of their culls."

When I was in Washington state last

fall I found shipment or sale of apples below C grade was prohibited except to by-products plants. In California it is illegal to ship ungraded fruit.

Campfield could see no use in one state adopting cull regulations unless all of them did so. While federal regulation alone would apply only to interstate shipments, it would leave the way open for growers to dump their junk in markets within their states. State regulation alone would not bar shipment to other states.

"The way out" suggested by Campfield was through sanitary regulation enforced by the federal Pure Food and Drugs Administration. He already had talked with Dr. W. G. Campbell, chief of the administration, and found that the latter now has enough authority for such regulation but no funds to attempt it.

How It Would Be Done

The pure food bureau is charged with enforcing sanitary restrictions on foods and drugs offered for public consumption. Because of limited funds, Campbell explained to Campfield, enforcement now is limited to drugs, cosmetics and such foods about which the public would have no way of determining their purity. In other words, enforcement is confined to impurities or defects not visible to the consumer's eye.

Regulations could be drawn defining apples as suitable for human consumption when free from certain amounts of rot, wormholes, filth, etc. These could be made to apply to culls. "Such regulation might not be ideal, but it would get many of you," Campfield told his audience.

He said such regulation might not go as far as some growers thought it should, but that it would help. "However, I don't think you want it," he challenged.

The pure food bureau chief thought he could undertake such work if given about \$125,000 annually to employ 35 or 40 inspectors.

If the apple industry wants this kind of regulation I doubt if it would be

very difficult to get such an appropriation from Congress.

What, if anything, do growers wish to do about it?

* * *

Porter Gets Duncan Award

Roy A. Porter of Elba, pioneer in packaging and marketing vegetables in consumer packages, has been selected as the recipient of the 1938 award of the Duncan Memorial Fund. This fund was set up as a living memorial to the late H. S. Duncan, originator and director of the State Farm Products Inspection Service. Its purpose is to give recognition each year for outstanding accomplishment in better marketing practices for New York State fruits and vegetables.

Honorable mention was voted to Alonzo G. Allen of Waterville for his leadership in better grading and in obtaining recognition for New York seed potatoes; to Grover C. Farley of Williamson, "for providing a high standard of marketing service for growers of Western New York; and to Jay Gelder of Chazy for originality and versatility in developing marketing practices.

Steuben Co. Potato Convention

CURTAIN raiser for the 12th Annual Steuben County Potato Growers' Convention at Cohocton, February 23, 24, is to be motion pictures of the largest potato farm in the United States, the 6100 acre McDonald Island in the Sacramento River near Stockton, California.

Speakers from four states will appear before the meeting which will pack the auditorium of the Cohocton Union School to discuss marketing, soils, fertilizers, disease and insect control, and other phases of potato production and marketing. A keynote speaker is to be G. W. Lamb, President of the Bank of Cooperatives, Springfield, Mass., in former years Secretary of the New York State Certified Seed Potato Growers' Assn., who comes to Cohocton to discuss the advantages and limitations of potato production in that area as compared with other commercial potato areas of the United States.

Speaking in the same period is Charles Harmon, prominent seed potato grower in Caribou, Maine, and Fred Bateman, machinery manufacturer of York, Pa. A dozen speakers will take part in the discussions that begin promptly at 10 and adjourn at 3 each day.

A new feature of the meeting is to be an exhibit of the 15 lb. bags and other special packs from most of the potato producing areas of the U.S. Classes for both the old and new varieties are

included in the Show, which is predicted by Clerk Art Wager of Cohocton to outnumber the 122 entries of last year's event.

Lee Edmond, chairman of the farm bureau potato committee, extends a cordial invitation to potato growers in Steuben and other counties to attend this 12th annual meeting which is dedicated to the betterment of the potato industry. Write the farm bureau office, Bath, for a copy of the program.

Grange Lecturers' Conference

A conference for Grange Lecturers will be held at Hotel Mizpah, Syracuse, March 2, 3 and 4, in charge of the Lecturer of New York State Grange, Mrs. Stella F. Miller, West Chazy, N. Y. National Lecturer, James C. Farmer, of Keene N. H., will be the speaker one evening and will be present on the 3rd to discuss ways and means of improving the lecture hour and Grange work in general. State Master, Raymond Cooper, and other state officers will attend the conference and take part in the program. Registrations should be sent to the State Lecturer, with the information whether hotel reservation is wanted, and for what time.

Sheffield Producers Elect Officers

At the recent meeting of the Sheffield Producers, the following officers were elected: Harry M. Smith of Bellefonte, Pa., president; W. D. Case of Bloomville, N. Y., vice-president; Homer S. Rolfe of Lisbon, N. Y., secretary; and A. J. Williams of Franklinville, treasurer.

Executive offices of the Sheffield Producers Cooperative Association will be moved from Cobleskill to Syracuse.

The State Trademark

Nearly a year ago a law was passed by the State Legislature providing for state brands and trade marks to identify New York State produce to consumers. Any producer using this trade mark must apply to the Commissioner of Agriculture and Markets for permission to use it, and must agree to observe the rules and regulations as set up by the Commissioner.

One of these rules is that the label shall not be used on any package of farm products until there has been an official state inspection to be certain that it meets the grade, for which inspection a charge will be made.

The state brand label may be used in addition to any private mark or name under which the grower or packer has been accustomed to market produce. The labels are printed and sold by the Department of Agriculture and Markets, and the money received for them is to be spent to advertise the product from which the fund is derived. In other words, money received from the sale of labels for apples will be used to advertise apples.

One of the most interesting exhibits at last fall's State Fair consisted of an apple grader and a potato grader. The apples and potatoes run through the graders were labeled with a state trade mark and sold in consumer packages.

Because of the importance of these two crops, the state brand will be used on them first, but later it is expected that it will be extended to other farm crops. Any producers who are interested in getting further information about the label can do so by writing to the State Department of Agriculture and Markets, Albany, N. Y.

Discuss Cheese Problems

Commissioner Noyes has been holding a series of conferences to discuss possible amendments to the Federal-State Milk Order to protect independent cheese factories in northern New York. This is a live subject in that area. Dairymen have pointed out that in some cases more money has been paid for milk going to independent cheese factories than for milk included in the market-wide pool but which is manufactured into cheese. There is wide belief in the northern part of the state that the situation should be changed so these independent cheese factories can continue in business.

WANTED — ONE ACT PLAYS!

MANY people have grown into the habit during the past several years of sending us a poem for the Amateur Poet's Corner or a short story for possible publication, but few seem to think that they can write a play. Though a different form of expression, playwriting is quite as interesting to experiment with, and not too difficult for a beginner. Amateurs sometimes turn out surprisingly good plays. Why not try your hand at writing one? *American Agriculturist* is sponsoring a contest, with cash prizes, for the

best one-act plays submitted by June 1.

For additional details of the contest and advice on writing a play, write to Play Editor, *American Agriculturist*, Box 367, Ithaca, N. Y., or to Professor A. M. Drummond, Director of Cornell University Theatre, Ithaca, N. Y. Let us know now if you intend to compete.

Picture shows an amusing scene from amateur play, "A Bed of Petunias," produced by students of New York State Colleges of Agriculture and Home Economics during Farm and Home Week last year.

The Outlook for Milk Prices

PART II.

By LELAND SPENCER.

IN THE previous article, we pointed out that milk prices usually follow the trend of commodity prices in general. Sometimes milk prices are higher than the general price level because of strong demand or short supply. Sometimes they are below the general average of prices because the demand is weak or the supply is too large. Occasionally milk prices are pulled out of line for a short time by arbitrary price fixing.

The demand for fluid milk is more steady than the demand for most products, but it is affected by the weather and by the amount consumers have to spend. Changes in the demand for milk show up in the quantities purchased by consumers and to some extent in the prices paid. We have found that consumers use more milk in hot weather, so that sales of fluid milk always increase moderately in the summertime.

Changes in sales of fluid milk from year to year seem to depend upon the condition of business more than upon any other factor. When business is depressed, consumers reduce their purchases of milk. When business picks up, the milk orders are increased. This relationship between business activity and milk sales is shown in the chart.

If you examine the chart closely, you will notice two other things. One is that milk sales do not fluctuate nearly so much as general business activity. During the depression that started in 1929, the TIMES index of business activity dropped about 45 per cent, but milk sales in the New York market were reduced only 10 per cent. Again in the "recession" that started in the summer of 1937, business activity fell about 35 points, but milk sales declined only 5 or 6 per cent.

Another interesting fact brought out in this chart is that milk sales do not fall off immediately when the business index turns downward. Neither do they increase promptly when business begins to improve. Sometimes the lag between business improvement and the up-turn in milk sales has been as much as a year. The most recent low point of business was in May 1938. The exact low point of milk sales is a little uncertain, but it probably fell in July or September. Judging from the records of milk receipts at the New York market, and allowing for the usual seasonal changes, consumers have been increasing their purchases of fluid milk during the past three months.

The people who make a business of forecasting business conditions about the first of each year seem pretty well agreed that the index of business activity will rise somewhat further during 1939. If it does, it is very probable that the demand for fluid milk will be stronger. Better business also would strengthen the demand for cream, ice cream, and butter. This is one of the most encouraging factors in the dairy outlook for 1939.

December Apple Record

An encouraging sign for the apple industry is the out-of-storage movement for December, which appears to have set an all-time record. In the United States the movement totalled 4,547,000 bushels, more than half a million in excess of the previous December and the five-year average. The federal storage figures as of Feb. 1

Index numbers
1925-1929 = 100

VARIATIONS IN NEW YORK MILK SALES AND IN UNITED STATES BUSINESS ACTIVITY SINCE 1929
Milk sales have been rising the past few months and will go higher if business improvement continues.

show holdings in the Midwestern and Shenandoah sections to be a third less than a year ago. Holdings at the first of the year in the United States were 18 per cent lower than a year earlier, and in the Northeast the decline in holdings was 17 per cent. Only the Pacific Northwest had anywhere near as many apples as a year earlier.

Also it will be noted that the market is much better than it was a year ago. A smaller crop is in part responsible for this, and it is evident on every hand that the continuing promotional efforts of the Apple Institute and other organizations is having its effect.

It was noticeable at the Rochester and Kingston meetings of the growers that speaker after speaker emphasized the value of keeping up the trade promotion and advertising work. A few months ago in the office of the Washington State Apple Commission I was impressed with a scrapbook showing how apples are getting publicity in magazine articles and in many other ways beyond the usual range of promotional effort. I was told that "editors are becoming apple conscious." If this is true, it shows the value of continuing and enlarging the promotional effort.

To my way of thinking, a woman friend put her finger on the problem or at least part of it. She said: "Convince women that apples are good for their health and beauty and growers will have no trouble getting rid of their crop."—Skeff.

Bigger Markets for Fruit Juices

Good word for future prospects of selling more apples in the form of juice is statement of Dr. D. K. Tressler of N. Y. Agricultural Experiment Station.

Dr. Tressler says that the future of the fruit industry should be bright, if the widespread interest in the development of new uses for fruits and fruit products shown by research workers in Government and State laboratories and in private industry can be taken as an indication of what may be expected during the next 10 years.

He predicts that canned and bottled apple and cherry juices will become important all-the-year-round beverages within the next decade and that the production of these juices will utilize millions of bushels of first and second grade apples and cherries. Frozen sliced apples and the making of apple flakes or apple flour for the baker are expected, he says, to absorb large quantities of apples.

The introduction of quick freezing units and cold storages by farmers operating roadside stands, he believes, is already within the realm of possibility and, coupled with an increas-

ing use of cold storage lockers, means that more and more fruit will be preserved for use either by the farmer and his family or for sale out of season to his customers.

Eggs

About the first of February the State Department of Agriculture and Markets figured that it took 8.4 dozens of eggs to buy 100 lbs. of feed. A year ago it took 8.6 dozens, two years ago 10 dozens.

As compared to last year, poultry feed averaged to cost 20c a hundred less. The price of eggs received by producers average 2c a dozen less than a year ago.

The American Produce Review estimates that storage holdings on January 28 were 144,000 cases, compared with 343,000 cases a year ago; and that frozen eggs on the same date totaled 52,598,000 lbs., compared with last year's figures of 96,952,000 lbs.

Recent drop in egg prices left those who made early predictions of trend out on the limb. Despite low storage stocks, prices went down, the chief explanation given being heavy production.

Butter

On January 28 the American Produce Review estimated storage holdings of butter of 114,124,000 lbs. (of which about 26,000,000 lbs. were owned by private trade), as against estimated holdings of 32,500,000 lbs. on the same date a year ago. Up to January 27, 46,207,230 lbs. of butter had been released by the Federal Surplus Commodities Corp. to various state relief agencies.

The sales of oleomargarine for the month of December were 19.8% less than in December of 1937; and for the year of 1938, sales of oleo were 3.8% lower than in 1937.

Farm Prices

The State Department of Agriculture and Markets reports that prices of farm products for January were 1 point higher than for December. Prices were higher for grains, potatoes, milk cows and horses; lower for eggs and apples; and slightly lower for beans, hogs, butter, veal calves, lambs, and wool.

Prices of farm products were 1 point lower than they were in January a year ago.

For the entire country prices of farm products were 2 points lower in January than they were in December, and 8 points lower than they were a year ago.

Prices paid by farmers for things purchased were 20% higher in January than they were in 1910-1914.

Stocks of Danish cabbage as of January 1st were 2½ times as large as a year earlier and late onions 8% higher. The South is shipping a heavy crop of early cabbage in spite of some cold damage in the shipping sections. Canned vegetables are held in ware-

Winner of Sheep Shearing Contest

John E. Jeffers, winner of the 1st International Sheep-Shearing Contest at the Chicago Livestock Show. His time was three minutes five seconds, but judging was also based on quality of work done. Mr. Jeffers is a custom shearer, and averages 135 sheep a day.

First prize of \$100 and 3 other cash prizes were awarded by the *Chicago Flexible Shaft Company* of Chicago, Ill., and all contestants used electric shearing machines manufactured by that company.

E. I. du Pont de Nemours & Company of Wilmington, Delaware, have a small folder entitled "Uramon for Fruit Trees", which they will be glad to send on request. Uramon is a concentrated nitrogen carrier containing 42 per cent urea nitrogen.

Redbird Farm, Route 11, Wrentham, Mass., announces that despite the wind damage caused by the September hurricane, the farm is increasing its facilities. A new broiler house has recently been completed and is the largest building on a farm famous for big buildings.

The building will be used to finish off surplus cockerels resulting from the large demand for partly-grown pullets. A four-story laying house is rapidly being pushed toward completion.

Mr. George Hagopian has established a foundation flock of production-bred Leghorns. It has been his aim to produce all eggs incubated on the farm. He now has about 62,000 breeders, all Massachusetts-U. S. pullorum clean.

Bayer Semesan, Inc., Wilmington, Delaware, will send free of charge blueprint showing details of manufacture of a seed duster made from a 30-gallon oil drum.

The Nitragin Co., 3808 N. Boothe St., Milwaukee, Wisconsin, will be glad to

send "Legumes for Profits." Authorities state that inoculation of legumes, which costs only a few cents an acre, is always good insurance, and absolutely necessary if proper bacteria is not present in the soil.

Starline, Inc., Dept. 1036, Albany, N. Y., will be glad to send a 64-page farm plan book. For your convenience, you will find a coupon which you can use on page 21 of the February 4 issue.

The Carnation Co., Dept. D, Oconomowoc, Wisconsin, have three booklets available to readers. The titles are:

1. Do you have Plenty of Skim Milk?
2. Most Economical Way to Feed a Calf.
3. What? A feed Better Than Milk for Young Stock?

They are yours for the asking.

"Mealtime Magic with Milk," containing some new recipes, will be sent you if you will drop a post card request to the *Bureau of Milk Publicity*, Albany, N. Y. Mention *American Agriculturist* when you write.

Did you tack up the back page of the February 4 issue in your brooder house? It contained valuable suggestions for rearing baby chicks from the *Cooperative G.L.F. Exchange*, Ithaca, N. Y.

NORTHSTAR—A Promising New Medium Early Strawberry. This noteworthy introduction recently released by the U. S. Department of Agriculture is the sensation of the season. The big, beautiful berries rival Fairfax in quality. W. F. Allen Company, strawberry specialists, at Salisbury, Md., report harvesting "a larger percentage of large berries" than any other variety grown by them. Northstar is recommended as a second early variety for both home and market planting.

NEARBY MARKETS for NEARBY POULTRYMEN

Egg Prices

By J. C. HUTTAR

I WAS out in Cleveland on the first of this month in a meeting of egg producers, egg dealers and federal government officials. The rapid collapse in egg prices in early January brought this meeting about. It was called to determine whether the Federal Surplus Commodities Corporation should include the purchase of eggs in its relief distribution program.

J. C. Huttar

Dewey Termohlen, Chief of the Poultry Section of the A.A.A., presided and explained the law under which such purchases were authorized.

He pointed out first that the law said quite specifically that a burdensome surplus of any farm product must be proven before such government purchases of any product can be made. Then he said that these products must be distributed to people on the relief rolls of the country in accordance with their reasonable needs for a well balanced diet.

In general, a surplus seems to be burdensome when production for a part of a year is so great that dealers, speculators, and investors are unwilling or unable to finance in storage that part of the supply which cannot go into immediate consumption, except at a price so low as to mean big losses to producers. In such a case, says the Department of Agriculture, production is so discouraged as to cause a severe shortage and resulting prohibitive prices to consumers.

Weather conditions were so favorable during November and December that a heavier production was brought on all over the country than the markets could absorb without drastic price drops. The purpose of these price drops is to get a lot of folks back to eating eggs again who quit when eggs were so high in price in the fall. Fortunately, this year retail prices came down sooner than usual after the wholesale price drop, and the period of piling up of eggs in the wholesale market was shortened. Of course, more wintry weather had something to do with this too.

Two separate meetings were held in the morning at Cleveland. In one room the producers, hatcherymen and poultry journal editors met and in the other room the egg dealers. Being an employee of a producers' egg marketing cooperative, I was allowed to attend both meetings. So I divided my time between the two. The thing I got the most kick from was the reasonableness of both groups.

The producers discussed the problems along these lines: First, eggs are an important source of income to farmers and are also a highly nutritious food for the needy. So egg purchases for relief are very worth while. Second, if the government should try to support the price level, how high or how low should they try to hold the minimum. And here's where I thought the producers showed an especial amount of good sense. It was pointed out by a producer that feed was cheaper than last year and if prices were artificially supported too high, this spring's hatch would be so big that the surplus problem would be tremendous in another year. So he

didn't favor too high a level.

After apparently going over this second problem thoroughly (I didn't sit in on this whole discussion), the producers' group recommended a price level for the spring not more than one cent a dozen below last year's prices.

Third, the producers recommended that purchases be made for immediate distribution only, and not in quantities that would have to be stored and thus depress the market for some time to come.

The Dealers' Viewpoint

The egg dealers also displayed a lot of sympathy for the other folks' point of view. After a very thorough discussion in which many parts of country were heard from, they came out with these general recommendations:

First, that they too favored the purchase of eggs for immediate relief distribution only.

Second, that egg dealers on general principles didn't favor government participation in their business. They contended that it upset the orderly processes of distribution.

Third, that the purchasing which was done be at a price level somewhat lower than that recommended by the producers. Their argument was that private capital would have to finance the biggest part of the spring's surplus production. The people who have furnished this capital have a right to expect the price level to be low enough on the surplus so that their capital will be reasonably safe. They contended that these folks have become discouraged because in the last twenty years there have been many more years of losses than of profits in financing storage eggs.

Joint Meeting

In the afternoon, the two groups met jointly in one common meeting. They ironed out most of their differences pretty well, and let those points on which they could not come together stand as separate recommendations.

Now, Dewey has gone back to Washington, together with Bob Osborne, who represented the Federal Surplus Commodities Corporation at the meeting.

The procedure now is for Dewey's poultry section to watch prices, production and the weather. When he thinks a burdensome surplus in eggs is to be found in the market centers, he will recommend to Osborne's outfit to buy eggs, where to buy them, and at what prices.

The F.S.C.C. will then arrange the actual purchases and see that the eggs are properly distributed to folks on relief.

Have you purchased your dollar membership in the World's Poultry Congress yet?

"It's my first operation, girls!"

NEARBY MARKETS for NEARBY POULTRYMEN

The World's Poultry Congress — A Challenge

By L. HARRIS HISCOCK,

Chairman, New York State World's Poultry Congress Committee.

WHEN the Seventh World's Poultry Congress and Exposition meets in Cleveland, Ohio, July 28th to August 7th, 1939, it will represent the grand climax of the most intensive drive that the poultry industry and all its allied interests have ever undertaken. If a true story of how the Congress came to America were ever written, I believe it could honestly be said that a few of our national poultry leaders brought the World Poultry Congress to

try, but you are contributing your share to make the Congress better and larger.

In all the states where people are being asked to support the Congress financially by the purchase of a dollar participating membership in this International undertaking, we are being asked: just what does it all mean and what benefit are we as poultrymen going to derive from this meeting next summer? By purchasing a membership in the Congress and so adding your mite in support of it, you are contributing to one of the greatest consumer-education campaigns which has ever been attempted in this country, for it can truthfully be stated that the major theme of the entire Congress will center on consumer education. In the year following the holding of the World Poultry Congress in Canada, the use of poultry products in that country increased 30%. The increase in the use of our poultry products in the months succeeding this event next summer will depend solely upon the actual participation of everyone of us in furthering and supporting the activities of the Seventh World's Poultry Congress.

Out of the \$1.00 you pay for a membership in the Congress, 75% goes to the National Committee for Poultry Congress activities, the balance to the State committee so that, with your purchase of a \$1.00 membership, you are making a direct contribution to your local committee. And in New York State, you are helping to make it possible for at least thirty 4-H boys and girls and Future Farmers to go to Cleveland to participate in the eleven-day Youth Program, for that is what our share of your dollar is to be used for. Here they will meet with the Youth from forty-seven other states, compete with them in judging and demonstration contests and enjoy the

(Continued on Page 22)

L. Harris Hiscock

this country as a challenge to a great but sleeping industry, an industry which rates at a billion a year as an agricultural commodity but which, from the standpoint of organization and the defense of its own heritage and rights, has seldom stood up to fight.

It would be impossible for me in such a short article to go into all the details of this wonderful international event at which the United States of America will play host. I assume that almost everyone is familiar with what the Congress will have to offer with its national and international exhibits, commercial exhibits, competitive live bird exhibits, gigantic consumer programs, scientific and popular programs, an eleven day Youth program; in short, programs of such appeal that anyone connected in any way with the industry will want to be present and not miss the chance of a life-time. Here is a poultry event of such startling significance that it makes one realize that poultry keeping has jumped from the backyard onto the front page of newspapers and magazines the country over. It is indeed significant that, if the poultry industry had attempted to purchase the amount of advertising that this great event has received, the bill would amount to well over \$300,000.00.

To carry out the program of the World Poultry Congress, the problem of financing it was essential. The budget of the Congress is based on two sources of revenue: the sale of exhibit space and the sale of one dollar participating memberships. While the sale of exhibit space can carry the current expenses of the Congress, the sale of memberships will determine without question the extent of the actual program. By purchasing a dollar participating membership, you are not only expressing faith in the poultry indus-

HAROLD J. SHAW
MAINE BREEDER
AND OWNER OF
"MISS TWO-MILLIONTH"

"MISS TWO-MILLIONTH"
DAUNTLESS DIRECT LESEYLE RUTH
NO. 2,000,000 IN THE HOLSTEIN-
FRIESIAN HERD BOOK

H.F.A. of A.

Two Millionth Holstein Cow Registered

A MILESTONE in dairy breed progress was reached the other day at Brattleboro, Vt., when the Holstein-Friesian Association of America issued registration certificate No. 2,000,000 for a Holstein-Friesian female. No other breed of cattle, either dairy or beef, reports the Extension Department of the Holstein-Friesian Association of America, has closely approached this record. Her predecessor in this bovine numbers game came 1925, when the 1,000,000th Holstein-Friesian female was registered, just forty years after the present herd book was started.

The lucky number came up for a baby calf of distinguished parentage in the herd of Harold Shaw, Maine, leading dairyman and Milk Control Board Member of the Pine Tree state. Dauntless Direct Leseyla Ruth 2,000,000, which is the official name of "Miss Two Millionth", is a daughter of the Shaw herd sire, Baker Farm Dauntless 668,530. Her dam, Direct Leseyla Ruth 1,717,523, is by another famed sire, Ormsby Direct 553,013, and not only has a production record of 672.4 lbs. fat in a year at 3 years of age, but was crowned champion of the Maine DHIA show in 1938. The Shaw's Ridge Herd has been on continuous test for production in the Holstein Herd Test for the

past 11 years, and has averaged 431 lbs. fat per year for the period.

This milestone in registrations spotlights the wide acceptance of registered Holstein-Friesians by the dairymen of America, and the contribution this breed has made to dairy progress. Originating in Holland, the imported foundation numbered only 7757 head during the period from 1852 to 1905, with none since the later date, and the largest numbers during the 'eighties. The story of the fecundity of the big Black and White Cow is strikingly told by "Miss Two Millionth" and the organization of 32,000 members which can trace her family tree back through the years in every generation to those original imported foundation animals.

ARE FOXES ON THE INCREASE? — Hunters in Ontario County, N. Y., report foxes were plentiful last winter. Photo of a group of Stanley hunters with fox pelts as a background shows that these reports are true. From left to right: Charles Pelling, Clyde Johnson, Donald Shaner, and Cordia Melious.

Black Leaf 40 Kills
LICE and FEATHER MITES

• "Black Leaf 40" with our "Cap Brush" Roost Applicator enables you to cut your delousing costs three-fourths. "Black Leaf 40" has plenty of reserve strength not only to kill adult lice but to kill young lice, as they hatch.

For individual bird treatment apply a drop two inches below the vent and on the back of the neck to kill body and head lice.

"Black Leaf 40" is sold by dealers everywhere. Insist on original factory sealed packages to insure full strength.

The World's Poultry Congress

(Continued from Page 21)

greatest experience of their lives. Remember! These boys and girls of to-day are the poultry leaders in our industry of to-morrow.

By supporting your local committee, by working for the Congress, you are doing an untold good to the poultry industry in your state. As chairman of the New York State Committee I can state without hesitation that the work for the Poultry Congress has done more to unify the poultry industry and all its allied branches than any other single event in our history. We have not only become acquainted—poultrymen, men in our Agricultural Colleges and in the Agricultural branches in Albany—but we have learned to work side by side, shoulder to shoulder, for the good of a common cause. We have gained a knowledge and a glimpse of a truly great industry that needed just such a thing as the Poultry Congress to rouse it from a sleeping giant into a truly great billion dollar industry. Think of it! A little over a year ago we were just a lot of poultry people. To-day we are forty-eight states strong. Forty-eight state committees working for the Poultry Congress. Tomorrow these same committees will be the future minute men of the Poultry Industry.

Short Winters

(Continued from Page 8)

noon instead of sailing at the crack of dawn. It's the same way with winter jobs on the farm; nine-tenths of them are started right after breakfast or not at all.

But perhaps things aren't quite as bad as my wife thinks they are. To be sure, some of our this winter's list of promised accomplishments will have to go over to next winter's catalogue of jobs-to-be-done, but nevertheless whenever I scrape the frost off a window-pane and gaze guiltily across the snow-clad fields and meadows, I can see lots of things that in some mysterious way have got themselves done in the course of the last two or three months.

Farm improvements—apart from the routine of seed-time and harvest, of barn chores and house chores—move in the ponderous manner of the glacier. From day to day you can't detect any progress at all. But if you set up marks on the bank and keep records, you'll find that in the course of the years she's moved down the road quite a piece. I guess, mebbe, we'll be able to make out and get ahead in spite of the school bus and the short winters.

MRS. GRACE WATKINS HUCKETT

Lesson XI. BREADS

IN ORDER to predict how any bread mixture will behave, a few fundamental facts about flour will help. "Strong" flours suitable for yeast breads are made from hard wheats, which are richer in gluten than soft wheats. From the latter come the "weaker" flours, which we actually prefer for quick breads, cakes and pastries.

Kneading makes gluten more elastic; therefore it better holds in the bubbles of gas given off as the tiny yeast plants feed upon the sugar and starch of the bread mixture, a process of fermentation actually. Cooking kills the yeast and stops the fermentation, besides developing pleasing flavor and giving the loaf a permanent form. By the same token, soaking a yeast cake in too hot water or overheating while raising will kill these plants.

It takes time for yeast plants to grow and make dough light; hence the wide use of so-called "quick" breads. Of course, "quick" breads also depend upon gas for their leavening but it is provided by the union of baking powder with liquid or by soda with some acid, as sour milk, lemon juice, vinegar, cream of tartar or molasses.

In the case of pop-overs or Southern beaten biscuit, no leavening agent whatever is used, the lightness of popovers depending upon sudden expansion of moisture into steam, and the lightness of beaten biscuit upon the expansion of air which has been pounded into the dough.

"All-purpose" flours are mixtures of wheats and are designed to make good average bread or cake. If we want top-notchers of either class, then for bread we need a bread flour rich in gluten, and for cake, a cake flour with more starch. Bread flour feels more gritty when rubbed between thumb and fingers; cake flour holds an imprint better when squeezed in the palm and is whiter than bread flour, which should look slightly yellowish. Pastry flour is not so finely milled as cake flour and contains more gluten. Hence it is especially good for baking powder biscuits as well as for pie crusts.

Convenient proportions to carry in mind when remembering quantities needed in bread mixtures are:

Pour batter: equal parts by measure of flour and liquid.
Drop batter: 2 parts of flour with 1 part of liquid.
Soft dough: 3 parts of flour with 1 part of liquid.
Stiff dough: 4 parts of flour to 1 of liquid.

Making breads is easy and interesting and how the family responds! A system of work makes it easier; here are a few hints that may help in that respect:

- 1—Assemble all ingredients and all utensils before starting to mix.
- 2—See that your oven will be right when it is needed.
- 3—Sift flour once before measuring; measure all ingredients accurately using standard measuring cups and spoons. Use only tested recipes from a reliable source. Such recipes are based upon level measurements unless otherwise stated.

SOUR CREAM OR MILK GRIDDLE CAKES

1 cup flour	1 cup thick sour milk or cream
½ tsp. salt	1 egg
½ tsp. soda	1 tbsp. melted butter added last if milk is used.
1 tsp. baking powder	

Break the egg into a mixing bowl, add the liquid and sift into it the mixed dry ingredients. Beat until well mixed and drop by spoonfuls on a hot griddle. The bottom should be browned nicely when the top is well puffed and ready to turn. Do not turn twice or the cakes will be heavy.

Variation: If sweet milk is used, omit soda and

increase baking powder to 2½ tps. Since sweet milk has a more thinning effect on the batter, ¾ cup will be all that is needed.

POPOVERS

1 cup milk
2 eggs
1 cup sifted soft wheat flour
1 teaspoon melted fat
½ teaspoon salt

Stir liquid slowly into dry ingredients to avoid forming lumps. Half fill hot well-greased muffin pans,

preferably iron or granite, or custard cups (not more than half full) and place at once in a hot oven, about 425°. After about 20 minutes lower the temperature to about 350° so that the protein in the eggs and gluten will "set" thoroughly and the shell is crisp and brown. Total time of baking is about 45 min.

MUFFINS

2 cups flour	1 cup milk
¼ cup sugar	4 tps. baking powder
¼ cup fat	½ tsp. salt
1 egg	

Mix by the cake method—creaming butter, adding sugar, beaten egg, milk and sifted dry ingredients. This gives a better texture, fewer tunnels and

—Photo courtesy General Mills, Inc.

Delicious homemade breads and biscuits are easy to make, and how the family responds!

QUESTIONS

(Send your answers to the following questions to American Agriculturist Cooking School, Box 367, Ithaca, N. Y., not later than March 4.)

- 1—Why does hard wheat make better bread flour than soft wheat does?
- 2—(a) How does yeast make bread light?
(b) How are quick breads made light?
- 3—Why is yeast bread kneaded and quick breads only slightly so, if at all?
- 4—If you were buying your flour in bulk, how could you tell whether it was better for bread or cakes?
- 5—Looking at the recipes given with this lesson, how would you classify each one as to batter or dough proportions?
- 6—In which class would pie crust belong? (See Pie Lesson.)
- 7—How would you classify Foundation Cake? (See Cake Lesson.)
- 8—How does the dough of yeast rolls differ from that of yeast bread?
- 9—What have flour manufacturers put on the market in recent years to make quick breads easier to make? Name at least five different brands.
- 10—Do you make yeast breads at home? Do you use dry or compressed yeast?

EDITOR'S NOTE: If you have not already sent to the following companies for recipes and other printed matter, we suggest that you do so in connection with this lesson on Breads, and mention that you are enrolled in the American Agriculturist Cooking School:

Pillsbury Flour Mills Co., Minneapolis, Minn.
Washburn-Crosby Mills, Minneapolis, Minn.
Cooperative G. L. F. Products, Inc., Ithaca, N. Y.
R. B. Davis Baking Powder Co., Hoboken, N. J.
Calumet Baking Powder, c/o General Foods, 250 Park Ave., New York City.
American Sugar Refining Co., 120 Wall St., New York City.
National Sugar Refining Co., 129 Front St., New York City.
Proctor & Gamble, Cincinnati, Ohio.
Lever Bros., 164 Broadway, Cambridge, Mass.
Swan's Down Flour, c/o General Foods, 250 Park Ave., New York City.

better crust than the regular "muffin method" which adds melted fat last to the mixture. Bake in greased muffin tins at 400° for 25 minutes.

To vary: Add spices, nuts, dates or raisins.

BAKING POWDER BISCUITS

2 cups flour	¾ cup milk
3 tps. baking powder	4 tbsps. butter or other shortening
½ tsp. salt	

Sift flour once, measure, add baking powder and salt and sift again. Cut in shortening, add milk all at once and stir until flour is dampened. Then stir vigorously until mixture forms a soft dough and follows the spoon around the bowl. Turn out on slightly floured board and with the fingertips knead lightly 12 or 15 strokes. Roll or pat ½" thick, cut with floured cutter, bake on ungreased baking sheet 12 to 15 minutes in hot oven (450°). (Makes one dozen 2-inch biscuits).

To vary: 1—Substitute sour milk for sweet. Add ½ tsp. soda and decrease baking powder to 2 tps.

2—Sprinkle tops of biscuits with grated cheese and a dash of cayenne before baking.

3—Roll dough ¼" thick, cut in rounds, brush the lower one with melted butter, put on a dab of marmalade, top with another round of dough and bake in a hot oven.

4—Roll an oblong of dough ¼" thick, brush with melted butter, coat with sugar lightly mixed with cinnamon, sprinkle with nuts or raisins, then roll like a jellyroll; cut ¾" slices across and place cut sides down in muffin tins. Bake in quick oven.

YEAST BREAD (Straight dough method)

1 cup scalded milk	2 tbsps. sugar
1 cup lukewarm water	1 tsp. salt
1 tbsp. lard	1 yeast cake
1 tbsp. butter	6 cups sifted flour

Let yeast cake stand in lukewarm water until softened. Pour warm milk on (Turn to opposite page)

NECKLINES are Flattering

THE FORM fitting dress is still the big idea as far as dresses are concerned. Skirts for evening dresses usually billow or flare, but for daytime wear they limit themselves to convenient rippling.

At this time every year, springy looking prints appear to liven up the costume. Flower prints strongly predominate.

Princess Dress Pattern No. 2147 with its flattering new neckline and cunning high-up pockets is not only easy to make but charming to look at. Pattern sizes are 11, 13, 15, 17 and 19 years. Size 15 requires 3 3/4 yards of 39-inch material with 1 1/4 yards of 1-inch bias binds.

Layette Pattern No. 2781 is designed for a complete outfit for a small baby or for the large baby doll. The sketch shows what is included in the

set of patterns, which are in one size only; the material requirements are stated on the pattern envelope.

TO ORDER: Write name, address and pattern size and number clearly and enclose 15c in stamps. Address Pattern Department, *American Agriculturist*, 10 North Cherry St., Poughkeepsie, N. Y. Enclose 12c extra for a copy of our new Spring Fashion Magazine.

The A.A. Cooking School

(Continued from opposite page)

butter, lard, sugar and salt in a mixing bowl. When lukewarm, add dissolved yeast cake and flour to make a stiff dough. Turn on a floured board, knead until mixture is smooth, elastic to touch and bubbles may be seen under the surface. Return to the bowl, cover with a clean cloth and a plate or other tight cover, let rise overnight in a temperature of 80-85° F. It should double its bulk.

In the morning, punch down in the middle, pull the sides into the middle and turn the smooth side up. This allows fermentation to continue without danger of stretching the gluten too much. Allow dough to rise again. Knead on board, shape into loaves or biscuits, let rise at 80-85° F. until again doubled.

Bake in fairly hot oven at first, about 400-415° F. for a 1 1/2 lb. loaf, higher for smaller loaves. Turn around in the oven after 20 min. and lower the temperature slightly. Baking will require from 45 min. to an hour for loaves, 15-20 min. for rolls. Brush with milk or butter just before removing from oven. Cool without covering on racks.

Variation: 1—Use 1 cup white flour and the rest of entire wheat.

2—A sponge may be made by combining the liquid, yeast and 1/2 the flour; let stand overnight at 65-75° F. In the morning, add all other ingredients and proceed as for the straight dough method.

3—Rye bread may be made by the sponge method, using half rye and half wheat flour.

Icebox Rolls

1 cake compressed yeast	1 egg
1/4 cup lukewarm water	1 1/2 tsp. salt
1/2 cup shortening	2 cups scalded milk
1/2 cup sugar	8 cups sifted flour

Soften the yeast in the water and add about 1 tsp. sugar. Cream the shortening, add sugar, the beaten egg and cooled milk, then the yeast. Stir in the sifted flour and salt until the dough is stiff enough to knead. Toss on a floured board and knead from 10 to 15 minutes or until the dough is smooth and elastic. Put the dough into a greased bowl, brush the surface of the dough with melted fat and keep in a warm place until doubled in bulk. Turn on the board, knead, again grease the surface of the dough, cover and put in the refrigerator. When rolls are wanted, cut off the dough that is needed, shape, place on greased sheet or pan, put in a warm place to double in bulk, then bake in a hot oven, about 400°, from 15 to 20 minutes. This dough will keep for 3 or 4 days or even for a week in cold weather.

Grange Cleanings

(Continued from Page 2)

by Mrs. Harry B. Caldwell of Greensboro, North Carolina.

* * *

LIBERTY GRANGE, No. 99, at Marlboro, New Jersey, has just celebrated its 63rd anniversary and took the time to dedicate an attractive new Grange home the same day. The latter was made possible through the fortunate purchase of an unused church last November, which has been admirably remodeled for Grange uses. The equipment of the new hall is complete and the structure represents a great amount of volunteer labor. State Lec-

turer Howard B. Hancock was the principal speaker of the occasion and Patrons came from a great number of New Jersey subordinates.

* * *

CONNECTICUT PATRONS are very happy over the fact that the wife of their State Master, Mrs. Cora D. Tucker, has been named as chairman of the Home Economics Department of the National Grange. Mrs. Tucker is an experienced Grange worker, is widely known throughout her state and the possessor of much executive ability, which especially fits her for the duties of her new position.

* * *

A RECENT Grange rally meeting at Lynn, Massachusetts, brought out nearly 1,000 members to welcome National Master Louis J. Taber, while the official force of New England was extensively represented. The mayor of Lynn welcomed the visiting Patrons and a full evening's program was carried out, including a joint installation of officers, Pomona and subordinate.

* * *

THE DEATH of Arthur A. Brigham recently at Lakeland, Florida, recalls a New England Grange leader of 50 years ago who was very active in building the organization. Mr. Brigham was for two years Master of the Massachusetts State Grange and organized many subordinates in that state; he did much of the pioneer work which started the Order in Rhode Island; later organized the first subordinates in South Dakota, out of which grew the State Grange; and during his last days spent in Florida he even organized some subordinate Granges there. Mr. Brigham was 82 years old.

Today in Aunt Janet's Garden

Get Set to Go!

WHEN I look outside and see the sun shine from a bright blue sky, even though the earth is still white my fingers begin to itch and my mind gets busy with garden plans. But experience has taught me that a little self-restraint is needed and that oftentimes plants get off to a better start if seeds are not planted so early that the plants get spindly before they can be put outside.

I have learned that preparedness is half the battle for many garden chores. With seeds on hand, soil sterilized, and flats in readiness, actual seeding can be done quickly. It is the getting ready which takes the time.

Other things which need inspecting, to be sure that they will be ready to plant when the time comes, are roots, corms and bulbs. Gladioli corms which have been treated with naphthalene flakes before storing should be shaken out now, since they probably will start during February to form root knobs. If the naphthalene is left on, these may be injured.

If dahlia roots have dried off too much, they can be soaked in water enough to plump them up, or they may be sprinkled and covered with newspapers. The main damage to dahlias occurs at the base of the stems where the "eyes" are. After the roots are plump again they can be stored as they were originally, with some dry covering to prevent further drying out.

Any other summer bulbs such as tigridia or Ismene lilies, should be examined to see how they are faring. If necessary, they can be plumped the same as the dahlias.

On warm days lightly stir the mulch around perennials to be sure that air gets in. This may be repeated several times before it is safe to remove the protection altogether.

This Home-Mixed Cough Remedy is Most Effective

Easily Mixed. Needs No Cooking.

Cough medicines usually contain a large quantity of sugar syrup—a good ingredient, but one which you can easily make at home. Take 2 cups of granulated sugar and 1 cup of water, and stir a few moments until dissolved. No cooking! No trouble at all.

Then get from your druggist 2 1/2 ounces of Pinex, pour it into a pint bottle, and add your syrup. This gives you a full pint of truly wonderful medicine for coughs due to colds. It makes a real savings for you, because it gives you about four times as much for your money. It lasts a long time, never spoils, and children love it.

This is actually a surprisingly effective, quick-acting cough remedy. Instantly, you feel it taking hold. It loosens the phlegm, soothes the irritated membranes and makes breathing easy. You've never seen anything better for prompt and pleasing results.

Pinex is a compound containing Norway Pine and palatable guaiacol, in concentrated form, a most reliable soothing agent for throat and bronchial membranes. Money refunded if it doesn't please you in every way.

When writing advertisers be sure to say that you saw it in AMERICAN AGRICULTURIST.

come, thirty-eight of them. I was watching out for Coleman, but he didn't appear until after I had called the school to order. Then I heard a loud stamping of feet in the entry outside. The door was thrown back and the young giant walked in. Seeing that school had begun, he stopped on the floor and stood staring at me with an evil grin.

"Take your seat," I said. I expected we would have trouble right there; but I guess he didn't quite like the looks of me. He slouched up into the darkest corner of the back seat, and all the while till recess time he sat there watching me, like a cat. Out of the corner of my eye I was watching him, too. I didn't mean he should catch me unawares.

"When at length I gave the boys their recess, he followed the others out, still staring hard at me, as if he were not quite able to make up his mind what move to make first.

"His manner was so insolent that I had half a mind to collar him as he passed me. Afterwards I went to the outer door to see what was going on. Young Coleman stood in the yard a few steps away, facing the door. The moment I appeared he shouted, 'I stump you out here!' I was out there before he had more than spoken. He clenched me like a tiger, and the other boys scattered. He was strong as a moose, but I saw at once that he had no skill as a wrestler. I let him yank and twitch at me at first till I learned what he could do and how I could best conquer him. He kept yanking at me, and we went all over the yard. The little pupils began to cry.

"I found that he couldn't get me off my feet, and now with a quick trip and leg-lock I threw him on his back and jumped clear of him. I thought he probably had had enough of it. But I didn't know him yet. He jumped to his feet with a howl and came at me head down to butt me in the stomach. I stepped away and with a blow knocked him face-down on the ground. That set his nose bleeding and roused his bad temper. He burst out cursing me, doubled his fists, rushed forward and struck at me with all his might. I parried the blow, and, since he wanted a fist fight, I gave him back one over the eye that landed him on his back again. But he was up in a moment and came at me, striking wildly, blindly, with all his strength. He would have killed me if he could. With his nose streaming blood and his hair dishevelled, he looked like a maniac.

"I thought it was high time to end it, for half the smaller children were crying and the girls rushing out, some of them running toward the nearest neighbors, screaming that the new master was killing Jack Coleman! I closed with him, threw him, then held him down and choked him till he gave in. 'Don't! Don't!' he gasped. 'I'm licked!' I twitched him up to his feet, twirled him round and gave him a couple of kicks in the direction of the schoolhouse door. 'Go back in, and take your seat,' I ordered, and he went.

"I wasn't in the least hurt myself, but my old coat sleeves were!

"By this time half a dozen people, men and women, had come on the run in response to the alarm the little fellows and the girls had raised, and for a while there was a commotion while I explained what had occurred. The school agent had appeared and was the most tickled man I ever saw. He kept patting me on the back, muttering, 'Good boy! Good boy!' Young Coleman's father, or his uncle, had also reached the schoolhouse, and he walked up to the back seat, where his son sat, still mopping his nose, to look him over and ascertain how badly he was hurt. When he came back to the master's desk where I stood, I was afraid

Some Go Singing

By M. Lucille Ford.

Some folk go about their work, sour,
glum and blue,
Wishing they were some where else —
and they make you wish it, too.
Some folk go half-heartedly, their
thoughts afar are clinging;
Some folk howl, and some folk growl —
and some go singing!

Some folk walk along the street, sober,
sad and grave,
Saving smiles for some place else, or
maybe none to save;
Some with heads among the clouds see
nought as on they're swinging,
Some in a huff, and some are rough —
and some go singing!

Some folk live from day to day,
grouchy, selfish, mad,
Never speak a kindly word — maybe
never glad.
Some folk mope and whine and fret
as time it's way is winging,
Some folk jeer and some folk sneer —
and some go singing!

at first that I might have to fight him, too. But he shook hands with me. 'Glad to know you,' he said. 'Glad of it. Jack has needed that for a good while. He got too big for me to thrash,

"Far Countries for to See"

(Continued from Page 1)

intensely to visit! Westminster Abbey, the grim old Tower of London, where they cut off heads in the grim old days, the Houses of Parliament, beautiful St. Paul's Cathedral, and Buckingham Palace, where the King and Queen and the little princesses live when they are in London. Ever hear the "changing of the Guard?" We will see that picturesque ceremony.

Across the English Channel, which until recently gave England her isolation and helped to make her a great sea power, we visit Holland, land of canals and quaint, clean Dutch villages. In Belgium and beautiful Brussels we will be reminded how this small nation resisted valiantly the onward march of the German army in the Great War. Then on to Germany, where we will spend a whole day sailing down the Rhine, with its castles frowning down on the river the same today as they did centuries ago. Remember Bingen on the Rhine? To those in the *American Agriculturist* party such names as "Bingen, Fair Bingen on the Rhine", will be real living facts seen with our own eyes, no longer something dim and far away, only to be dreamed of.

Switzerland, with the majestic Alps and their eternal glaciers glittering in the summer sunshine, will of course be included. From Switzerland, our itinerary takes us to France and Paris, that city of cities, where we will marvel at

two years ago. At last he's got what he deserved."

"Well, that was about the only thing you could do under the circumstances," remarked the Old Squire, judiciously. "That was what they hired you for."

Master Pierson inquired whether he had had any further trouble with Jack Coleman. "None whatever. He and I got on very well after that. Jack wasn't a bad sort. He had got to thinking he could thrash everybody and needed to learn he was mistaken. That was all. He was a pretty good scholar, too. I took him through his Common School Arithmetic that term and gave him a fair knowledge of geography."

Our visitor passed the night with us, but was up and away in the storm, early the next morning. We bought a copy of his "Polar and Tropical Worlds," at four dollars and fifty cents. He cleared, as he told us quite frankly, a dollar and a quarter for each copy he sold. He said that he had sold fifty-one copies during three weeks' canvassing.

Hudson Maxim never came our way again. The impression he left with us was of an unusually energetic youth, a little too self-assertive, perhaps, but straightforward and very vigorous, physically — an impression which his subsequent phenomenal success in life has amply verified.

the Arc de Triomphe, the Tomb of Napoleon, and the large parks, some of which are the most beautiful in the world. From Paris we will motor out to Versailles, ancient home of the kings of France, important also to Americans in modern times because here was signed the Treaty which ended the World War—or did it?

From France we sail for home, on a ship with every modern luxury, and as we turn our faces to our own America we will say with Henry Van Dyke:

"'Tis fine to see the Old World, and travel up and down
Among the famous palaces and cities of renown,
To admire the crumbly castles and the statues of the kings —
But now I think I've had enough of antiquated things.
Oh, it's home again, and home again,
America for me!
I want a ship that's westward bound to plough the rolling sea,
To the Blessed Land of Room Enough beyond the ocean bars.
Where the air is full of sunlight and the flag is full of stars."

The one price of \$497.50 covers all of your expenses from Montreal, including even your tips. As I said at the beginning, we never before have organized such a trip, because we never could get a price, services and itinerary that we could recommend with enthusiasm. But now, through the cooperation of the Canadian Pacific Steamship Line and the Travel Service Bureau of Newton Center, Massachusetts, we have the best European tour for the money that I have ever known anything about. I know of no other way by which you can get the luxuries and service that we will provide on this trip for anywhere near the price. You will be freed from all of the worries, irritations and responsibilities that travellers are usually subjected to. You will have nothing to do but to have a good time, an experience that will last you through all the years to come.

Of course I have only just mentioned a few of the high spots and the things we will see. For a complete itinerary and detailed description, write to European Tour Editor, *American Agriculturist*, Savings Bank Building, Ithaca, New York.

LETTERS

Altona, New York
January 14, 1939.

Gentlemen:

I wish to thank you for your check of \$30.00 which came at a time when I was in need of money having been unable to work for several weeks and bills were piling up.

In appreciation for your prompt service, I shall be glad to recommend your insurance company to anyone I may come in contact with.

I have not fully recovered from my accident but am able to be out around supervising business.

Very truly yours,
E. E. LEAZOTT.

* * *

213 Underwood St., N. W.
Washington, D. C.
January 6, 1939.

Dear Sir:

In an automobile accident a few months ago, I suffered a mild concussion and was kept in bed under the doctor's care for ten days.

I want to thank you most sincerely for your kind consideration and prompt payment of the \$10.00 claim I presented which helped meet my extra expenses at that time.

Am very glad to have had this policy, and assure you my husband, son and I will always keep protection with your company.

Sincerely yours,
LAURA A. BARTON.

* * *

Farmington, Maine
January 13, 1939.

Dear Sirs:

This is to acknowledge the receipt of check for \$8.57 in settlement of my claim for damages I suffered in a wagon-auto accident on November 30, 1938.

Many thanks and best wishes. You can use my name in a future issue of *American Agriculturist*.

Yours truly,
ALNA D. WATSON.

* * *

Penn Yan, N. Y.
January 11, 1939.

Dear Mr. Weatherby:

Thanks for my check for \$50.00 and your prompt, courteous service. My doctor bills will be paid today with this money. Without it, I would have been a long time paying it. In appreciation of your services, you may use this letter as you wish.

Kernels, Screenings and Chaff

By H. E. BABCOCK.

FROM the letters I have been receiving, I feel that I have conclusive evidence that the farm people of the Northeast are doing some mighty serious thinking these days.

TAXES UP — PRICES DOWN

The response to my suggestion that the time has come when farmers must take a definite stand against any increase in real estate taxes has been almost terrifying. This is tax time and apparently a lot of farmers are sore over the increased taxes they are having to pay. *I am myself.* I'm just as sore over the way farm prices are falling. We probably can't do much about the latter situation, *but we can have something to say about taxes.*

ADVANTAGE LOST

Through the agency of the Farm Credit Administration farmers got access, for the first time in history, to capital at reasonable market prices. This advantage accrued to farmers early in President Roosevelt's first term. *Lower interest rates saved individual farmers dollars, and agriculture as a whole millions.*

As I see conditions at the present time, however, all of the savings which accrued to agriculture in the form of lower interest rates, as a result of the work of the Farm Credit Administration, have been wiped out by the increases which have occurred in our real estate taxes.

WE MUST TAKE A STAND

So great is the momentum of public spending, so reasonable on their face are most projects for which public funds are expended, so vitally do these public expenditures touch all of our lives that *it is going to take a super-human effort to turn the tide.*

Every farmer who thinks, however, must realize that there must come a stopping place somewhere along the line. *We have got to take a stand or lose our farms.* Under these circumstances, I, for one, have decided where my stand will be. **THERE MUST BE NO FURTHER INCREASES IN REAL ESTATE TAXES.**

* * *

Lamb Pasture

In connection with our plans for finishing a lot of lambs on our Larchmont Farm next fall, I am trying to figure out a plan for the best utilization of a 20 acre field which adjoins the barn in which we shall feed the lambs.

This field, at the present time, is in sod one year old and it will be top-dressed with manure this winter. Normally we would produce a crop of hay on it, but I am not quite satisfied with the stand of grasses and I am afraid that we have got more hay acreage than we can handle. Also, I want to grow a spring grain on this field in 1940, if possible.

Under the circumstances, I am planning on plowing the field early in the spring, so as to give the manure a chance to break down, and then on sowing it to some crop or crops which the lambs will harvest.

Perhaps the best suggestion I have received to date comes from E. B. Clark of Auburn, N. Y., who, in commenting on the tough time I reported making soy beans into hay, writes:

"I meant to tell you last year you couldn't cure soys, but they make excellent lamb feed. Drill them in rows, 24 inches wide. Cultivate them once or twice. In harvesting them, the lambs follow the rows and there is little waste."

I really would like to hear from any farmers who have grown soy beans to be harvested by lambs and to know what they think of the idea. Also, I would appreciate suggestions from men of experience as to what they would

The sire of the bull we leased, like his dam, is owned by H. B. Wilson, Meadowbrook Farm, Caledonia, New York. He is Cornell Royal Calculator No. 210570. In Mr. Wilson's herd are 27 daughters of this bull, the first eight of which have finished their lactations as two-year olds. Under ordinary farm conditions, and on two milkings a day these heifers have averaged to produce in 295 days 7686 lbs. of milk and 378 lbs. of fat. It seemed to Hank and me that these daughters of Cornell Royal Calculator in Mr. Wilson's herd had about the uniformly best udders of any lot of cattle we saw last summer, although to be sure we did not have the time to inspect too many herds. The bull we are leasing for use in our herd is Calculator's Demonstrator.

put into the 20 acre field I have described, bearing in mind that the field is so shaped that it can be fenced off in sections and that I want the lambs to do the harvesting.

* * *

Practical Ideas

As the days go by, letters pile up on my desk from farmers whom I know to be successful and practical. I plan on passing on to you the ideas these farmers write me, but quite often I find that I fail to do it. Here, however, are a few suggestions which I am passing on because I feel you may find them of value:

SOY BEAN CULTURE

W. S. Carriage, Sweet Farm, Waterloo, N. Y., writes:

"You are not alone in making mistakes growing soy beans. This is my third year and it is the most successful of any. I drilled the beans for two years every hole and went over them with a weeder until a foot high, but the weeds became a pest to harvest with the combine. This last season I had only six acres planted in 35 inch rows. We cultivated them four times. The weeder was used once before they were up and three times afterward. I have a wonderful crop, better than 2½

We spent a good deal of time last summer looking for a bull to use on our pure-bred and grade Guernsey heifers. We first tried to find a proven bull worth the money which could be bought, but didn't run across any, so we ended up by leasing the son of the cow, General's Charming, shown above. This cow has a 334 day lactation record of a little over 9000 lbs. of milk and 450 lbs. of fat under ordinary farm conditions. We chose a son of hers, not only because we liked the cow, but also because of her two daughters, full sisters to the bull we selected. These heifers had fine production records, and like their dam, udders of the very finest shape and quality. General's Charming is owned by H. B. Wilson, Meadowbrook Farm, Caledonia, New York.

seems a trifle too small:

"At the present time the writer has three miles of electric fence and expects to extend it next Spring. There is no doubt that the electric is the coming farm fence and that it will have a marked influence on agricultural and livestock practices. The fence row will be a thing of the past when farmers learn how to construct electric fences and how to use them. Fences will then be permanent or portable as one likes. Three hundred pounds of posts, wire and insulators are sufficient for a mile of fence, excluding corner posts and gate posts."

COOKING BEANS

With cull beans and even sound ones worth practically nothing, farmers everywhere seem to be figuring on feeding them. I know we are at Sunnysgables. Hawver Brothers, Otego, N. Y., have written in about their experience cooking beans. They say:

"You spoke of having set up a cooker to cook beans. Since writing you, we have had a little experience with beans which may possibly be of use to you. First, we tried cooking the whole beans, but this required a lot of time and heat and the hogs did not eat them well. Then, we ran them through the hammer mill, added a little salt and some molasses and then cooked them. We found it took only a few minutes to cook the ground beans after they came to a boil. We hope this may be of some benefit to you."

MUSTARD CONTROL

K. C. Livermore of Honeoye Falls, N. Y., offers me the following on my present hobby of controlling mustard. He writes:

"From local experience, I know that 10 to 15 lbs. monohydrated copper sulphate dusted on oat fields will kill mustard and not kill oats. I presume results would be the same in barley. It might be harmful to corn and probably would be to potatoes and some other crops. By timing the application, one can get nearly all the mustard that would germinate and set seed without the necessity of making a second application.

"Usually it is necessary to repeat this treatment each time the field is in spring sown grain for two or three times, since many seeds will not be near enough to the surface to germinate the first time. Dust applications are more convenient than spray and usually more thorough. Wheel damage to the grain is slight if the application is made fairly early and the ground is not too soft."

ft. high with 20 to 30 pods on a stalk and not an armful of weeds on the whole six acres. It pays to cultivate soy beans as early and as late as one can without doing harm to the root systems."

ELECTRIC FENCES

Miles and miles of electric fencing will be put up this spring. Lots of farmers are already making their plans, so a suggestion or two from Albert D. McNair, of Dansville, N. Y., is quite timely. Writing about electric fences, Mr. McNair says:

"In regard to sheep I agree with Mr. Babcock that, at present, results are not entirely satisfactory. Although I have confined within a two wire electric fence the most rambunctious ram I have ever known, I did it by putting a wire around his neck with an aerial extending 15 inches above the neck. When he attempted to go through or under the wire he literally got it in the neck. . . .

"One thing that I do not like about the electric fences that I have seen and heard about is the 'barbed' wire. Its only advantage is that the point of the barb gets through the hair to the skin and gives a good electric contact, but the disadvantages are great. The writer has used, for three years, a smooth wire electric fence, starting with a No. 14 wire, then changing it to a No. 16 and even a No. 17 wire. However, the latter size

Wanted—A Chance

HERE is a letter from a young man who needs a helping hand. It is all very well to urge those who have made mistakes to start over again, but to do that someone must furnish a job. We feel certain that among our 180,000 subscribers, there is someone who will be glad to do this. Send your replies to A. W., American Agriculturist, Box 367, Ithaca, N. Y., and they will be forwarded to the writer.

"Having no one in the world that I can write to, I just had to write to you. Hoping that after reading this letter, you may be able to help me in some way, I will do my best and explain my case.

"I wish to be frank with you and start from the beginning. Over six years ago I was out of work a year, and tried in every possible way to secure employment of any kind. I just couldn't find anything to do.

"Being broke, down and out at the time, and knowing of no one to whom I could turn to ask help, I lost control of myself and got into trouble. I was arrested in New York City—charge, robbery—and sent up here to Auburn State Prison for from 5 to 10 years.

"I was 20 years old and didn't realize then what I was up against. Now I can see what a fool I've been ever to get myself into trouble. I see my mistake, and during all these years that I've been here (six now), I've had plenty of time to think things over and to make up my mind a long time ago that when I am released from here, I will work hard and make good.

"However, before I can be paroled, I must locate a job. For 3 years I've been eligible for parole. I have appeared before the Parole Board five times, and always have been denied parole because I can't locate employment. The Parole Board told me when I got a job, they would release me—not before. Otherwise, they will keep me here for four more years.

"You can see what I am up against, also what it means to me to find a job. I understand how bad conditions are today on the outside, with millions of people out of work and on relief. How can I, while in a place of this kind, ever expect to find work without someone's help from the outside?

"For the last three years I have written to a countless number of people asking their help. So far I have always met with disappointment. It seems to me that there isn't anyone out there willing to give a human being another chance.

"I'll admit I don't blame anyone but myself for being in a place of this kind. I made a big mistake, and have paid for it dearly. All I ask of anyone is to be given a chance so I can prove to everyone concerned that I can make good when released from here.

"During the last few months I've been getting a lot of old American Agriculturists and enjoyed reading them very much. That's how I happened to write to you. I was hoping and praying that you would

be willing to help me out.

"I wish to be truthful and say that I've never been on a farm in all my life. Have been interested in farming, and also studied about it a great deal. If given a chance, I would like to work on a farm, because I don't care to go back to the place I came from. I would be only too glad to work for just my room and board. Later on, after I learned about farming, they could pay me for the work I put in.

"I was born and raised in New York City, of German and Polish decent. I am 26 years old, in good health, never drink, am a hard worker, and always willing to learn. If there is anything you care to know, please write and I will gladly answer any questions asked."

All the Traffic Will Bear

"What can you tell me about the..... Company. An agent called and tried to get me to sign a contract to reshingle my home with white asbestos shingles. Before I sign I would like to know whether or not they are reliable."

In this case, we think you would get a better deal from a local contractor. We are omitting the name of the company because they are operating entirely within the law. The most damaging information we have is that agents who get orders are hired on a sliding scale of commission from ten to twenty-five per cent, depending not upon the size of the order but on the price for which this order is sold. Therefore, it is to the interest of the agent to charge as much as he can get and not to give the customer the very best deal. We feel that it is best to compare prices in your own town to get the best possible price.

The Other Side

In the January 7th issue we reported that a Postal Fraud Order had been issued against the Columbian Music Publishers, Toronto, Canada. We have been asked by Columbian Music Publishers to bring this information up to date, and we are glad to do so at this time.

On November 16 the U. S. District Court for the District of Columbia issued a temporary restraining order which prevents the operation of the Fraud Order issued by the Post Office Department. On December 16 Justice Cox continued this restraining order pending appeal to the U. S. Court of Appeals of the District of Columbia. In plain English, this means that pending court decision, the Columbian Music Publishers can use the U. S. mails.

Commenting on the situation, Columbian Music Publishers state:

1. That when first visited by U. S. Post Office Inspectors, they had been in business only six months and, therefore, it was natural that royalty payments at that time were not large.

2. That it is to their credit that they are able to obtain music arrangements at low cost.

As is our usual practice, we are glad to present the other side to our readers.

Unordered Merchandise

"I have received letters from a refining products company of New York City, trying to interest me in a product called Scalemeny Water and Metal Treatment. Without ordering any they shipped me a drum of the product which I had to ship back, after which they threatened to sue me for the money. Now I have a second letter, acknowledging with thanks my order for a two hundred pound drum of the product. I sent no such order. I thought this might be of interest to your readers."

The proper thing to do on unordered merchandise sent you is to refuse to accept it. Occasionally a customer signs an order without realizing what he is signing, therefore it is important to use care in attaching your signature on any paper.

JACOB B. BILL, JR.
Deceased

THIS young man, 19 years old, was killed December 22 when the car in which he was riding got out of control and crashed into the ditch.

Mr. E. C. Weatherby, Gen. Agt.
Ithaca, New York

Dear Mr. Weatherby:

We are writing this letter to you to express as best our words can the feeling of gratitude we have for you and the company you represent.

Perhaps you do not know that it was just 23 days before our son was killed in a terrible auto accident, that one of your salesmen gave us the opportunity to have this most wonderful protection at a cost that enabled us to have a policy for each member of the family.

Of course, no amount of money could stop one bit of sorrow we have to bear, yet the check for \$1000.00 which came through so promptly is a source of great help in taking care of the many bills that must be met at such a time.

You are at liberty to use this letter any way you wish if by its use other parents can be induced to have their children carry this wonderful insurance.

Again thanking you, we are

Sincerely

Mr & Mrs Jacob B Bill

**COW OF THE YEAR**

Cornell Ollie Catherine 1501460, National Grand Champion, All-American Aged Cow and highest producer for 1938 with 29333.8 lbs. milk and 1156.6 lbs. butterfat. Highest record cow ever to win Grand Championship at National Dairy Show,

Announcing G.L.F. SUPER TEST FEED

16% PROTEIN

**Famous Record-Making Cornell Test
Ration Now Available to G.L.F. Patrons**

The cows shown here made their records on Cornell Test Ration, now available to G.L.F. patrons as Super Test Feed.

BROWN SWISS—Orpha A produced 22923 lbs. milk containing 900.29 lbs. butterfat in mature class. Sixty-seven production records in the Cornell University dairy herd on all dairy breeds and all ages average 16385 lbs. milk and 675 lbs. butterfat. Twenty-three were 305-day records; 24 were made by two-year-olds, 16 by three-year-olds, and 12 by four-year-olds.

AYRSHIRE—Cornell Ruel Ayr produced as a 3-year-old in 305 days 12955 lbs. milk containing 542 lbs. butterfat—fourth place in her class. As a four-year-old she produced in 305 days 14068 lbs. milk containing 613 lbs. butterfat—third in her class and winner of the French Cup.

JERSEY—Ixias Oxford Star produced in 305 days as a junior three-year-old 9987 lbs. milk containing 520 lbs. butterfat qualifying for Silver Medal. A stablemate produced 738 lbs. butterfat as a 3-year-old, thus qualifying for the Gold Medal.

G.L.F. PATRONS may now secure, ready-mixed from their own mills, the famous Cornell Test Ration. Rarely if ever has a feed been made available to dairymen with such a record of results behind it.

In the Cornell University herd and on dairy farms throughout the Northeast this feed has been producing class and world records for years. It is now being furnished by G.L.F. mills in response to a growing demand for a 16% Super Feed by dairymen who have first quality roughage and are feeding for production records.

Molasses is Included

Super Test Feed is identical with the Cornell Test Ration except that it contains 100 pounds cane molasses per ton, whereas the molasses is fed separately with Cornell Ration. Here is the open formula:

200 lbs.	34% Protein O. P. Linseed Meal
360 "	Wheat Bran
	(may contain mill run of screenings)
340 "	Hominy Feed & Corn Meal
370 "	Ground Oats
300 "	Corn Distillers Dried Grains
300 "	20% Protein Coconut Oil Meal
100 "	Cane Molasses
20 "	Steamed Bone Meal
10 "	Salt

2000 lbs. SUPER TEST FEED

GUERNSEY—Eminent's Golden Rod produced 13052.9 lbs. milk containing 767.5 lbs. butterfat as a three-year-old in Class DD. This was seventh highest record for the breed in the class when made and highest record for the year in New York State.

Experience shows that this formula keeps cows in splendid condition and "bloom." Even very high producers eating large quantities of grain will not tire of it or go off feed.

Super Feeds for Super Cows

This new 16% fixed formula feed is a companion feed to Super Exchange Dairy 20% and Super Milk Maker 24%, which have also produced many world's records. Like them it is intended primarily for very high producing herds and for cows on test, and for dairymen who prefer to feed the same formula the year round.

Most dairymen will continue to find their most practical and economical feeding program in the use of one of the approved flexible formula feeds. Equal in quality of ingredients to the super feeds, these feeds cost two to three dollars per ton less because they take advantage of changes in the price and supply of various ingredients.

In this Corner

"Wife vs. Mother" is the dangerous theme tackled by Rym Berry in the forthcoming G.L.F. PATRON. This is one of 15 feature articles by such writers as H. E. Babcock, Lucile Brewer, and Professor Savage. Watch for it about the middle of March.

Can you raise a yearling heifer for \$33 feed cost? Ernest Rathbun of Unadilla, N.Y. can and does. Mr. Rathbun has a string of yearling and two-year-old purebred Ayrshires raised by the G.L.F. Calf Starter method. He says he can raise a well grown 500-pound yearling by this method with less trouble and less cost than any other way.

When snow drifts are deep, manure piles up in the shed. Where to spread it when the weather breaks—corn land or grass land? This is the time to figure out whether you'll make corn silage or grass silage next summer. Each year more and more farmers are making grass silage with cane molasses or Silo-Phos. G.L.F. Service Agencies have 'em both.

FRUIT *for the* *Home Orchard*

THE GROWING of fruit for home use has not received the attention that its possibilities for contributing to farm living and enjoyment of life deserve. There is real satisfaction in having available throughout the season an abundance of high quality tree-ripened fruits of all kinds. Besides being healthful, they have great possibilities in the kitchen, as any housewife is aware. Children, too, appreciate a constant supply of the different fruits, and one of the delights of childhood is gathering and consuming a few fruits when hungry.

If fruit is grown and consumed in the amounts desirable in a well-balanced diet, the home orchard will justify its cost. In many cases enough surplus may be sold to neighbors to pay for the fertilizer and spray materials. The purpose of this article is to indicate a succession of reliable varieties which will enable the family to enjoy a continuous supply of home-grown fruit throughout the season.

King of fruits is the apple, because of its great usefulness in the kitchen and as a dessert fruit for at least eight months of the year. A succession of varieties is needed to provide fruit during summer and early fall. With the early varieties which ripen quickly and do not keep well, several may be grafted into one tree. One good-sized branch in a tree will provide all the fruit that can be used before the next variety is ripe.

Lodi, which is essentially a larger and more productive Transparent, starts the apple season in early August. Next in season is Early McIntosh, a bright red, high-quality offspring of McIntosh which it resembles. Milton, another McIntosh type, ripens in Wealthy season, or a month earlier than McIntosh. Two good fall cooking and baking apples are Twenty Ounce and Fall Pippin, both old favorites and well-known to farm housewives. Standard dessert apple of late fall and early winter is the McIntosh. Ripening a little later and keeping slightly better is Cortland, fine for dessert as well as the kitchen.

Rhode Island Greening, perhaps the most useful apple in the whole list, is still the standard winter cooking apple. Another old favorite, valuable for dessert as well as cooking, is Northern Spy. If a winter sweet apple is desired, Sweet Delicious is as good as any.

* Dr. Slate is specialist in charge of small fruits at the New York State Agricultural Experiment Station at Geneva.

by G. L. SLATE *

Dolgo is a fine crabapple, useful for jelly and pickling, and profuse bloom and bright red fruits make it worthy of a place near the edge of the lawn where its beauty as well as its utility may be enjoyed.

When it comes to pears, Tyson is a choice little summer variety of good quality and fine tree characters. Standard and first choice is Bartlett, followed by Gorham which is of the same general type. Seckel is choicest of all in flavor, and has a blight resistant tree as well; Beurre Bosc, though having rather a weak tree, produces a superb fruit. The winter

The Gorham pear follows Bartlett in season.

The Stanley plum is very productive and of good quality.

pears possess serious faults, but Anjou and Winter Nelis are suggested to extend the season.

Peaches are a favorite with everyone and easily grown. Mikado, ripening in early August, opens the peach season. Coming along in mid-August is Oriole, a very pretty little peach of good quality. Golden Jubilee follows Oriole and Vedette is a few days later. In season with Vedette, but white-fleshed and of superior quality, is Cumberland. Halehaven, a new variety of South Haven season, is so promising

that it is recommended even though not extensively tested. An old favorite, valued chiefly for its high quality, is Champion, a white-fleshed variety. Elberta winds up the season with a big crop that must tree-ripen to be had at its best. This is the peach to can.

The nectarine, "a peach with the skin you love to touch", or a fuzzless peach, is an interesting novelty with the same cultural requirements as the peach. Sure Crop, a white-fleshed variety, is best.

Plums are useful for canning and for jam and the best varieties are superb dessert fruits. Japanese varieties are earliest, with Beauty and Abundance opening the season. Less hardy than other plums is the tree of Beauty. The first real high quality plum is Washington, a European type of light yellow color and a rich flavor. Imperial Epineuse is very sweet and cans well. Best of all for canning and excellent for eating when dead ripe is Italian Prune, often sold as Felleberg. A good blue plum ripening with it is Stanley. Reine Claude closes the season, hanging long on the tree in the cool October weather. Room should be found for a Shropshire damson, which makes excellent preserves and jam.

Sweet cherries are doubly welcome, first, for their high quality, and second, for their earliness, Seneca ripening in early June in an early season. It must be protected from the birds. Black Tartarian, an old dooryard favorite, ripens ten days later, (Turn to Page 13)

For Important Court Decisions on Milk Marketing Orders See Page 5.

You're looking at some "Railroad Implements"

AMERICAN farmers have three and a third billion dollars invested in "farm implements," such as plows and harrows, cultivators, tractors and combines.

Now the railroads have "implements" too. You know them as box cars, cattle cars, passenger cars, locomotives and things of the sort. And the railroads have about five and a half billion dollars invested in such equipment.

You might think, with this investment, that new purchases would hardly be needed.

But it's just like farming. And with all their implements, American farmers bought half a billion dollars worth of new equipment in 1937.

So, the railroads, in order to keep abreast of the times, must also buy new "implements." In the past ten years ending with 1938, they spent an average of about 165 million dollars per year for additional equipment.

This money has brought several advantages to shippers such as you. It has increased the pulling power of locomotives, for instance,

17%. It has helped to increase the carrying capacity of freight cars. It has played a part in increasing the speed of freight trains 50%.

But the railroads' job, like that of the farmers', is never finished—and if the railroads are to keep on doing the best all-round transportation job in the world they need to keep on replacing old "implements" with new ones. If they had the money they could spend to advantage at least one half billion dollars a year for the next five years just for new "railroad implements."

All of which means, the railroads need a fair chance to earn a living, so they'll be in good shape to move farm products to market when you want them to go.

A program of Federal and State legislation looking toward giving the railroads that fair chance to earn a living is outlined in a recently published booklet called, "For Better Times—A Square Deal in Transportation." Write for a copy.

The TOWN MEETING

We Still Need It

By **MARK SMITH**

Supervisor, Town of Hector, Schuyler County, N. Y.

"Yet all the while in secret, without sound,
The fat worms gnawed the timbers underground.
The twisting worm whose epoch is an hour,
Caverned its way into the mighty tower;
And suddenly it shook, it swayed, it broke,
And fell in darkening thunder at one stroke.
The strong shaft with an angel on its crown,
Fell ruining; a thousand years went down.
And so I fear my country, not the hand
That shall hurl night and whirlwind on the land;
I fear the vermin that shall undermine
Senate and citadel and school and shrine—
The worm of greed, the fatted worm of ease,
And all the crawling progeny of these—
The vermin that shall honeycomb the towers
And walls of state in unsuspecting hours."

NO QUESTION will arise in the minds of thinking people with regard to the real meaning of Edwin Markham as expressed in the foregoing lines. Centralization of power is today menacing many of our old fundamental institutions of local government. The desirability of preserving the old township unit of local government is the main subject to be dealt with in this article.

Toulmin Smith in 1851 said: "Local Self Government is that system of government under which the greatest number of minds, knowing the most, and having the fullest opportunities of knowing it, about the special matter in hand, and having the greatest interest in its wellworking, have the management of it, or control over it." Also that "Centralization is that system of government under which the smallest number, and those knowing the least, and having the fewest opportunities of knowing it, about the special matter in hand, and having the smallest interest in its wellworking, have the management of it, or control over it."

Do we—nowadays—fully appreciate our township form of government? My boyhood recollection is that men, talking to my father and referring to our town of Hector, spoke with greater pride and respect than is usual today. Our Town—ten miles square—containing nearly one-third of the two thousand acres in the County of Schuyler was often spoken of as the State of Hector. As Supervisor for the past three years, I have been afforded an opportunity to study, first hand, the operation of this large town which had its first town meeting in 1802, and to observe the strength and value of this old institution.

Experience and observation lead me to say that we should be alert to use every effort to retain and preserve the principles of this old type of local government. This is the day of the political and professional reformer and their motives are not always to be trusted from our standpoint. Whenever the word REFORM shows up with regard to town and county government it is time to be on guard because some old valued heritage may be in jeopardy. The interests of the metropolitan area and those of the up-state section are not always identical.

Loss of local power or control and greater expense are two almost inevitable results of reforms in local government set-ups. A high authority has been quoted as saying that the township unit is the most efficient and economical unit of government now in use.

The town board is the policy-making

body of the town and administers the affairs of the town. The local town unit protects the health, the person and property of the citizens, administers relief and maintains the highways. The local school districts provide education—thus the fundamental needs of the people are supplied by the local units of government. The town board is answerable to the electorate which is the true fountain-head of local government. The town clerk and assessors may be elected or appointed. The work of Collector may be done by others. Great care should be exercised in the selection of the Justices of the Peace because today, with the increased demands of the people, their position is of increasing importance.

In our town, instead of the usual four, we have five Justices of the Peace. The responsible nature of the Justices' position has been mentioned, yet in our town the total per diem pay of the five Justices in 1938 was \$292.00.

I am indebted to the Secretary of the Association of Towns for information regarding a case of county reform which shows how it is apt to turn out. In a certain county of the state of New York the office of Justice of the Peace was abolished in the towns of the county. The total combined salary of the Justices of the Peace per year was \$3,500.00. Under the new charter a district court was established with six Justices who receive \$8,000.00 each per year.

As chairman of a town board, I have come to have complete respect for the collective judgment of the Justices with regard to matters of town business which come before the board. Our board consists of four farmers and a garage owner who is also a farmer. Much of the time of our monthly sessions is spent in reviewing and auditing the bills for home relief. A town public welfare officer's order is actually and legally final yet it relieves the welfare officer somewhat to have these bills discussed and audited. Home relief in our town for 1938 amounted to \$18,177.98. The taxpayer's viewpoint is really the deciding viewpoint in the last analysis. The citizen of a community is the most important thing in a community. If local control is to be retained, efficiency will have to be the main consideration. There is nothing that disgusts the substantial citizen like the existence of petty politics. Sometimes in county affairs officers imagine they are the county if they are allowed to stay in office too

How Is Your Soil Fertility BANK ACCOUNT?

A Contest With \$60.00 in Cash Prizes

EACH SPRING for the past two years we have offered a Seed Contest for readers. They were so popular that we had many requests for another contest, so here it is.

This year we are calling it a Soil Fertility Contest. Don't fail to enter it. It is interesting to find out how many things we think we know until we come to write them down. This contest will give you a fine opportunity to test your knowledge, to gain more knowledge, and to win either the \$25 first prize, one of the other cash prizes, or one of the merchandise prizes offered by our advertisers.

The important thing is to start at once by ordering some of the catalogs and booklets offered by seed and fertilizer companies, by writing to colleges of agriculture or the U. S. Department of Agriculture for bulletins, and perhaps by borrowing or buying a book or two on soil fertility. Incidentally, you will find the answers to some of these questions in back issues of *American Agriculturist*.

We suggest that you write to the Mailing Room of your College of Agriculture and either ask them for copies of available bulletins on soil fertility or ask for a list of available bulletins, from which you can choose those which you feel would be helpful. The U. S. Department of Agriculture commonly makes a charge of 5c each for farmers' bulletins, but they are worth it. Drop a post card to the U. S. Department of Agriculture, Washington, D. C., and ask them to send you a list of available bulletins, from which you can make your selections. If you do not already have a reference library, this will be a good way to make a start.

There are a number of excellent books on soils and soil fertility. One is *Farm Soils* by E. L. Worthen, published by John Wiley & Son. Your local bookstore will be able to get it for you if you would like to own a copy. Also there are: *Soil Science* by

YOU May Be the Winner

For the best answers to questions on this page, **AMERICAN AGRICULTURIST** will give the following prizes:

- First Prize \$25.00
- Second Prize 10.00
- Third Prize 5.00
- 20 Prizes of \$1 each

In addition to these cash prizes, merchandise prizes will be distributed to those sending in the best answers.

W. W. Weir, published by the J. E. Lipincott Co.; and *Fertilizer and Crop Production* by Van Slyke, published by the Orange Judd Co.

Here are the questions: Answer 12, including No. 14 which MUST be answered. Because northeastern farming is so diversified, we have felt that it is not fair to ask that you answer questions about crops which you do not grow. Hence the choice of questions.

CONTEST QUESTIONS

(Answer 12 including Question 14)

1. What are "quick soil tests"? How useful are they?
2. In fertilizing potatoes, where should the fertilizer be placed in order to get the best results from it?
3. How is 29-3 seed corn produced?
4. If some alfalfa seed were offered to you containing some red seeds, would you buy it? Why?
5. How should farm manure be handled in order to prevent loss of fertility?
6. In what ways does humus (organic matter) increase the fertility of soil?
7. In what ways can pastures be improved?
8. Where orchards are in sod, how should they be managed and fertilized in order to maintain soil fertility?
9. When is the best time to cut hay and why?
10. One of two materials is commonly added to grass when put into the silo. Why? What are they?
11. Name ten elements that are essential for plant growth.
12. What are the distinguishing characteristics of the legume family?
13. What are some relatively new va-

(Continued on Page 15)

THE RULES

1. Contestants must live on a farm or grow a garden.
2. No member of a family connected with *American Agriculturist* is eligible. Also ineligible are County Agents, and teachers of agriculture in high schools and colleges.
3. All entries must be postmarked not later than March 27. Address entries to Soil Fertility Editor, *American Agriculturist*, P. O. Box 367, Ithaca, N. Y.
4. The editors of *American Agriculturist* will be the sole judges of the contest. Entries will be judged on accuracy, neatness, and on the amount of reference material read. Write on one side of the paper only.
5. Winners will be announced in the April 15 issue.

UREA

REA NITROGEN—HAS ALL THREE OF THESE DESIRABLE QUALITIES:

RESISTANT TO LEACHING.
It "stays put." Effective in wet weather.

EQUIVALENT ACIDITY LOW.
Most crops respond best to nitrogen from a non-acid-forming or only slightly acidic source.

AVAILABILITY COMPLETE.
It's 100% available to the crops fertilized.

... IS TRIPLE-PLUS NITROGEN

When the plant food in a fertilizer has the foregoing three properties, you can be sure it will give good results with a wide variety of crops, soils, and seasons. Almost without exception, the phosphoric acid and potash in your fertilizers possess these three properties, and are therefore rated as Triple-Plus plant foods. *But how about Nitrogen?* Check your fertilizer against this table:

	YOUR FERTILIZER		
	Nitrogen*	Phosphoric Acid	Potash
Completely available	?	+	+
Leaching resistant	?	+	+
Low equivalent acidity	?	+	+

*You can insert the word "Urea" here, and substitute plus (+) signs for the question marks.

Du Pont UREA NITROGEN rates (+) on all three. That's why we call it the Triple-Plus Nitrogen. That's why manufacturers are using more and more "URAMON" and Urea-Ammonia Liquor in their complete fertilizers. That's why more and more growers who apply nitrogen only to fruit, haylands, pastures, and other crops are turning to "URAMON," the semi-granular, Triple-Plus, high-nitrogen fertilizer, which is free-flowing, easy to handle and apply. Write for booklet "Urea—Triple-Plus Nitrogen."

ASK FOR FERTILIZER MADE WITH

UREA NITROGEN

"URAMON" Fertilizer Compound
Reg. U. S. Pat. Off. (42% Urea Nitrogen)

Urea-Ammonia Liquor
(45% Nitrogen)

The Way to Stop Raising Taxes

TO PROTEST largest state budget in history of New York State, and to demand a reduction in the state's ever-increasing tax burden, more than 7,000 persons representing 292 citizens' organizations appeared in Albany on Washington's birthday before a joint meeting of the Senate Finance Committee and the Assembly Ways and Means Committee.

The movement was sponsored by the Westchester County Taxpayers' Association and the Citizens Public Expenditure Committee. Represented were taxpayers and civic organizations, home-owner and rent payer groups, community clubs, farm organizations, and cooperatives, women's and mother's clubs, rotary, lions and other service clubs, youth welfare groups and others of similar character.

The "forgotten man" in this America of ours today is the taxpayer, and it is a healthy sign that he is getting up on his hind legs to protest against the ruinous taxes. Real estate owners, including farmers, are also tremendously interested in the present state budget, because Governor Lehman has proposed an extra real estate tax of \$1 per thousand on the assessed valuation of real estate. Real estate just cannot stand any more taxation. We are fast getting to the situation where the last thing in the world that a man wants to own is a home or a farm, because of the tax situation.

On the other hand, Governor Lehman and the State Legislature and government officials in other states have my sympathy. They are on the spot, for it is the citizen himself who is mostly to blame for this tax situation. He is the one who has insisted on more and more government, and the officials are simply carrying out the wishes of the voters. "You can't have your cake and eat it." The way to stop the increasing taxes is to stop asking for so much government service.

Attention, Dairymen!

NO DAIRYMAN interested in the present or future of his business should miss reading the article on the next page, describing the adverse court decisions on the Rogers-Allen Act and the milk bargaining agencies. These decisions are a serious blow to the dairy farmer.

But the situation can be met successfully if dairymen will inform themselves of the facts and continue to act together.

Hired Labor Problem Increases

EVEN in these times, when so many people are on relief, it grows more and more difficult for farmers to get hired help at wages which they can afford to pay. Men just will not work for farm wages when the prevailing rate in every other occupation is higher.

Although farm wages declined slightly in 1938 in New York, and probably throughout the Northeast, they are still high in comparison with prices farmers received. In the fall of 1937 and 1938, farm prices fell below pre-war prices, but farm wages declined only to a point 25 per cent above pre-war wages. This trend seems likely to continue.

We have had hundreds of letters from farmers and their hired men on the labor situation. From these letters I have drawn two conclusions. First, many farmers will reorganize their business to get along with less help. This will mean more labor saving machinery and a better layout in fields and barns to save work.

A possible second way to meet the labor situation is to go into some kind of a profit-sharing

deal with a good man or good men, which will give him or them a little personal interest in the business.

The Apple Growers' Problem

LOOKING back over the past 15 years, apples on New York and other northeastern farms have paid fairly well as compared with other crops. But there has been a fairly steady decline in price returns for apples.

According to Agricultural Outlook, published by the New York State College of Agriculture, production has varied from 117 million bushels in 1936 to 211 million in 1937 and 130 million in 1938. It is expected that there will be a relatively larger crop in 1939.

During the ten years from 1925 to 1935, the number of apple trees of bearing age in the United States decreased about one-fifth, but during the past thirty years yield per tree has increased on an average of about 1 per cent per year. Comparing the decrease in the number of trees with the increased yield per tree, the normal apple crop may be expected to decline from the present 155 million bushels to 140 million bushels in 1945. That is a favorable factor. So also is the fact that Great Britain has reduced its import duty on apples by one-third.

On the unfavorable side is decreasing consumption, owing chiefly to the tremendous increase in the production of citrus fruits, and the efficient efforts to advertise and sell these fruits. Oranges are now more common on many tables than apples. While I like oranges, I do not believe there is any reason for this except that the apple growers have not done as good a job of marketing as have the citrus people. Is it not time for apple growers to consider seriously, how they can stop the declining market and prices for apples?

Why A. A. is Reliable

A lion met a tiger
As they drank beside a pool.
Said the tiger, "Please inform me
Why you're roaring like a fool?"
"That's not foolish", said the lion,
With a twinkle in his eyes,
"For I am called the King of Beasts
Because I advertise."

A rabbit heard them talking,
And he ran home like a streak,
He thought he'd try the lion's plan
But his roar was but a squeak;
A fox came to investigate,
Had luncheon in the woods,
The moral: When you advertise
Be sure you've got the goods.

THE ABOVE was sent me by Mr. D. W. Phelps of Bridgewater, New York, who says that he uses it to advertise his A-I fresh eggs. He says, "You can use it to advertise A. A. Why not, for you have the goods."

Into my office the other day came Mr. Ingalls, our advertising manager, with an offered advertisement which, if we had accepted it, would have brought \$1,000 and possibly \$2,500 additional revenue to the paper. In these hard times, publications have their troubles just the same as farmers do, and could we have accepted that money it would have meant much to us, and enabled us to turn more money over to the *American Agriculturist* Foundation to be used as loan funds to help farm boys and girls get an education.

But Mr. Ingalls and I agreed without question to refuse the advertisement. It was an advertisement of seeds, and our information is that the

seeds of this company are not reliable. We could not tell the farmer in our editorial columns to buy good seed and then advertise something inferior in our advertising columns.

We could have many more thousands of dollars of income in advertising each year if we accepted all advertisements without question, but *American Agriculturist* advertisements are guaranteed. If the advertiser does not make good, we will. All we ask in return is that when you buy, you consult our advertising columns, then get your supplies either directly through our advertisers or through your local dealer who handles the supplies advertised in our columns, and please be sure to mention that you saw the advertisement in *American Agriculturist*. If you do this, you will be assured first of guaranteed products; second, you will be helping to make your farm paper better; and third, you will be helping farm boys and girls get an education.

Farm and Home Week

MORE than 14,000 farm folks attended Farm and Home Week at the New York State Colleges at Ithaca in spite of bad weather and bad roads. One is moved to wonder why so many people make such a tremendous effort to listen to the lectures. The answer is that people are seeking, as they never have before, information on how to make a living and to live.

The enormous demand for bulletins, the thousands of letters that we of *American Agriculturist* receive asking for information, and the large attendance at all business meetings of farmers are additional evidence.

Give the American people the facts and they will make the right decisions, and it certainly seems as if the people are determined to have the facts.

Eastman's Chestnut

MORE than 25 years ago, when I was a teacher of agriculture, a great controversy raged among fruit growers over whether an orchard should be cultivated or have sod mulch. Most growers then believed in cultivation. Grant Hitchings of Syracuse insisted that sod mulch was the better way.

Time proved that Mr. Hitchings was right, for many types of soils. Time proved also that he was right in other ways as a farmer and a man. So the other night, he and Mrs. Hitchings stood before the Governor of the State and received the *American Agriculturist* Master Farmer Medal.

Among his other qualities, Mr. Hitchings has a sense of humor, as indicated by the following chestnut which he sent to me:

"This story was told to me by a young fellow from Winston-Salem, North Carolina, who had a very interesting southern drawl. Of course it is impossible to recapture a southern drawl on the printed page, but it does add considerable to the story.

"It seems this particular farmer had a nice block of apple trees about twenty years old, which needed trimming very much. He was a little too old to enjoy climbing around in the trees and wondered how he was going to find a man to help him. About this time, as he was starting to town, a stranger came along the road inquiring for work. The farmer asked him if he understood trimming an apple tree.

"The stranger said, 'Oh yes, I have done that many times.' The farmer decided to let him have a try at it. He brought out the tools and showed him the trees, and left on his trip to town. On arriving home at noon he asked his new man how many trees he had trimmed. The man said, 'I didn't trim any this morning. I cut the trees down and thought I would trim them this afternoon.'"

"YES"—"NO", Say Judges on MILK MARKETING ORDERS

Boston Order Ruled Constitutional— New York Order Unconstitutional

COURT DECISIONS on milk marketing agreements have, during the past few days, come with breath-taking rapidity.

First came the decision of Judge Francis Bergan of the N. Y. Supreme Court at Albany affecting the Buffalo area. He declared unconstitutional the methods of price fixing and equalization provisions of the New York State Rogers-Allen Law.

The following day Judge Frank Sweeney of the U. S. District Court at Boston handed down a decision **upholding the constitutionality** of the Federal Marketing Agreement Act of 1937 and the validity of the Boston Milk Order issued under that Act. An overwhelming majority of dairymen shipping milk to the Boston market will applaud the decision and consider it a great victory. Dealers will appeal the decision to the U. S. Supreme Court. Meanwhile the Boston market plan is in successful operation and getting results in better prices.

But that is not all. The next day, February 24, Federal District Judge Frank Cooper held unconstitutional the Federal-State Milk Marketing Agreement for the Metropolitan New York area, making the score two to one against milk marketing agreements unless, on appeal, some of the decisions are reversed.

No one can predict with certainty what effect these decisions will have. The first result is gloom among practically all New York State dairymen. Last fall 87 per cent of the dairymen voting favor-

ed the order, and many who were lukewarm about it last September, have become enthusiastic supporters since they have seen the dollars and cents results. The vote on the Buffalo order was even more favorable. Dairy organization leaders are fearful that the next result will be a trend toward chaos in milk marketing. It WILL BE unless dairymen forget all differences and stick together. During the past year they have done this to a remarkable degree, and now is no time to retreat.

To what can New York State dairymen turn at this moment? They still have the main provisions of the Rogers-Allen Law, permitting cooperative associations to work together. You will remember that the Federal-State Marketing Order was put into effect at the request of dairymen, and the order itself was written through

Dairymen Will Fight If They Have To

By E. R. EASTMAN

NOT SINCE those memorable days of the great 1916 milk strike have dairy farmers been so aroused and determined as they are now. Unless the milk dealers are quick to recognize this unanimous and determined spirit of dairymen, a general milk strike is unavoidable. Perhaps it should come now. Conditions have been brewing for a long time toward a showdown to see whether dairymen are going to run their own business or have it run by milk dealers, aided and abetted by the anti-farm gang, led by a farm paper publisher, and by some lawyers who have fattened for years by stirring up strife and dissension in the milk business.

Farmers are law abiding. Of course they will not take exception to the adverse court decisions explained on this page, except to appeal them, but they know that their milk is their own and they have come to the end of the road on the policy of selling it at starvation prices! While the court decisions are being appealed, farmers will not let their market go to pieces, so they are coming together in great mass meetings attended by thousands, to prepare to carry out voluntarily the principles of the Milk Marketing Agreement and to unite on a program, the chief principle of which is that no dealer shall get a single drop of milk who refuses to pay the full prices set up in the Marketing Agreement. I know from the thousands of letters I have had from dairymen lately that the dealer who refuses to pay this living price for milk will get no milk, nor should he. It's time to stop fooling!

I offer only one word of caution. Some of the dealers have tried to play square; they have lived up to the Agreement which they signed and will continue to do so. In the feeling of indignation sweeping the state, let's be careful to play fair.

Let no farmer be dismayed or discouraged; you and your cooperatives have developed the machinery for working together during the past year. As a result, you have had better milk prices. No one can take from you this knowledge that you can stick together and work shoulder to shoulder with your neighbor. Continue to do so through this crisis and be assured that if you do, you will get a price for your milk that will pay your expenses and will leave something over for your wives and children.

secured temporary injunctions restraining the Producers' Bargaining Agency, Dairymen's League and several individuals from persuading Cooperatives to withhold milk from certain dealers. They overlooked one thing, dairymen are aroused and continued to divert their milk, some hauling it as far as fifty miles. In this action lies the dairyman's strength.

Events leading to the decision which concerns
(Continued on Page 12)

What Dairymen Demand!

Several thousand dairymen, assembled in Syracuse on February 27, made a definite demand on New York City milk dealers. Producers asked that dealers sign by midnight, Saturday, March 4, contracts containing the essential provisions of the Federal-State Milk Marketing Order. "If you don't", the producers said, "you will get no milk Sunday morning."

By resolution, dairymen stated that ALL producer groups and all handlers should enter into a voluntary agreement ratifying the terms of the Marketing Agreement, and continue to carry out its terms and provisions.

Another resolution expressed sympathy to the family of Charles Arthur of Lowville, N. Y., a member of the Resolutions Committee, who died suddenly while at the meeting.

Nine big regional dairy meetings are being held March 1 at eleven A. M. in the cities of Watertown, Malone, Utica, Granville, Olean, Elmira, Goshen, Cortland, and Delhi.

the cooperation of men representing both state and federal governments and representatives of the dairy organizations. At that time the hope was expressed that ultimately dairymen would be able to handle the situation without government assistance. The necessity for doing this, at least temporarily, has come sooner than anyone had expected, and before the tremendous force of dairymen has become fully organized. But be that as it may, the job MUST BE DONE unless dairymen are willing to allow prices to drift back to the depths of last August.

Cooperative members of the Producers' Bargaining Agency have been getting in some effective work. A number of New York City dealers refused to pay sums due into the equalization fund on milk purchased during January. "All right," the cooperative said, "then you get no milk!" Producers argued: "Why sell our milk to dealers who refuse to cooperate in keeping some order in the dairy industry?"

This diversion of milk worked so well that some dealers sought ways of throttling it. They

Principles and a Program Discussed and Agreed Upon at Syracuse Mass Meeting of Dairymen on February 27, 1939

- 1—Unless something is done immediately to meet the present milk marketing emergency, prices to farmers may be expected to decline from fifty cents to one dollar per hundred including those for February milk.
- 2—DAIRYMEN OWN THEIR MILK! They cannot be told what to do with it.
- 3—All dealers have signed an agreement with Henry A. Wallace, Secretary of the U. S. Dept. of Agriculture, which has the force of a contract to pay the prices set up in the Marketing Order. This agreement still stands and has not been overruled by the Courts.
- 4—Dairymen, therefore, will rally around this agreement and will stand unanimously in enforcing this agreement to make dealers pay living prices for milk. Any dealer refusing to abide by his agreement and contract will get no milk.
- 5—Regional and local mass meetings will be held throughout the milk shed immediately to keep dairymen informed so that they can follow a program of action.
- 6—Neither individual dairymen nor their cooperatives should sign any agreement or contract with dealers until a program has been worked out, and an agreement reached for concerted and effective action.

VEGETABLES are greedy feeders on potash. Not only is plenty of this plant food necessary for high yields and good quality, but for improved flavor, appearance, and carrying quality so important in realizing profits on competitive markets. Potash also gives the plants more vigor and increases their resistance to diseases and frosts.

The best analysis to use varies with soil and cropping conditions. Complete fertilizers usually are required. To make sure your crops get enough potash, use fertilizers containing at least as much

potash as phosphoric acid. On many sandy soils, peats, and mucks, the potash should be up to double the phosphoric acid.

Consult your county agent or experiment station regarding the fertility of your soil. Ask your dealer about fertilizers high in potash. You will be surprised how little extra it costs to apply enough potash to insure high yields of good quality.

Write us for further information and literature on fertilizing your crops.

FIGHTING FROST in the Garden

By PAUL WORK

IT'S A MAJOR triumph in the garden when radishes are ready in April, beets in May, peas by mid-June and tomatoes in July—all of this subject to adjustment according to the climate where you live. A common measure for all climates is to beat the neighbors or to hit the market when prices

Paul Work

are high. Moreover, it is a major tragedy when frost catches the sweet corn or beans or tomatoes when they have just nicely started under coaxing warmth and pushing soil moisture.

People always say we can't do much about the weather. Actually, we can. We will not be changing the climate very much but we can make changes in our plans, our dates of planting and also we can adopt various devices which will change a tiny little section of the climate immediately surrounding our plants.

First Find the Facts

The first step in adjusting ourselves and our procedure to frost is to know just what are the facts about plants and how frost strikes. People do watch the weather and they say a great deal about frost. Much that is said is true but casual observation and some unfounded traditions tend to warp our judgment. Some of these old traditions are very good. For example, St. Patrick's Day and Memorial Day are not too bad as guides because they come at the same time each year. Easter, a movable feast, is not so good. "Beware of frost at full moon" is open to question but if we change this to say that frost danger is increased on clear cloudless nights, we are noting a useful fact although it does not tell the whole story. The face of the sky needs to be read in conjunction with the behavior of the barometer and thermometer. If, at noon on a day in May, the sky is clear; the wind is in the Northwest; the barometer is rising and the thermometer is falling—one had better begin to prepare for a frosty night.

Another common saying is "Plant corn when oak leaves are as large as squirrel's ears". To one who makes a hobby of fighting superstitions that statement sounds rather weird. Nevertheless, it has a very good foundation for the stage of development of the leaves is a pretty good expression of how far along the season is at a given time. Of course, it does not prove very much about whether there will be frost next week or not; for oak leaves and others sometimes get nipped.

When to Plant

Every gardener ought to know "the average date of last killing frost" as determined by the Weather Bureau. At Ithaca, it is May 4th. This means that after this date, the chances are even that there will be a killing frost at sometime or other. There is also an even chance that there will not. To know this date enables one to make a planting program fairly intelligently whether the average date is April 15th or May 15th. Hardy things such as beets, carrots, onions, peas, radishes and spinach may be planted as soon as the ground can be made ready. One may even include lettuce in this list although lettuce, potatoes and cauliflower are somewhat less hardy. Well hardened cabbage plants can be set

out at the same time.

Among the tender things, there are considerable differences in hardiness. For instance, many plant sweet corn at about the average date of last killing frost taking a little chance. There is about a week which will be required to get the little plants above ground and so in danger of injury. Beans may be handled in about the same way. Tomato plants, which should not be overhardened and which are tender in any case, ought not to be set in most places until three weeks after the average date. Cucumbers, muskmelons, pumpkins and squash may be sowed in the open ground about two weeks after the average date.

Of course, in all these cases, experience is an even better guide and one may be governed by how much of a chance he is willing to take. It must be remembered that some of the tender things like tomatoes, eggplant and peppers will not grow very well in cold, wet weather even though there is no frost to actually kill them.

Black Frost—White Frost

Black frost; white frost; frost at 36°—all these have meanings but after all, the plants are hurt by temperatures low enough to freeze their juices, which means temperatures slightly below 32° Fahrenheit. When people say "there was white frost this morning, the temperature was down to 36°", it means one of two things. Either the thermometer was inaccurate or it was several feet removed from where the frost occurred. My thermometer, set free of the side of the house, is still four or five degrees above the temperature on the lawn on a snappy night. Black frost refers to freezing injury when the air has been so dry that there is no condensation of dew as the temperature falls and so, there is no opportunity for white frost to form. There may be white frost without injury to tender plants if the temperature of the tissue does not drop low enough to freeze the sap. When plants and soil are very wet, there may be no injury from frost because the temperature has not been low for a long enough time to freeze the free water that is present. Thus, sprinkler irrigation is sometimes used for frost protection. As long as there is free water unfrozen on the outside of the plants, the tissues are not hurt. I have seen celery plants that were plastered with ice but uninjured for this reason. If the irrigation is turned off during the night and all the free water present is frozen, then any other heat loss must come from the tissues of the plants themselves and injury will result.

Geography of Frost

The importance of knowing the average date of last killing frost for one's neighborhood is emphasized by (Continued on Page 19)

TODAY there's a new improved feed in the old familiar Checkerboard Bag. Purina Startena, known for many years as the nation's finest starting feed, now contains Puri-Flave, a new exclusive growth ingredient.

Puri-Flave is a concentrate of vitamin G (flavin), a factor which is absolutely essential to the growth of baby chicks. Puri-Flave is added to Startena to make sure that every bag of Startena contains an abundant supply of this important growth material.

When you feed the new Startena containing Puri-Flave you take the guess-work out of feeding chicks. You give your chicks a tried and proven feed. The fact that more chicks are raised on Startena each year than on any other starting feed on the market, is your assurance that Startena does the job.

See your Purina dealer today... have Startena on hand when your chicks arrive!

WHAT DO I REALLY WANT?
I WANT HEALTH!

I DON'T like exercising, but I WANT HEALTH.

One morning in the washroom of a sleeper going East, I was taking my "liver-squeezer" and other exercises when a fat man, weighing over 200, with a tummy like a German goiter, came in. I stopped because there was hardly room for him and my exercises, too. He moved over to the corner and said, "Don't Stop. Go right ahead. I want to see you do 'em." So I finished my exercises and he commented, "Don't that beat you? Well, if I would take 'em, I wouldn't be carrying this around,"—then with a sigh, "BUT I WON'T!"

Like many others, he wanted results without paying the price.

■ ■ ■

REALIZING that good health is our greatest security for the future, I would suggest that you check to see if you are doing the things that build health, or if you are doing the things that tear down health.

If you are robbing yourself of sleep, being intemperate, over-eating, and under-exercising, then you show by your actions that you do not *want* health, and that you choose insecurity rather than security.

If, on the other hand, you find out the habits and diets that build health and stick rigidly to that program, then by your actions you show that you *want* health enough to give up some things that tear it down.

■ ■ ■

WHAT DO YOU REALLY WANT? Good health and the security that comes with it? Then I urge you to take a pencil and paper and write down your wants. Our wants are different. So our programs will be different. I'm going to presume to suggest a proven and tried program which, if followed, will bring results.

Which Do You Want?

SECURITY

(These build up Health)

Regular exercise—a mile a day
Good posture—erect
Sleep—8 hours
Balanced diet—plenty of vitamins in cereals and green vegetables
Eight glasses of water a day

STAND TALL

or

INSECURITY

(These tear down Health)

No exercise
Hollow chest—slump
Burning candle at both ends
Careless eating
Intemperance

In my next column I hope to pass along some more WANTS. If some of my readers would like my program for developing WANTS, send 3c in stamps and I'll send my 12-page WANT pamphlet which will DARE you to attain GREATER GROWTH.

Pumping the HEAT Out of Apples

By ED. W. MITCHELL
Hudson Valley Fruit Grower.

AS KIPLING says, "You never can tell till you try, and then you are apt to be wrong." In this apple business every year is different, but our margin of profit is too small to allow for many mistakes, and the fellow who gets out on a limb is apt to get "shook down to the dogs." That's a term familiar to all the coon hunters who may read this. As the pack of buyers gathers round in the fall when markets are glutted, prices low, and money is needed to pay harvest help, many a farmer feels like a treed coon—he has no place to go but up a tree with the sure knowledge he is in for a "shake down."

This situation happens so often that it is one of the factors on which we must figure, just as we do bad weather, insects and crop diseases. Some provision for it is just as important as having spraying or dusting equipment to protect crops earlier in the season. The practical protection in most cases, is some sort of a storage.

Hands Are Tied

In the past, commercial cold storage was limited mostly to the city and town. This was supplemented by common or aircooled storage at the farm for that part of the crop that could not bear the tax of commercial storage, but which was too good to throw on the market at harvest time. Some of these common storages had ventilating fans, running water or other devices to make them more efficient than the average, but all of them were limited by the outside temperature. An air cooled storage has to sit with its hands tied till the weather turns cold.

Fortunately the spread of rural electrification and the growth of air conditioning have brought good, low priced refrigerating equipment at just the time we need it most. I have yet to meet a grower who has built his own cold storage who regrets the step. All of them wish they had done it sooner.

Like many other farmers, I had a good barn in which I took considerable pride. It has housed horses, cattle, chickens and all sorts of crops. As the fruit came on and other things were dropped from our production, our use for the barn decreased, till finally we made a common apple storage in one end, and used the rest for a packing room and to store empty apple boxes. This was not enough use to pay the carrying charges on the building, and the common storage would not cool off in time for anything but Ben Davis. A more profitable use had to be found for the building, and a better system for keeping the apples. A cold storage was the answer.

Last year we made over an old ice house into a cold storage that would hold 1500 bushels of apples, and got such good results with a little 1½ horsepower, air cooled machine that we decided to make a larger cold storage in the barn.

Insulation is Essential

Our normal crop is about 20,000 bushels, and we want to be able to protect at least half of it by cold storage when we have to. The barn is in five 12 foot bents; two had been shut off for common storage, two are packing room, and a driveway runs through the center. There is a large cistern just outside the door. It is an ideal layout for the purpose.

The building cost was not bad. We

figured that part of the old barn at \$600, and by using farm labor and some second-hand lumber, kept the building cost down to \$1255, or 14 cents a bushel. That is based on using 2 cubic feet of space per bushel and the whole 17,820 cubic feet of space as available for storage. Theoretically it should hold 8910 bushels, but the practical loading capacity is about 7,500.

Keeping Costs Down

Getting the most practical machinery for cooling was more of a problem than re-hashing the old barn. We had to keep the initial investment low, and wanted an outfit that would be economical and easy to operate. According to theory and the refrigerating engineers, one should have about a 5 horsepower outfit to refrigerate 5000 bushels of apples properly, but that brought the initial cost for machinery, and the operating cost higher than we felt was justified. We figured that only half of the space would be needed before the 20th of October, and that the

American Agriculturist, March 4, 1939

room, and the compressor. A 1/6 horsepower motor, set between the twin coils, has a fan on each end of the shaft and blows air across the coils and to the farthest corners of the room. It has capacity to change all of the air in the room every three minutes. The compressor is cooled by a little rotary pump that sends 10 gallons of water per minute through the coils and on up to the roof. There the water cools and flows back to the cistern.

Splitting Pennies

The 3 horsepower compressor is rated to take care of one of the twin coils, or four or five thousand bushel of apples. I wanted to hedge a bit against overloading it during the rush season, and to get as much good as possible from whatever cold flare might be available outdoors. Therefore we had the Jamesway engineer put in a little 19 inch ventilating fan that will change the air in the whole storage every ten minutes. It has a 1/8 horsepower motor and costs only a half a cent an hour for operation. That is some saving over the 3 horsepower compressor motor that costs about 5 cents an hour for current when it is working. There is really no need of splitting pennies that fine, because the electricity up to the middle of January amounted to only 1 1/2 cents a bushel, but I like to split pennies, and I want to get all the fun I can out of the business.

Everything is automatic. A thermostat and air switch in each room starts

This shows about all the machinery used: A motor and a little rotary pump for cooling; the 3 HP motor and compressor; 4 valves, copper tubes and wires to the fans and coils just inside. It's all automatic and frost proof.

later varieties could stand the lack of cold for a few days if necessary. We therefore determined to put in machinery that would cool half the space, and take good care of about 4000 bushel, and use a ventilating fan and outside air to supplement the compressor the last part of the loading season, and whenever weather permitted.

Cold storage of apples is easier than for some other crops because hot weather has dried out insulation to its maximum efficiency; weather is getting colder as the load increases; and loading is normally rather slow and gradual as harvest progresses. On most farms several varieties spread the picking season into fairly cool weather, and much of the heat can be drawn out by letting the day's picking stand in the packing room over night before going into the storage. Careful planning and management may partly replace large, expensive equipment. Our experience with the little storage gave us courage to proceed on that basis.

We put in a 3 horsepower General Electric standard air conditioning unit consisting of one double coil and twin fan in the center of the ceiling of each

and stops the compressor when the temperature varies a degree from the point at which it is set. The water pump is wired to start and stop with the compressor. The fan motor between the coils runs all the time, but as it costs only 7 cents a day for current, and adds but little heat to the room, I think it worth that to maintain a constant circulation of air. As soon as the rooms are cooled down to 32°, and the weather outside is cold, the ventilating fan can take over the job, and the compressor, and the fan motors can be shut off. The change of temperature in the rooms is very gradual and slight after they are once cool, and we find that running the Jamesway for 5 minutes morning and night is ample to keep the rooms down to proper temperature.

Most refrigerating machinery is figured on the maximum load it will have to carry during the peak of the loading period. It takes only a third or a fourth of that amount of refrigeration to maintain temperature, once the rooms are cold. That is why I think it a good plan to have the space divided into smaller rooms arranged so that

(Continued on Page 10)

From the tiny platform of Tell's Chapel on the lake of Lucerne, Switzerland, our party will behold a panorama of overwhelming grandeur.

To EUROPE

Next Summer

WITH spring just around the corner, it's hard to keep one's nose to the grindstone. Thoughts of warm days and plans for vacation keep popping up. And it's not a bit too early to begin to plan now for a trip this summer, especially when a marvelous "all expense" one has been planned for you by your own reliable farm paper.

All of us of *American Agriculturist* are excited about this European trip that we have organized in cooperation with the Canadian Pacific Company and the Travel Service Bureau, of Newton, Mass. Just four weeks will pass from the time we board our boat at Montreal on July 28 until we get back there again on August 24, but during those weeks we will visit the most romantic and beautiful places in seven European countries, as well as experience the fun of life on shipboard.

You can take this fascinating journey entirely free from worry or responsibility, for there will be two experienced escorts along to handle all arrangements for us. You won't even have to wonder whether your money will hold out until you get home. Your "all expense" ticket, which costs exactly \$497.50, covers all transportation from Montreal and return, all meals, hotel accommodations, sightseeing, tips, motor coach trips in England and on the continent, service of escorts, visas, and port taxes. In fact, the only things you have to provide are your passport and money for such personal items as laundry, souvenirs, etc.

We can promise you good company on this trip. A.A. parties are always congenial. As we go to press, we have a grand party leaving for a three weeks trip to the West Coast.

The printed itinerary for our European trip has just come off the press, and we will send this free of charge to anyone who writes in for it. It describes all the places we will visit in Scotland, England, Holland, Belgium, Germany, Switzerland, and France. Also there is a map showing our route.

If you don't want to take this trip, we advise you not to send for this little booklet, for the description of the places we are to visit will draw you irresistibly with us even against your will—the *Lady of the Lake* country in Scotland, Edinburgh with its ancient castles, the English Lake District where the poet Wordsworth grew up; Shakespeare's home in Stratford-upon-Avon, and, close by at Shottery, Ann Hathaway's cottage with its thatched roof; famous Windsor Castle; London, the biggest city in the world, with its countless interesting sights; and then off to the continent where we'll see Holland's windmills, dikes, and quaint costumes; Brussels, capital of Belgium; Germany, with a voyage down the River Rhine, past ancient castles and medieval fortresses. From there we go to Switzerland, whose scenery is so indescribably beautiful and awe-inspiring that it makes you feel as if you were in fairyland. Last but not least, we'll visit France, spending two days seeing Paris and its environs. But send for our itinerary and let it give you full details. Just fill out the following blank and mail it to Tour Editor, *American Agriculturist*, Box 367, Ithaca, N. Y.:

Dear Mr. Eastman:
I am interested in your European Tour, July 28-August 24. Please send me, without any obligation on my part, full information regarding the trip, with complete itinerary.

SPRING WEATHER is an alarm clock to a fruit tree. Trees are hungry for Nitrogen, *the growth element*. There is a big job ahead. Nitrogen is needed in roots, twigs, bark and buds to make blossoms and fruit.

The soil solution will have Nitrogen ready for the roots to send it up to the twigs when growth starts if you apply Sulphate of Ammonia early, at least two weeks before blossoming.

Domestic SULPHATE OF AMMONIA is rich in Nitrogen—20.5% guaranteed—all soluble, all available. It is always dependable... clean... easy to handle... easy to apply.

Fruit trees, to produce well, must make rapid growth in early spring and slow down during summer and fall in order to permit the accumulation of starches and sugars necessary for size and color of fruit, hardness of twig growth and strong fruit buds for next year's crop.

Your trees will wake up working if you apply *Domestic* SULPHATE OF AMMONIA *very early*, at least two weeks before blossoming. It is both quick-acting and lasting in effect. It offers you the best value for your money.

Use *Domestic* SULPHATE OF AMMONIA this year.

Grass Seed MIXTURES

and Notes
for the
Crop Grower

UNDOUBTEDLY some men sow more grass seed per acre than is necessary. If conditions were ideal, a good stand could be secured by sowing half the usual amount, but, says George Serviss, "It is risky to sow less than 15 lbs. of a mixture of grass seed by prevailing methods, and it is wasteful to use more than 20 lbs. to the acre. A good hay mixture should have at least 50 per cent legume seed by weight."

The following grass seed mixtures are suggested:

Dry, Infertile Soils or Heavy Clays That Bake and Crack —

Mammoth red clover	10 Lbs.	5 Qts.
Timothy	5 "	3 "
Redtop	3 "	6 "

Well-Drained, Sweet, Fertile Soils —

Alfalfa	6 Lbs.	3 Qts.
Medium red clover	4 "	2 "
Alsike	2 "	1 "
Timothy	6 "	4 "

Fair Drainage, Moderately Sweet Soils —

Medium red clover	6 Lbs.	3 Qts.
Alsike	4 "	2 "
Timothy	8 "	6 "

Wet Land (Reduce Timothy and Red Clover and Increase the Alsike on Soil Both Wet and Sour)

Medium red clover	3 Lbs.	1½ Qts.
Alsike	5 "	2½ "
Timothy	5 "	3 "
Redtop	5 "	10 "

* * *

Chippewa Performance

In New York State last summer Chippewa potatoes were compared with Cobblers in 12 counties. In all but two tests the Chippewas gave a larger yield of No. 1 potatoes, the average difference being 39 bushels per acre.

Chippewas mature a few days later than Cobblers and the tubers are very white, well-shaped, and shallow-eyed. Some people question the cooking quality of this variety.

* * *

What the Tag Shows

Reliable seed dealers resent the inroads being made in their business by fly-by-night concerns who sell so-called bargain or cut-rate seeds. The buyer can be reasonably certain that the price is low because the seed lacks quality. Commonly in states that have seed labeling laws, the information about the seed must be on the tag. However, the law does not prohibit the sale of poor seed. It is up to the buyer to study the tag and draw his own conclusions as to the quality.

* * *

Inoculating Legumes

Both in 1937 and 1938 about twice as much legume inoculant was sold as was used in 1934. Many states now have laws requiring that commercial inoculants be tested, and Dr. A. W. Hofer of Geneva reports that present day cultures are consistently reliable.

It is generally known that where a particular field has grown legumes, the soil generally contains proper legume bacteria. However, tests have shown that in most cases the addition

Without nodules similar to the one shown on this soy bean root, legumes cannot utilize the nitrogen from the air. Inoculation with the proper commercial bacteria is good insurance.

of commercial inoculants to the seed will increase the yield.

Inoculation is essential where legumes are grown on fields where that crop or one in the same group has not been grown in recent years.

* * *

Home-Grown Clover Seed

A good many New York farmers harvested some clover seed last year. Much of this has been tested at Geneva and reports indicate that home-grown red clover, grown last year, is remarkably free of weed seeds and that it is a good buy.

* * *

"Z" Disease

In 1933 and 1934 the so-called "Z" disease appeared in some western New York potato fields. It now appears that last year the disease was present on more than 100 farms in 13 western New York counties. Counties of Genesee, Monroe and Wyoming seem to have been affected the worst.

The disease is difficult to describe, but it often appears that a blow-torch has been applied to occasional healthy plants, burning some more severely than others.

No complete control measures have as yet been worked out, but Dr. C. S. Tuthill of Cornell says that an 8 per cent formaldehyde dust, used carefully, has helped. The disease is serious only on Rural varieties of potatoes.

Pumping the Heat Out of Apples

(Continued from Page 8)

all of the refrigerating capacity can be concentrated on the room that needs it most, and to have a ventilating fan to supplement the compressor. The twin coils in the center of the ceiling of each room are controlled by valves, so we can use either pair and concentrate on the one room; or run one coil in each room, or two in one room and one in the other, or all four at one time. It works out as handy as a pocket in a shirt.

Putting in the Apples

We loaded the lower floor with Macs, Cortland and Greening while the upper floor was being finished; in fact, we had a thousand bushel stored before the machinery was installed. Then we piled in from 400 to 600 boxes of hot apples a day against an estimated loading capacity of 300. That gave the equipment a thorough test, and although we could get down to only 36 to 40 degrees during that period, the apples kept well, and we are well pleased with the results. There were only three nights during that period when it was cold enough to use the fan, but when it did run it brought the temperature down about a degree an hour.

It is a feature that should be included in every installation of this sort.

We built an elevator out of two old hay loaders to take the apples up to the second floor. Besides learning how to build an elevator, we learned not to wait till the afternoon of the last day to build a storage. As usual, construction was delayed, waiting for a few minor parts, and we had the fun of holding some 4000 boxes of apples on the barn floor for a week, with a cold storage only 10 feet away, but in the wrong direction—straight up. It was very tantalizing, and did not help the keeping quality of the apples one bit more than it did my naturally sweet disposition. It was just another one of those little things that keep farm life from being dull.

Finally we got the elevator to functioning perfectly. Then we shot in those ripe, hot apples at the rate of about 1000 boxes a day. That was much too much for the equipment to cool, and came at a time when there was no cold night air to help with the job. Even with that handicap, we were able to hold an average of from 36° to 38° during that loading period, and could get down to 32° as soon as the loading let up for a day or two. The apples that were in good condition when they were stored, kept well; but the drops and apples that were over-ripe had to be moved by the first of the year. I am pretty well convinced that under normal conditions apples will keep fairly well at a temperature of from 34 to 36, or even 40.

What It Cost

The cost is not prohibitive. The machinery cost a little under \$2,000 so that building and machinery stand us between 25 to 35 cents per bushel, depending on whether one figures maximum, or convenient loading capacity. Electricity for operation cost \$80.34 (5356 kilowatt hours at 1½¢) to cool something over 6000 bushels from September 27th to January 19th. That figures about 1½ cents per bushel for current.

Selling apples well is just one degree harder and more important than growing them well. If we can't sell them at a profit—why bother to grow them?

Agricultural Conservation

There have been few changes in the provisions of the 1939 Agricultural Conservation Program for northeastern states. Farmers who wish to cooperate in this Program may earn payments in two ways—by using approved soil building practices, and, in some cases, by staying within acreage allotments for potatoes, wheat, tobacco, and vegetables.

Local meetings are being held to explain provisions of the Program to interested farmers, or information can be secured from your County Farm Bureau Agent.

The federal appropriation to handle the Program has not as yet been made, but that is nothing new. In previous years the appropriation has been made after the program has been started.

"MAW ACTS YOUNG FOR HER AGE, WHATEVER IT IS"

The McCormick-Deering No. 61... A NEW 6-FOOT COMBINE AT A NEW LOW PRICE

\$695

f.o.b. factory, complete for power-drive operation, with choice of grain tank or bagging platform. Machine complete with auxiliary engine as shown, \$855 f.o.b. factory.

ONLY THE McCORMICK-DEERING No. 61 GIVES YOU ALL OF THESE FEATURES IN A 6-FOOT COMBINE

• At its low price of \$695 f.o.b. factory, the new 6-foot McCormick-Deering No. 61 is the *greatest combine value you can buy*.

Check over the grain-saving features listed here. Then consider these *extra-value* facts: The No. 61 cuts and threshes 15 to 25 acres a day at a saving of 12 to 15 cents a bushel in wheat, compared to the binder and thresher method. It makes the harvest a *family affair*. It eliminates the use of twine, and shocking and stacking.

Cut harvesting and threshing costs to the bone and save grain—you can do it with the McCormick-Deering No. 61. Ask the International Harvester dealer about it. You can buy it on the Income Purchase Plan. Other sizes also, up to 16-foot cut.

I'D LIKE TO FOLLOW
THE MILK TO THE CITY
SOME DAY

YOU'D FIND A FEW
SURPRISES IN THOSE
CITY PLANTS!

IT NEVER FAILS to open a dairy-farmer's eyes, when he sees what happens in the city to the milk he produces. The necessarily costly equipment that guards it. The precision apparatus that pasteurizes and bottles it. The scores of trained men and women who test and guard it with laboratory protection.

The job of Sheffield Farms is

a complicated and delicate job. The milk that farmers produce must be rushed to the city at express schedules and delivered on time to hundreds of thousands of homes. And, in addition, Sheffield helps farmers to produce better milk . . . works to balance supply and demand . . . does many things, generally benefiting the dairy industry.

SHEFFIELD FARMS

A LEADER IN THE DAIRY INDUSTRY FOR 98 YEARS

524 WEST 57th STREET • NEW YORK CITY

"YES"—"NO", Say Judges on Milk Marketing Orders

(Continued from Page 5)

the Buffalo area started when Commissioner Noyes of the New York State Department of Agriculture and Markets started legal action to require four Buffalo dealers to pay into the equalization fund sums due as provided in the State Milk Marketing Order. The four companies were the Erie and Wyoming Farmers Cooperative Corp., Trevett Cooperative Association, Inc., Sterling Amherst Farms Dairy, Inc., and Arthur E. Landel doing business as the Williamsville Dairy.

Judge Bergan's decision of unconstitutionality was based on the premise that the Rogers-Allen Law unconstitutionally designates legislative power to the Commissioner of Agriculture and to producers. The Judge did not question the right of the State Legislature to regulate the dairy industry in the public interests or to fix prices, but indicated, also, that the Law neglects to state a public policy declaring that fixing a minimum price to milk producers is a solution to the troubles of the dairy industry.

Commissioner Noyes has said that if the points brought out by Judge Bergan can be corrected by minor legislative changes in the Rogers-Allen Law, this should be done as quickly as possible. He states there will be an appeal of the decision, and says that it will be difficult to regulate the milk industry of New York City until the appeal has been decided. Attorneys for the distributors have agreed that they will not stand in the way of an early appeal.

Now let's take a look at Judge Sweeney's decision on the Boston case in which he upheld the validity of the Boston Milk Order. Defendant milk dealers claimed that the Marketing Agreement Act and the Boston Order were invalid because they provided equalization on a market pool basis. Judge Sweeney disagreed, giving as authority for that decision, the recent decision of an Indiana Court in the Crescent Creamery case.

Dealers also claimed that the Act was invalid because it designated legislative authority to the Secretary of Agriculture. The Court denied the charge, holding that the Act set up definite standards for the Secretary to follow in issuing an order and also placed definite limitations on the provisions that could be made a part of any order. Judge Sweeney sustained the provisions concerning the producer referendum, citing a recent decision of the U. S. Supreme Court in the Currin case.

The third claim of the dealers was that the milk produced in Massachusetts and distributed in Massachusetts was beyond the control of the Secretary. The Court held that Congress has a right to regulate this local milk in order properly to regulate inter-state traffic in milk.

Let's look for a moment at the events leading up to Judge Cooper's adverse decision on the Federal-State Milk Marketing Agreement for New York. Some time ago government agents started action against four distributors—the Jetter Dairy Co. of Oriskany Falls, the Central New York Cooperative of Cortland, the Schuyler Junction Cooperative of Frankfort, and the Rock Royal Cooperative of Delhi—contending that these concerns had refused to comply with the Milk Marketing Order by failing to participate in the producers' settlement fund as required by the order. Judge Cooper, in his decision of un-

constitutionality, indicated that the laudable purposes of the statute to secure better prices for dairymen are not criticised or condemned, nor is there any denial that the production and sale of milk present peculiar problems due to an excessive supply at certain times and scarcity at others. He stated that the challenge concerns the means set up in the statute and order for dealing with the conditions.

The defendant dealers claimed that the order permitted such gross discrimination as to drive them out of business and to confiscate their property without any lack of efficiency on their part. The defendants also claimed that the order was put forward by the Metropolitan Cooperative Milk Producers' Bargaining Agency in connection with the Dairymen's League; that it had the effect of driving out of business competitors not enjoying favorable arrangements with the cooperatives; that the vote on the referendum was brought about by misrepresentations as to the terms and effects of the order and bill on the part of agents of the Secretary of Agriculture and the State Commissioner of Agriculture as well as by the Bargaining Agency and the Dairymen's League; that the referendum was unfair; and that the Dairymen's League alone caused two-thirds of the favorable vote.

We will guarantee that a vote taken on the Order tomorrow would show an even bigger majority of dairymen in favor of it.

Judge Cooper's decision says: "The conclusion is that the statute as applied in the order is unconstitutional as to all of the defendants with the application of the situation and conditions here existing; that the order was not approved in accordance with the provisions of the statute and should not be enforced."

The question, "Where do we go from here?" is being considered by all who are earnestly and honestly concerned with the welfare of dairymen. There are several possibilities.

The first one that suggests itself is an appeal from the New York decisions. Doubtless that will be done. It is entirely in order to take controversial matters of this sort to higher courts, and history records innumerable cases in which these higher courts have reversed decisions. Unfortunately, that will take time. Cows have a habit of expecting a milker twice a day. Consumers want their milk delivered on the doorstep each morning, and while many dealers are fair and square, others will grasp every opportunity to beat down the price of milk.

The second alternative affects only the Rogers-Allen Law. If, as it seems from the decision, a few slight amendments or changes in wording are what is needed, that should be done without delay.

The third possibility is for organized dairymen to shoulder the load and carry on. In many ways this is the ideal solution. But it is far from simple. If a minority of dairymen are satisfied with the few cents more per hundred than their neighbor gets, regardless of the fact that both may be getting starvation prices, dairy cooperatives will be greatly hampered and perhaps prevented from handling the situation.

Perhaps we should mention a fourth possibility—just to let things drift. That would be the easiest course to follow, but unfortunately drifting is always downstream and never up.

Grange Gleanings

CHARLES M. GARDNER

Editor of the National Grange Monthly and High Priest of De-meter of the National Grange.

NEW YORK Grange workers are looking forward to a series of regional conferences covering the entire state, with at least one such meeting brought within easy reach of every local community. These conferences start March 21 at Weedsport in Cayuga County; continue daily until April 1; then a break until April 22 and continuous county meetings to April 28; resume again May 9 and continue until May 24, when the final conference will be held at Bloomingburg. The State Lecturer, Mrs. Stella F. Miller, will be present at all conferences, State Master Raymond Cooper and associates will attend many of them; and the interests of the Juvenile Grange will be given a prominent place on the program. At most of these events the Dean Vivian slides will be shown, presenting in significant pictures the ritualism of the Order of Patrons of Husbandry.

ANOTHER GRANGE HALL dedication event in New Jersey has just attracted wide interest, when Grandview Grange at Flemington formally entered into the use of a beautiful new home, fully 300 Patrons and friends being present for the occasion, with State Master David H. Agans the dedicating officer. Grandview Grange is almost 40 years old and has a present enrollment of 450 alert Patrons.

THE MEMBERS of Meriden Grange in Connecticut, largest subordinate in the state, are very proud of their "grand old man," Herman Hubbard, who has just celebrated his 95th birthday. Mr. Hubbard is an enthusiastic member of the Order and attends Meriden Grange meetings quite frequently.

SORROW pervades Massachusetts Grange circles in the death of one of the most faithful members of its deputy force, James E. Hamilton of Palmer, a successful dairyman of Hamden County and a leader in all community affairs. He had served as both subordinate and Pomona deputy for a long period of years, and as such had officially inspected many of the Granges of the Bay State.

THE GRANGE LECTURERS of Maine to the number of more than 200 recently held their annual conference, heard earnest speakers, and made extensive plans for the year's work

ahead. One feature of the lecturers' get-together was the invitation of Governor Barrows (extended to the entire conference group) to a luncheon in the executive mansion, which is the old James G. Blaine homestead in Augusta. Governor and Mrs. Barrows graciously welcomed their Grange guests and in a receiving line with State Grange officers personally greeted all the visiting lecturers.

STATE LECTURER Charles R. Eastman is preparing a very attractive program for the annual school for Granite State lecturers, and will cover in a two days' session all phases of the Grange program. Prominent leaders in the life of New Hampshire are included in the speakers' list and National Lecturer James C. Farmer will sound the keynote of the session. The dates are March 29 and 30, and the meeting will be held at the University of New Hampshire.

STATE MASTER Edgar L. Tucker of Connecticut is calling on all the Granges of that state to stage a local tree planting occasion, either on Saturday, April 8, or as near that date as possible. Such planting will take place around Grange halls, schoolhouses and other public buildings, and will be accompanied by appropriate exercises.

IN NEW HAMPSHIRE a series of workers' conferences and exemplification meetings is being held, in charge of State Master William J. Neal, covering all sections of the state. One of the largest of these will be for southeastern New Hampshire on Friday evening, March 31, at Rochester.

Fruit for the Home Orchard

(Continued from Page 1)

after which comes Schmidt. Tartarian is soft-fleshed, but Schmidt is firm and of delicious flavor. Still later is Windsor, which hangs well and prolongs the cherry season well into July. Of the light-fleshed varieties, Napoleon is among the best. Every farm should have a Montmorency sour cherry for canning, while English Morello will provide later fruit in this class.

Space should be found for an Orange quince, whose products enrich the table in the winter.

Good grapes may now be had around the first of September. Green varieties ripening at this time are Portland and Ontario, while Fredonia is the best early blue grape. Where frosts come early, these are all that will ripen reliably. Delaware, with its compact clusters of small red berries, is to grapes what Seckel is to pears. Too well known to need description are Niagara and Concord. Where seasons are long enough, Sheridan should be grown for its keeping quality, and Golden Muscat for its delicious flavor and large clusters. An interesting novelty is the Concord Seedless, which is fine for pie and jam as the berries are seedless.

Newburgh is a good red raspberry that is little troubled with mosaic. Later and of better quality is Taylor. Good blackcaps are Shuttleworth, Bristol, and Naples, which ripen in that order. For jam and canning the Sodus purple raspberry is excellent. Eldorado blackberry, Red Lake currant and Poorman gooseberry complete the list of bush fruits. Fairfax is the highest quality good strawberry, while Catskill is the biggest and most productive, and good in quality.

Many other good varieties are available, but those listed are all reliable, and, if well-cared for, should yield an abundance of fruit throughout their season. The collector of varieties who may want special purpose varieties, or wants to try new sorts as they appear, may apply to the writer for further information as to varieties and sources of stock.

THE ONLY MILKER WITH THIS Important PRINCIPLE

It milks every cow, every day in the year, in exactly the same uniform rhythmic way, with a fast, pleasing, alternating action. It's the **DE LAVAL MAGNETIC**

FREE TRIAL

There are 5 types of De Laval Milkers, for every need and purse. Your De Laval Dealer will gladly provide you with a Free Trial Demonstration.

THE cow is a creature of habit—she doesn't like change; which is especially true of milking.

The De Laval Magnetic Milker applies this important principle. It milks cows in the best possible way, without variation, every day in the year. Cows are not disturbed by any variation in speed or manner of milking.

Milking action is magnetically controlled from the pulso-pump. Every unit works in exactly the same uniform, rhythmic way, with a fast, alternating action pleasing and stimulating to the cows. It is the only milker with this important feature. Proof of superiority is the many outstanding yearly herd records made by De Laval milked cows.

THE DE LAVAL SEPARATOR CO.
New York 165 Broadway Chicago 427 Randolph St. San Francisco 61 Beale St.

INTERESTING CONTESTS \$3,000.00 IN CASH PRIZES

YOU DO NOT NEED TO BE A DE LAVAL USER TO ENTER CONTESTS

Any member of a farm family having one or more cows is invited to enter. See nearest De Laval Dealer for instructions and entry blanks for Contests. You are not required to buy anything and you may win a substantial cash prize. If you do not know your nearest De Laval Dealer where entry blanks may be obtained, write nearest De Laval office for his name. Contests end on April 30, 1939.

A GIFT FOR EVERYONE:

Every qualified entrant will be sent a free copy of the famous pocket-size De Laval Diary and Farmer's Handbook of Useful Information as soon as entry to the Contests is received at De Laval office.

DE LAVAL—World's Best Separators

For 61 years the name De Laval has stood for the best in cream separators. They skim cleaner, run easier, last longer, produce cream of better quality, and are easier to clean and wash than any others.

There are three complete series of De Laval Separators, providing sizes, styles, prices and terms for every need and purse. They can be bought on such easy terms that they pay for themselves while being used. De Laval Dealers will gladly supply free trial demonstration.

FIGHTS INFECTIOUS GERMS while it speeds up Healing

FREE Sample

A generous 1-oz. facsimile package is yours at bare cost of packing and postage. Send 4¢ in stamps and demonstrate for yourself how Bag Balm promotes rapid, clean healing of injured tissues.

This famous aid to health of udder and teats is now vastly improved. Scientific research has developed an active ingredient which has the power to kill germs—a capacity seldom found even in human ointments. More than ever before you now have a truly SAFE ointment to guard the tender tissues that deliver the pay crop of dairying. Cuts, chaps and open wounds are natural incubators of infection. Bag Balm now kills these germs, at the same time promoting rapid healing, assuring naturally soft tissues. Bag Balm cannot taint the milk, and is correctly stiff for effective massaging of Caked Bag and to prevent rubbing or rinsing off too soon. Splendid for ALL FARM HEALING.

The Bag Balm package, and even the name, are widely imitated. Be sure you get the genuine. No substitute can deliver the well-known Bag Balm results. Big 10-ounce package only 60¢—at feed dealers, general stores and druggists. Send for free veterinary book, "First Aid for Dairy Cows."

DAIRY ASSOCIATION COMPANY, INC.
DEPT. 12-A, LYNDONVILLE, VERMONT

FOR SAFETY'S SAKE USE BAG BALM DILATORS

For internal teat injuries, scabs, hard milkers, etc. Designed to hold milk duct in natural shape while healing; molded of non-breakable ivory-like plastic, cannot absorb or carry pus infection. Fluted shaft carries in healing, antiseptic Bag Balm. Will not overstretch or slip out. 25 in ointment, 60¢ at dealers or postpaid.

HORSES

HEAVY AND HANDY-WEIGHT. FARM WORK HORSES: high-grade Belgians and Percherons at lowest country prices. **FRED CHANDLER**, Chariton, Iowa.

By J. F. (DOC) ROBERTS

HERE are some things heard, said, and overheard during Farm and Home Week at the New York State College of Agriculture:

Prices of farm commodities will probably not be much higher this coming year. There is reason to believe farm prices have about hit bottom. WE would then say there is only one place to go—up—but THEY say probably not, barring a war or some such catastrophe.

Somebody said that last year in some counties horse replacements cost the farmer as much as cow replacements. Horses are still "big business" in New York State.

The corn yield in at least one central New York county was as great last year as the average acre yield in the great corn state of Iowa.

"Where can I buy some really good Guernsey cows?" Answer "I do not know, the demand is too great."

"Who wants to sell some good young Delaine-Dorset cross-bred ewes?" Answer. "Nobody—that has any."

Most farm people, when talking just between meals and lectures, do not believe the surplus milk problem is solved.

Marketing and production—the fact that they cannot be separated is really beginning to take hold.

Extension work and research work—these are also being coupled, the feeling being that until what is already known is practically made available—why get more?

The quick freezing of farm meats and vegetables at a centralized plant and then kept almost indefinitely in new, home zero-temperature refrigerators, not only opens up new living conditions everywhere, but new distributing systems, new production methods, in fact, its possibilities are so broad and far-reaching and yet so probable, that it is fun to think about it.

Livestock success depends upon the efficiency used in handling surplus feed on any farm or in any community. In this connection, I particularly like the use of the word "surplus" because it conveys the idea of a two-way operation.

Again this year the outstanding encouragement received from my few days here was the increased interest, not only at all livestock meetings, as shown by the attendance, but also the interest in the discussions of pasture improvement and the various uses and preparation of all sorts of hays.

The Town Meeting

(Continued from Page 2)

long. Such a situation has a peculiar effect on their ego.

The receipt by the smaller units of government of so-called state aid is something that is fraught with danger to the preservation of local control. There is an entanglement or in ordinary language a "tail" to such transactions—the "tail" is loss of some of the local control. Such processes are insidious—they work slowly yet surely. It is the working of the law of compensation which is a universal law. If you do not pay for something—you do not get the real article. You get a semblance of it. Most smart people prefer to step up and pay.

"Home rule" was not lightly gained

Are Dairymen Being Cheated?

AS A RESULT of the article under this title, published in the last issue of American Agriculturist, we are receiving many letters from dairymen discussing the butterfat test.

Many believe that they are getting an honest test; a majority do not. Before publishing anything more on the subject, we would like to hear from more dairymen. If you have not done so already, please fill in the following questionnaire and return it to American Agriculturist, Department B, Savings Bank Building, Ithaca, N. Y. If you have additional facts and views, write a letter also. Your name, of course, will be kept confidential:

MY EXPERIENCE WITH THE BUTTERFAT TEST

1. In your opinion were there too wide variations in the butterfat test for your herd at the milk plant during 1938?
2. Did you make a complaint to the plant manager during 1938 about your herd test?
3. Was an adjustment made following your complaint?
4. What was the adjustment?
5. Do you belong to a Dairy Herd Improvement Association?
6. Do you think that membership in the association has affected the test at the milk plant?
7. Are you entirely satisfied with the present method of sampling and testing your milk?
8. Do you have any suggestions for changing the present system?

Name

Address

and should not be lightly lost. It is a long time since Col. Richard Nicolls, the first Governor of the English colony of New York called a general meeting of deputies at Hempstead on March first 1665. The taxpayers of the towns elected the representatives. The Duke's Laws were worked out at this convention in which home rule by the people was recognized in principle and later worked out in a manner quite similar to our present system.

In the preamble of the first state constitution in 1777 we find: "This convention therefore, in the name and by the authority of the good people of this state, doth ordain, determine, and declare, that no authority shall, on any pretense whatever, be exercised over the people or members of this state, but such as shall be derived from and granted by them."

I think we need to watch that thought—"ON ANY PRETENSE WHATEVER", and take the hint from the Dukes Laws of 1665 that:

"In perticular Townes many things do arise which concerne onely themselves."

Publicity Increases Use of MILK

FOR SEVERAL years New York State has been trying to increase milk consumption through advertising and other publicity. Appropriations are made each year by the Legislature for this purpose, and later this money is collected and returned to the State by the milk industry. The tax is $\frac{3}{4}$ of a cent per hundred. Of this the dealer pays half and the producer half.

The Bureau of Milk Publicity is set up in the Department of Agriculture and Markets, and the problem of increasing the interest and knowledge of the consumer in milk and its products is approached from many angles. For example, in addition to straight advertising in newspapers, the cooperation is secured of schools, hotels, health, civic, women's, and youth organizations, Chambers of Commerce, granges, farm and home bureaus, in fact an effort is made to cooperate with any and every organization that can help in giving milk publicity. Milk Weeks and Milk Months are featured in some 25-30 cities, hundreds of talks on milk are given before civic groups and women's organizations, demonstrations on the food and health value of milk are given in colleges and high schools, special exhibits are put on at Fairs and Conventions, a large amount of free publicity on milk is secured through the press and the radio, and thousands of posters and milk slogan cards are distributed through banks, hotels, and in any other way by which they can be got before the public.

Milk is a cheap food compared with any other food, but it is hard to get this truth across to consumers, because they are so often told that milk is too high in price. It would seem that all this milk publicity activity, supported by the prestige of the State of New York, ought to help convince consumers that milk is the best and cheapest food in the world.

LETTERS

North Java, N. Y.
Jan. 4, 1939.

Dear Sirs:

Thanks very much for so promptly paying my claim, following my accident recently, which resulted in my being in the hospital for several days and then confined to the house for weeks.

I recommend your Company as a very good investment to any one.

Thanks again for my check for \$41.43.

Sincerely yours,
DONALD KEENAN.

* * *

Huntington, Vermont,
January 9, 1939.

Dear Sirs:

May I express my appreciation for the check for \$14.28 received and for the prompt manner that my case was handled. No other Insurance with so small a premium in my opinion offers more protection. It is my sincere desire that it will not be necessary to draw on this policy again, but will continue to subscribe for same because of the fine protection it affords for so small a cost.

Sincerely,
RUTH E. JAKUES.

* * *

Westfield, Pa.

Dear Sir:

I wish to thank you for your promptness in settling my claim, \$50.00 in the accident I had on October 25, 1938.

I have carried your North American Readers accident policy for the past twelve years and this is by second claim. On each occasion I have received prompt and courteous attention.

You may publish my letter in the *American Agriculturist*, with the statement from me that I recommend your accident insurance to any one who can qualify.

Very sincerely yours,
I. WARREN PLANK,
Westfield, Pa.

* * *

Ashfield, Mass.
January 11, 1938.

Dear Mr. Thomas:

Thank you for the check of \$30.00 which I received in settlement of my claim. I was very much pleased with your prompt action.

Sincerely yours,
ESTHER L. BENJAMIN.

Poughkeepsie, N. Y.

NORTHEASTERN Slants ON THE National NEWS

Wagner Act Changes Proposed

BILLS outlining drastic changes in Wagner Labor Act have been introduced into Congress by Senator Edward R. Burke of Nebraska, and Senator David I. Walsh of Massachusetts. Burke bill would replace present National Labor Relations Board with another whose members would represent employers, employees, and the public. Present Board, said Senator Burke, is composed only of "organized labor partisans." Also proposed by Burke are: (1) Clipping of Board's powers; (2) Setting up of alternative system of handling labor disputes in federal courts; (3) Making it an offense for labor organizations or employees to threaten workers, or to interfere with orderly conduct of an employer's business, or to strike without an affirmative vote of a majority of employees, or in violation of a contract.

Walsh amendments were originally introduced on behalf of American Federation of Labor, but are reported now not to have A. F. of L's full support. Walsh and Burke bills will be studied by Senate Labor Committee at an early date and public meetings held later.

SLANT: Farmers are vitally interested in question of amending Wagner Act. *American Agriculturist* is sponsoring a movement to get gigantic petition from Northeast farmers and business men, demanding that Congress change this Act to provide a square deal for business and agriculture. If you have not signed the petition printed in our January 7th issue, write us today for a blank.

More War Jitters

BEFORE sailing on his Caribbean cruise to view fleet manœuvres recently, President Roosevelt made two radio speeches in which he called upon American Republics to stick together to save democracy from "ugly truculence of autocracy", and he again pledged his Administration to good neighbor policy. Also, he declared that disturbing conditions in Europe might cut short his two-weeks cruise.

"Disturbing conditions" abroad include the following:

1. Italian demands for French territory show no signs of letting up. Meanwhile, France is strengthening her defenses in Tunis and Somaliland, and Italians are reported to be mobilizing. Germany is also said to be calling up men for special training.

2. Hitler, Mussolini, and Franco, Spain's victorious Rebel Commander, are reported to be planning get-together in Milan before long to map out "common front in connection with international problems."

3. Third European sore spot continues to be Spain where, as we go to press, peace still hangs in the balance. Defeated Loyalists offered to end fighting and give up Spanish territory they still hold, on condition that General Franco would be merciful to government leaders and sympathizers. Franco has flatly refused anything but unconditional surrender. French and British efforts to intercede seem to have failed.

We Build Planes

By vote of 367 to 15, House of Representatives approved and sent to

Senate bill to increase our army's air fleet to 5,500 planes. Over 1,000 military planes have been ordered by France and Britain from U. S. manufacturers, and prospect is that orders will be filled in spite of row over President Roosevelt's action in permitting a member of French Air Mission to fly in one of our latest fighting planes, and subsequently his "secret" conference with Senate Military Affairs Committee. General reaction in this country to supplying France and Britain with planes is that it is not only good business but will tend to keep the dictators in their place.

Right and Wrong Farm Aids

SAID Representative Lemke, North Dakota Republican to Senate Agricultural Committee other day:

"After being lost in the dismal swamps for six years Secretary Wallace has come out of the same hole he went in, just where Mr. Hoover left us."

Representative Massingale, Oklahoma Democrat, criticizing present farm law, said:

"If we keep on trying this thing for another year or two we won't have anything to try it on."

In place of present crop control law, both speakers advocated substituting the cost of production measure now before Congress. Said Lemke:

"With a cost of production law farmers could produce all they wished and would receive a guaranteed price for that part of their crop consumed domestically."

Senator Lucas, Illinois Democrat, said a cost of production law could never be properly administered.

SLANT: Cost of production law would be just as impossible as present crop control law is. With guaranteed costs of production farmers would soon produce largest crops in history, completely wrecking markets. Both proposals are wrong. If government really wants to help, let it give farmers and others an honest dollar, and then give agriculture a good letting alone.

Real Wages

SPEAKING at National Farm Institute, Des Moines, Iowa, February 17, Chester G. Davis, member of Federal Reserve Board, and former administrator of AAA, said United States had greatest endowment of natural and mechanical resources in world, and yet there were millions of unemployed and country was faced with stark paradox of an almost unlimited gap of unfulfilled human wants and needs. Warned Davis:

"Unless this dangerous situation is met, United States will go Fascist and lose its liberties."

Some suggestions offered by Mr. Davis to meet this situation are:

1. Lower prices by manufacturers, looking to volume production instead of increased prices for their profits.

2. Larger real wages to labor by fixing their eyes on amount earned at end of year from steady employment in producing things people need rather than on highest attainable hour-wage for a minimum of production.

Paul G. Hoffman, president Stude-

baker Corporation, at same meeting said intensely competitive forces in automobile industry had resulted in low automobile prices with large sales, with low profits per machine but good profits on large volume, together with large employment.

"Price and wage controls didn't work for the Babylonians, and have not worked for benefit of business, labor, or consumer at any time since. We cannot loaf our way or legislate prosperity. We have got to work for it. We will start a real recovery in the United States only if and when business, labor and farmers cease their migration to State capitols and Washington asking for special privilege, but instead go for one purpose and one purpose only, and that is to see that free enterprise is kept free in America."

Farm Credit Helps Farmers

MORE than 6,000 farmers in the United States received mortgage loans with which to purchase farms during 1938. According to F. F. Hill, Governor of the Farm Credit Administration, loans averaged from \$3,000 to \$4,000.

Mortgage loans are made by Federal Land Banks. Three other banks take care of various kinds of credit needed by farmers. These are: the Intermediate Credit Bank, the Production Credit Corporation, with production credit associations throughout the country, and the Bank for Cooperatives which makes loans to farmers' cooperative organizations.

SLANT: Farm Credit System, mostly on a cooperative basis, makes loans available to farmers who can qualify at a reasonable rate of interest. They have been of great help to farmers during the hard times.

Argentina to Buy Less From U. S.

HENCEFORTH, Argentina will spend only as much money for American goods as we spend for Argentine goods, according to official announcement from that country. This will mean 40 per cent cut in Argentina's purchases from United States. Reason given: Argentina's diminishing foreign trade and growing deficits. Although similar policy will be followed with regard to all other countries, United States is hardest hit because it sells so much more to Argentina than it buys from her.

Argentina's action is also being looked upon as protest against United States trade bars which keep out her farm products that compete with our homegrown ones, particularly Argentine beef on which United States laid wholesale embargo because of presence of hoof and mouth disease in some areas. Recent refusal to allow sale of Argentine meat at Argentine Building of New York World's Fair brought things to a head.

Argentina is now expected to trade more with European countries, particularly Britain, Germany and Italy which are willing to barter their manufactured goods for Argentine wheat, meat, flax and corn. Germany, commenting on Argentina's action, called

it blow to President Roosevelt's good neighbor policy.

SLANT: It is almost impossible for this country and Argentina to get together on trade, because both export same farm products and are competitors. Also, American farmers are being paid by government to cut production of some of very products which Argentine produces. Farmers have not forgotten that, in 1937, AAA crop control and drought forced them to import large quantities of Argentine corn.

■ Golden Gate Fair Opens

OFFICIALLY open and operating since Feb. 18 is great West Coast Exposition, located on Treasure Island in San Francisco Bay. It has taken three years to create the Western fairyland, for it had to be built not only from "the ground up" but from "the water up". Before work started, you could have sailed a boat where Fair now stands. Four hundred acres were drawn from bottom of San Francisco Bay and spread out in rectangle a mile long and 3,400 feet wide, at cost of nearly 4 millions. Total cost was about 7 millions and includes permanent buildings, roads, drainage, sewerage, water supply, etc.

American Agriculturist folks will be among first visitors to Fair, for our California Tour party (numbering 101 persons) gets there March 5. Among sights they will see are fascinating industrial exhibits, displays showing how western agriculture grows and markets its large-scale and specialty crops, latest accomplishments in electricity, a "treasure mountain" in which gold and other minerals will be mined daily, collections of famous art treasures from abroad, pageants depicting pioneer days, a Chinese village, the "Gayway" or fun area, and a million dollars worth of beauty in form of California flowers, trees, shrubs, lagoons, outdoor murals and entrancing effects in color lighting at night.

■ Nazis Hold Giant Rally in N. Y. City

GERMAN-AMERICAN Bund supporters marched by thousands into Madison Square Garden in New York City on Feb. 20, carrying banners with violent anti-Jewish slogans. They were ushered to their seats in the huge auditorium by uniformed "storm troopers." Although Bund officials were said to have promised that no anti-Jewish statements would be made at rally, Jews were freely attacked and banners on walls of auditorium screamed: "Smash Jewish Communism", "Stop Jewish Domination of Christian Americans", etc.

Thousands of anti-Nazi demonstrators gathered in nearby streets to protest against the meeting, but were barred from approach to Madison Square Garden by barrier of mounted police. Mayor LaGuardia, absent from city on speaking tour, had refused to prevent the rally, declaring New York City would protect Bund's right of free speech.

Commenting next day on the Bund meeting, New York Times said:

"We need be in no doubt as to what the Bund would do to and in this country if it had the opportunity. Unless its attitudes and utterances are greatly misleading, it would set up an American Hitler. It is an outspoken enemy of the traditions of the American democracy, including those upheld by George Washington, whom it insulted by pretending to honor."

SLANT: We agree with the New York Times.

Good Books to Read

THE FASHION WORLD. This is the title of *American Agriculturist's* spring fashion guide. If you plan to do any sewing this spring, or if you want a concise and delightful guide to current styles, don't miss this little book. Its twenty-three pages are crammed with the most attractive patterns that we have seen anywhere. Here are some of the titles of page displays which will give you an idea of the scope of this book: "Dual Personalities" (dresses which do double duty by slight changes in accessories); "When Day is Done and Shadows Fall" (charming, easy-to-make evening dresses); "A Bride in Springtime" (with patterns for everything from bridal gown to underwear and nightgown); "The Two Piece Effect" (jaunty skirts and blouses); "They Keep Your Secrets" (dresses especially designed to flatter the mature figure); "Her Home is Her Castle" (spiffy aprons and house dresses); "Fashions for Fun-in-the-Sun" (adorable outdoor togs, slacks, play suits, sun-back dresses and suspender skirts); "Accent on Youth"

(up-to-the-minute styles for youngsters); "College Requirements" (just-right clothes for the college girl). For your copy of this smart spring fashion guide, send 12 cents to Pattern Department, *American Agriculturist*, 10 North Cherry St., Poughkeepsie, N. Y.

OVERBROOK TOWN SHOP RECIPES, Ruth Kellog McCurdy and Flora Sell Coan. Here is an attractive and interesting cookbook which has grown out of the experience of two Home Economics graduates, Ruth Kellog McCurdy and Flora Sell Coan. They ventured into the realms of hospital dietetics and teaching, and are now running a successful tea room in Scranton, Pennsylvania — all by way of saying that they are well qualified to give to the public reliable and popular recipes. Many of the recipes are given in both large and small quantities, making them useful both for the home and for community suppers. The beginner, too, will profit from the concise instructions and the tables provided for ready reference. The book contains twenty-two chapters covering everything from soups to desserts. Particularly timely during this Lenten season is the chapter containing delicious recipes for meat substitutes.—*Overbrook Town Shop*, 209 N. Washington Avenue, Scranton, Pa. \$2.00.

MASTER FARMERS Honored at Banquet

A CAPACITY crowd of over 500 saw Governor Lehman present *American Agriculturist* Master Farmer medals to five 1938 Master Farmers on Thursday evening of Farm and Home Week at Ithaca. At the same time 4-A medals were given to eight young people—two Juvenile Grangers, two Boy Scouts on farms, two 4-H Club members, and two high school students of Vocational Agriculture. A picture of Governor Lehman, the Master Farmers, their wives, and 4-A winners is shown on this page.

The high point of the evening was the reading of the citations by Governor Lehman. Space will not permit giving them in full, but here are brief excerpts from each of the Master Farmer citations:

JACOB PRATT:—"Mr. and Mrs. Pratt, I realize that your decision to return to the farm was not an easy one, but I am sure you have never regretted it. It has brought opportunity and happiness, and tonight it brings you this Master Farmer Medal, the highest honor that can come to a farmer."

H. N. KUTSCHBACH:—"Mr. Kutschbach runs a big farm, and runs it well, but that is not the reason why he was chosen as a Master Farmer. With Master Farmers small things count. For example, no man can be unfair to his help and keep two hired men for nine years as Mr. Kutschbach has done. No man can think of himself only and serve his church as Trustee and his County Farm Bureau as President."

GRANT HITCHINGS:—"When the trees are in bloom or at harvest time, when red apples hang from every limb, the 325-acre apple orchard on the Hitchings farm is a sight worth seeing. Before us tonight stands the man whose vision and industry made those orchards possible."

T. G. REYNOLDS:—"Master Farmers are home lovers. The desire to be with his family was the deciding factor which led Mr. Reynolds to an important decision. Twenty years ago he held a responsible position with a seed firm. On one of his trips, while lying ill in a hotel room, he, as he says, came to his senses and on his recovery, he bought the Washington County farm where he now lives. He has not regretted that decision."

C. C. DU MOND:—"In the management of a farm, efficiency is an important item, and size sometimes increases efficiency. However, Chester DuMond believes that size, like other good things, can be over-

done. He remarks that his 74-acre farm may be a bit small, but says: "If I enlarge it, I would be unable to maintain the outside activities which I contend are essential to any progress in the farming game. It seems to me that Farm Credit work and Farm Bureau work must be done by those who have actual farm problems to face, if this work is to have the greatest possible value."

Before the Master Farmer and 4-A citations were read, Editor Ed Eastman, acting as Toastmaster, read the following letters:

"Please extend to all my friends, old and new, among the Master Farmers my hearty greetings and best wishes for an enjoyable banquet and a happy and prosperous year ahead. I trust that their skill and industry and resourcefulness will be rewarded by returns commensurate with their splendid effort."

(signed) FRANKLIN D. ROOSEVELT.

"I hope you will extend my greetings and good wishes to all those who attend the Master Farmer dinner. I wish that it were possible for me to be present with them. Especially should I like to greet and wish further success and happiness to the Master Farmers, their wives and families, and to all the others present who are working so devotedly to better the lot of the good farming people of our State." (signed) HENRY MORGENTHAU, JR.

Several telegrams of greetings and congratulations to the new Master Farmers and 4-A Award winners were also read. The senders were: Henry A. Wallace, Secretary of Agriculture; L. J. Taber, Master of the National Grange; Harper Sibley, Chairman of Committee on Agriculture, U. S. Chamber of Commerce; F. F. Hill, Governor of Farm Credit Administration; Frank Gannett, Publisher of Gannett Papers.

Then Toastmaster Ed introduced a number of guests. Dr. Day, President of Cornell University, welcomed the visitors to Cornell; and H. L. Cosline introduced Master Farmers of previous years who were at the banquet. It is a source of pleasure to all concerned that each year so many Master Farmers of former years attend the banquet. This year the number was 36.

Nominations Wanted

Now it is in order for readers to make nominations of men to be considered as Master Farmers for 1939. Address *American Agriculturist*, P.O.

Box 367, Savings Bank Building, Ithaca, N. Y.

Here are the 1938 Master Farmers and 4-A winners with Governor Lehman. From left to right, front row: Kenneth Lambert, Irving Davis, Marjorie Thompson, Mrs. Hitchings, Mrs. DuMond, Governor Herbert H. Lehman, Mrs. Kutschbach, Mrs. Reynolds, Mrs. Pratt, and Thomas Wilson. Back row, left to right: John Lowden, Marion Tyler, Grant Hitchings, C. C. DuMond, Ward Burdick, H. N. Kutschbach, T. G. Reynolds, and Jacob Pratt.

Box 367, Savings Bank Building, Ithaca, N. Y.

In this connection, it is well to remember that, with rare exceptions, the men named as Master Farmers are at least fifty years old.

Selections are not made on the basis of financial success alone. Master Farmers are good farmers, but equally important is the community service they have rendered, educational opportunities they have given their children, and the standing of the men themselves in their communities.

Officers Elected

Master Farmers met for luncheon on the day of the banquet, and elected the following men as officers of the Association of Master Farmers of New York State: Fred Hollowell of Penn Yan, president; James Stone of Marcellus, vice-president.

Plans will be made for a summer tour for Master Farmers. Also discussed were possible plans for some sort of a memorial for deceased Master Farmers of which there are now six.

Earlier in the day the Board of Directors of the American Agriculturist Foundation held a meeting. The term of David Agans, Master of New Jersey State Grange, having expired, Harry Taylor, Secretary of the New Jersey Farm Bureau Federation, was elected in his place.

Porter Wins Duncan Award

To Roy Porter of Elba, N. Y., goes the H. S. Duncan Memorial Award for 1938. This is an annual recognition given to the man who, in the feeling of the Committee, performs the outstanding contribution to better marketing of New York State fruits and vegetables.

A year ago the honor went to the late Thomas Cross of Dutchess County.

This year honorable mention went to Alonzo Allen of Waterville, Grover Farley of Williamson, and Jay Gelder of Chazy.

Fast Axe Work

At the Farm and Home Week at Cornell, Archie Lobdell of Sullivan County, retained his title as New York State woodchopping champion. He broke his former record, established last year, by cutting through a 10" beech log in 37.2 seconds.

Other competitors in the finals were:

Martin Dinwiddie, Madison County, 40.2 seconds; Charles O. Bosket, Steuben County, 53.2 seconds, and Roy Wacenske, Monroe County, 1 minute 21 seconds.

In the 4-H woodchopping contest, state title went to William Murray of St. Lawrence County, who cut through a 6" beech log in 20 seconds. Edgar Pitts of Jefferson County was second with a time of 22 seconds; Ralph Betts, Schuyler County, third, 28.4 seconds; Peter Damin, Fulton County, fourth, 33 seconds; and Clifford Page, Tompkins County, followed.

The Outlook for Milk Prices

PART III.

By LELAND SPENCER.

AN unfavorable factor in the present milk situation is the high rate of milk production. During the latter half of 1938 and continuing to the present time the flow of milk has been larger than usual for the season, not only in New York, but throughout the country. A report just received from the U. S. Department of Agriculture states that milk production on February 1 this year was about 6 per cent larger than last year. On a per capita basis, U. S. milk production on February 1 probably was 2 per cent greater than the 10-year average for that date. That seems like a small increase, but with consumer buying power below normal, any increase in supplies is likely to have a depressing effect on prices.

In New York State, the Agricultural Statistician's office estimated milk production last month at 9 per cent more than the 10-year average for January. During the first six weeks of 1939, dairies delivering to Dairymen's League plants show an increase of about 12 per cent over the previous year and 15 per cent over the average for the years 1934-37. This is shown in the chart. Meanwhile, there has been some decrease in the number of dairies, but not enough to offset the larger deliveries per farm.

Unfortunately the high rate of milk production during the past year has not been matched by larger consumption, and the result is excessive storage holdings of manufactured dairy products. As of February 1, the total U. S. stocks of these products were more than

QUANTITY OF MILK SOLD DAILY PER FARM IN THE NEW YORK MILK SHED. In the latter part of 1938 and the first six weeks of 1939, production has been much above the normal rate. The number of dairies has decreased, but not nearly enough to offset the larger deliveries per farm.

double the normal quantities for that date.

There are some indications that this tendency toward oversupply of milk and dairy products may continue during 1939. The number of cows is increasing gradually, both in the New York milk shed and throughout the United States. Feed prices are low in comparison with milk prices, and there are ample supplies of hay and corn in the barns and silos. It is very likely, therefore, that farmers will feed their cows well and that milk production will continue above normal until the cows are turned out on pasture. After that much will depend upon the weather, but with normal rainfall during the summer, the larger number of cows being kept will tend to keep the milk flow above the average rate for past years.

New York Milk Price With Comparisons

	Jan. 1939	Dec. 1938	Jan. 1938

Pounds feed per 100 lbs. milk	142	154	141
* Net pool return without special location or upstate city differentials.			

Manufactured Dairy Products

Important to dairymen is a heavy output of manufactured dairy products which for December topped the preceding peak for that month. In December 9 per cent more creamery butter was produced than a year ago, 15 per cent more evaporated milk, 1 per cent more cheese, and slightly less condensed milk.

On February 1 butter in storage, including stocks held by Dairy Products Marketing Association, Federal Surplus Commodities Corp., and state relief agencies, totaled about 90,000,000 lbs. Last year total stocks were 31,000,000 lbs.

Butter prices are being maintained by purchases of the F.S.C.C., which, during January and February, purchased about 8,000,000 lbs.

Eggs and Poultry

From January 1 to about the middle of February receipts of eggs in New York City were approximately 14 per cent higher than last year and 30 per cent above the average.

On January 1 there were 7 per cent more hens and pullets in farm flocks than there were a year ago, but 5 per cent less than the 10-year average. Low January egg prices resulted in heavy marketing of laying stock. Consequently, the average size of laying flocks decreased 1 per cent during January, compared to a 1 per cent gain in January 1938.

Farm prices of eggs between December 15 and January 15 fell much more rapidly than normally.

A bill introduced in Congress and

referred to the Senate Finance Committee proposes to amend the tariff act by imposing on poultry and poultry products imported into the United States the same sanitary requirements of production now required for meat.

Reduction of storage stocks, including both shell and frozen eggs, for January was equivalent to 518,000 cases, a little more than half the withdrawals last year.

Potatoes

Recent talks with potato growers bring forth some pessimism. Dan Dean says: "Last fall many growers were more optimistic than I was. Now a good many of them are more pessimistic than I am."

The U. S. Department of Agriculture reports that the price of potatoes weakened slightly during January and early February. Carlot movement of old potatoes during the first five weeks of 1939 totaled 19,570 cars, as compared with 24,200 cars for the same period a year ago.

Reports from early and second early potato states indicate a reduction of 5 per cent in acreage compared to last year.

Apples

On February 1 cold storage holdings of apples were approximately 25 per cent less than last year. Movement out of storage during January was excellent, nearly equalling last year's figures when holdings were much heavier.

New York State holdings on February 1 were 3,460,000 bushels, compared with 4,434,000 bushels last year.

Up to February 11 carlot shipments of apples totaled 42,752 cars, not far below last year's figures of 49,837.

Livestock Population

It is time for the annual check-up on the New York State livestock population. Here it is, as of January 1:

	1938	1939
All cattle and calves	2,075,000	2,137,000
Horses	312,000	312,000
Sheep and Lambs	398,000	383,000
Swine	230,000	251,000
Chickens	13,211,000	14,030,000

Grass Seed Prospects

Briefly the following is what may be expected when you buy grass seed:

Timothy Seed.—About the same or slightly higher in price than last year.

Kentucky Blue Grass.—Slightly higher.

Orchard Grass.—About 25 per cent higher.

Red Top.—Little change from last year.

Red Clover.—Slightly lower than last year, but not as low as some previous years.

Alsike.—A big crop but a small carry-over. Prices probably a bit lower than last year.

Sweet Clover.—Probably considerably cheaper than a year ago.

Northern Grown Alfalfa.—A short crop and small carry-over will result in relatively high prices.

Market Briefs

On February 9 the Commodity Credit Corp. reported government loans on 4,228,000 bales of the 1938 cotton crop, which brought the cotton on which there are government loans up to nearly 11,200,000 bales. January cotton exports were the smallest for the month since 1872.

For the 1938-39 marketing year there will be at least 15 per cent more hogs for slaughter than the year 1937-38. A large increase in this spring's pig crops is expected.

The outlook for wool for the 1939 season is more favorable than it was a year ago. Domestic stocks of wool on hand December 31 were less than a year ago, and consumption for the first three months of 1939 are expected to be much larger than a year ago.

Strawberry acreage in early states is about the same as last year. However, second early, intermediate, and

late strawberry states all show substantial acreage increases.

Probably the supply of late winter and early spring truck crops will be smaller than a year ago. Some early crops have been delayed and some have suffered frost damage.

Secondary cabbage states indicate that acreage will be 12 per cent below a year ago.

Milk produced on the farms of this country now annually supplies nearly one-fifth of the total farm income. This is one-third greater than it was a generation ago.

Fighting Frost

(Continued from Page 6)

the curious vagaries that are observed in frost habits. For example, the average date of last killing frost is not greatly different between Oswego and points in the mountains of Tennessee and North Carolina. On the other hand, if one goes East from the Adirondacks to Cape Cod, the length of growing season, which is the number of days between last killing frost in the Spring and first killing frost in the Fall, varies from 90 or 100 days on the one hand to 200 days on the other. Thus, the relations of sea and land and mountain are as important as latitude. Also, there are important local differences. If May 4th is the date for Ithaca, the figure would have to be a week or 10 days later for some points within 20 miles or even less.

In an early issue I plan to discuss the use of various types of plant protectors.

Chopped Versus Long Hay.—Reported recently by Dairy Bureau were results of heating tests made on chopped alfalfa and on long alfalfa hay. Investigators stuck thermometers in the mows and found the chopped hay reached a high of 106° in 2 days then dropped to 76° in 16 days. The long hay went up to only 81° and then dropped back to 72° within 2 days.

As a result of these tests the experimenters stress the fact that only dry, well cured hay should be chopped. They have also done some investigating on fineness and believe that it should not be chopped finer than three-quarters of an inch.

The late Senator Perley A. Pitcher.

member of the State Senate for more than 14 years. He served as Chairman of joint Legislative Milk Committee to investigate the milk situation in New York State. He was fair and thorough, and performed a useful service to the dairy industry of the State.

The New York State Legislature recessed a week as a sign of respect to its member, and his seat in the Senate was draped in mourning. His funeral was held in Watertown on February 23.

The death of Senator Pitcher is a real loss to the State of New York.

Farm Machinery at Rochester

AT THE annual meeting of the New York State Horticultural Society at Rochester last January, there were constant crowds looking over the farm machinery exhibits.

On this page are four pictures snapped at the show. They are:

1. J. I. Case, with an exhibit of power-saving transmission.
2. Cleveland Tractor Co., where the young fellows enjoyed sitting in the driver's seat.
3. New Idca Farm Equipment, featuring a rubber-tired inclosed-gear mower.
4. Massey Harris, whose Clipper Combine attracted a lot of interest.

Salesmen in charge reported that interest was not inspired by curiosity alone. There were orders as well as interest.

NEARBY MARKETS for NEARBY POULTRYMEN

Changing Times By J. C. HUTTAR

I DON'T know about you, but I find that I make a lot of mistakes because of habits of thinking. What I mean is that at some time in the past I became firmly convinced that a certain thing was so. I still do a lot of my thinking on the basis that it is still just as true. Once in a while I find that times have changed and then (after a struggle) I give up the old idea and line up a new one. I suspect some of my readers have been caught the same way.

J. C. Huttar

For instance, some folks still talk about high winter egg prices and low summer prices. Others think of the relationship between peak prices in the fall and bottom prices in the spring as still being three to one. Some of these New York egg dealers here still think of our northeastern poultry business as "small pumpkins."

If you're just doing a lot of speculating, I suppose there's no harm what you think, especially if you get a lot of fun out of it. But, if your farming plans depend somewhat on your thinking, you'll have to do as I do and take inventory on your ideas as they crop up.

Market Changes

I've been saying lately that certain market changes, especially those affecting the market's judgment of egg value, come about through evolution. That is, roughly 40 years ago the price of eggs was pretty well set on age. Storage eggs weren't worth as much as fresh eggs, and eggs coming from the West weren't worth as much as those coming from New York and Pennsylvania into New York City. Later on the size of the egg was added to age, then color, and finally interior quality as measured by candling. Now age, among market men and within limits, of course, is fading in importance and actual quality is stressed more and more.

Other changes cannot really be called evolution, but rather a distinct shift of the facts. For instance January is no longer the month in which egg prices are highest, as it was years ago. It is now nearly the lowest.

Spring prices no longer go down so low, nor do fall or winter prices go so high as they used to. In 1915 to 1919, for instance, the average egg price in the lowest month (April) was only 45 per cent of the price in the highest month (November). But in 1937 the price in the lowest month (May) was 67 per cent of the price in the highest month (October). Those are monthly average figures. If you actually take the lowest and highest prices on any one day, thirty years ago it was three to one; now it's just about two to one. So it's not quite so important to get those fall and winter eggs as it used to be (but it's still a good idea). Relatively speaking, I would say that costs of producing eggs in the different months of the year and getting bigger total production are now more worth thinking about.

This last point—higher total production of eggs per hen—is now more important because of another change. Average egg prices for a whole year in relation to costs of producing them has

also been lowered. This is just another way of saying that it takes a better hen to earn her keep than it used to. There are more good layers so competition from hen to hen is also keener.

Still another change is that competition has increased greatly in certain classes of eggs. The best egg field is more crowded than it used to be in all our eastern markets. Not only has the heavy surplus of a big poultry industry on the Pacific Coast come into this field, but we here in Northeast have furnished ourselves with more competition. We've produced more eggs and we've made them better. This change has come about very fast in the last five to eight years.

In 1932, out of New York City's total supply of eggs, New York, New Jersey and Pennsylvania only supplied 11 per cent. But in 1938 these three nearby states supplied 22½ per cent. Quality also has stepped up along with better grading and packing in about the same period.

The net result has been that there isn't quite as big a spread between low and high priced eggs as there used to be.

"Well", you might say, "then why is all this holler about producing better and better eggs?"

Simply this. While the spread may not be quite so great, it's more necessary to get the extra cent or two a dozen because prices are lower in relation to costs. Furthermore, competition is greater in this field, and it takes more effort to stay on top.

1939 Markets

With changing market conditions, farm planning should be adjusted every few years, or maybe every year, if you're going to get all you can out of your chickens.

A few things that appear right on the surface for 1939 are these:

1. Brown eggs in the first half of the year, at least, look relatively poorer (compared to whites) than last year. What they'll do after Labor Day will depend on the number of "heavies" hatched this spring compared to Leghorns.
2. Hatch promises to be bigger and so the relation of egg prices to feed costs not quite so favorable. This means better stock to start and closer culling.
3. With more eggs to be marketed, a consumption campaign in the spring will prove very valuable. (I understand there is one planned by chain and independent grocers.)

These short-time guesses are not as reliable as the slow, long-time changes I spent most of my time discussing. Keep your poultry business adjusted to the long-time changes. That's where the thinking habits, such as I'm a victim of, are most apt to get you in "dutch."

"With her disposition I don't see what keeps her from laying hard boiled eggs!"

NEARBY MARKETS for NEARBY POULTRYMEN

The Hens That Die By L. E. WEAVER

EVERYONE knows that in recent years there has been a great increase in the number of laying hens that die. Everyone also knows that there has been an increase in the number of eggs laid by the average hen. It is not surprising that so many people take it for granted that the higher

L. E. Weaver

rate of production is the cause of the higher rate of mortality. To many people the fact that two things happen at the same time is sufficient proof that one must be the cause and the other the effect. Fortunately that is not necessarily true. Fortunately, too, some folks think more clearly and demand better evidence before making any

conclusions.

In this case evidence has been piling up that high production is *not* the cause of high mortality. On the contrary, the facts seem to be that only vigorous, healthy hens can lay at a high rate; and because they are vigorous and healthy, they can also continue to live.

We lose more layers than we used to because we have more weaklings in the flock. We don't cull them out when we put the pullets in the laying house because no one has ever learned how to spot them. They all look strong and vital and husky, yet many are doomed from the beginning because they are members of families with low natural resistance to certain diseases. They won't be able to survive.

At the Illinois Experiment Station they went back over the daily egg records of all the pullets that died. They found that up to the time of their deaths these pullets had laid fewer eggs than the survivors had laid in the same period. It was the low producers that were dropping out. They decided that the same lack of vigor that resulted in early death for the pullets had also held them back in their laying.

At the Kimber Poultry Breeding Farm in California the records are kept on complete families. One of their best males had 157 daughters that averaged 245 eggs each for one year. That is a marvelous record for high-speed laying, yet the first-year mortality among the daughters was only 4.4 per cent. One of their poorer males had 62 daughters that averaged 186 eggs each. The mortality was 21 per cent in this group. On this farm the records show that high production and low mortality tend to go together.

Professor F. C. Elford, Poultry Hus-

bandman for the Dominion of Canada, has recently made a report on a careful review and analysis of their laying contest data. The report states that the majority of deaths occurred in the lower producing pens and that mortality among hens laying at a high rate was less than among the low rate birds. While it is true that the season of highest production is also the period of greatest mortality, yet there was no evidence that "the strain of heavy production shortens the lives of the pullets."

What is the Cause?

One authority blames the modern incubators, brooders, and improved rations for the trouble. He says that these are doing their jobs too well. Hundreds of weakling chicks are hatched today that, in the old days of 50 per cent hatches, never saw the light of day. They are then coddled and pampered to maturity. It is true that today we get better hatches and lose fewer chicks in the brooder than a few years back. Perhaps we have suspended the law of natural selection to a certain degree, so that there is a survival of the unfit along with the fit. It sounds very possible, but here again I prefer to withhold judgment until more evidence is presented.

Chicks from Older Hens

At the end of a year of laying, most of the weak sisters will have passed out of the picture. Natural selection has been operating. The yearling hens that have survived have proven that they can lay and live for at least one year. There should be fewer weakling, short-lived pullets produced from such a flock than from a flock of pullets.

At the Ohio Experiment Station they found that pullets from hens laid a great many more eggs than pullets from pullets. The same was true the second year also.

Breeding for Disease Resistance

The time has not arrived, but is on the way when you can get chicks sired by older males that have proven their ability to pass on to their daughters high resistance to the ordinary things that kill pullets.

Visitors at Cornell's recent Farm and Home Week saw on exhibition two White Leghorn males. One had produced 132 daughters. Of them, 72.7 per cent died before they were 500 days old. The other male had 122 daughters the same year. Only 37 per cent of his daughters died in the same period.

The same difference was shown another season when the males were mated with other hens. Of course, 37 per cent is not exactly low mortality, but it does show that some families may hatch well, grow well, even lay well, and still carry a natural weakness that makes them easy victims of early death. The moral is: "Watch your step when you buy your chicks."

This "pretzel" egg was laid by a White Leghorn hen at the Western New York Official Egg-Laying Test at Stafford, N. Y. It is shown here compared to a normal egg. Maybe the hen was fed on beer mash.—LeRoy Fess.

Phen-O-Sal Tablets are based on Dr. Salsbury's original poultry prescription. They are recommended by dealers who display the emblem shown below. Always demand GENUINE Dr. Salsbury's Phen-O-Sal Tablets. Look for the package and trademark shown below.

Dr. Salsbury's
POULTRY HEALTH
SERVICE STATION

Your hatcheryman has done all in his power to make sure the chicks you buy from him are strong and healthy.

Carry on his good work! Give your chicks the benefits of Phen-O-Sal in their drinking water. It's the tried and proved medicine—a balanced blend of antiseptic* and astringent drugs.

Every Phen-O-Sal Tablet is uniform in quality and composition. That means accurate dosage! And Phen-O-Sal Tablets dissolve in just a few seconds—so your chicks get the full benefit of the medicine whenever they drink.

Get Phen-O-Sal Tablets for your chicks today! See your Dr. Salsbury dealer.

*As proved in bacteriological inhibition tests in our research laboratory.

One Extension Man

works in

6 Different States

"Steve" Walford, B.S.A., used to be an R.O.P. Inspector, then for seven years was Extension Poultryman in Southern Indiana. Since 1936 he has been "extension man" for Hall Brothers Hatchery, working intensively with our Flock Owners throughout New England.

Now in New England, poultrykeeping has become a good deal of a fine art, as well as a profitable agricultural enterprise; and Hall Brothers' policy of high hatching egg premiums has attracted the best operators in the profession. In addition, a system of bonuses for high hatchability has further encouraged the best possible attention to these choice flocks. "Steve's" past experience not only enables him to pick the best flocks available, but also materially to help maintain or improve the quality of their output.

Almost anybody would be glad to hire such a man to choose for them the source of their chicks. And you do set him to work for you when you buy Hall's Chicks.

"Steve", backing up our bonus policy, is just one of the many reasons why

Hall's Chicks are Better

and why they should make more money for you.

Send for our new free catalogue—get some of these BETTER chicks—compare them with any others you may fancy—and see for yourself how profitable they will prove on your plant under your own methods.

Your Spring WARDROBE

by
MRS. GRACE WATKINS HUCKETT

COATS and suits are distinguished this season by tweeds in many patterns in gay colors which ordinarily we have not associated with such sturdy fabrics. Also there are the water color tones, grayed pinks and blues to complement the more vivid colors. Striped tweeds are slimming in their effect; many suits and coats are smartly collarless. Smart bold plaids have strong appeal for the younger set. Sheer woolens are porous in texture, yet we see many versions of twills, tricotines and gaberdines.

Navy is the most important blue. Other blues vary from aquatone to the vibrant royal blue. Pinks range from soft cameo tones to deep raspberry. Violet appears from mauve to fuschia. Beige, either putty or twine, is a classic for all spring suits and coats, while rosy brown is high fashion.

Coats gather many details and silhouettes from 1900, with youth and femininity as the theme. Slimness is emphasized, shoulder details are smoother, sleeves roomy and a definite swing at the back for loose coats. Fitted coats often have close fitted collars, circular set-in gores, giving an umbrella fullness.

The short top coat is very convenient to wear over suits or dresses. Everywhere are pockets, many of them in varied forms. Belts are either narrow or wide and crushed. Not much fur appears on coats.

As for dresses, the basque silhouette is new; the princess silhouette is extremely popular. Waistlines are lower.

The turn of the Century, the 1900's, Americana, and feminine charm are the keynotes for dresses. Jacket dresses are big news. They embrace every type and combine the uses of all fabrics

and colors. Sheer woolen dresses are perfect for street. They combine new color and soft sheer materials. These new woolens have a silk-like finish and are crush resistant. One-piece dresses are often trimmed with lingerie and lace, or with touches of colorful plaids on black and navy dresses.

Prints are daintier, with patterns moderately spaced, color on color, often with unexpected touches of white or with daring color combinations. The daintier patterns are for daytime, the larger floral patterns for evening.

Navy with white or color holds first place. Gold from pale yellow to deep burnt gold casts is also among first-family colors. Chartreuse and sage green also hold high place. The rose family ranges from lollypop to spring wine; fuschia, lilac and mauve to purple tones continue on the color calendar.

The wasp waistline is definitely here,

3184
SIZES 12-40
HAT AND
APPLIQUE
INCLUDED

as are brief fitted jackets, snugly fitted necklines and skirt fullness which begins below the hips. The majority of sleeves are short with slightly squared or rolled shoulder. We also see the bell sleeve which reaches below the elbow. Skirts flare, due to gores, fan pleats, or straight pleats stitched to below hip-line. The fuller the skirt, the shorter it is, averaging 15 to 16 inches above the floor.

Belts are wide and often crushed; ornaments consist of clips, or large bunches of colorful flowers worn preferably on belts.

Necklines vary, being heart shaped, softly draped or low, some square with white pique or lingerie to lend interest. The new, low oval necklines enhance the many-strand necklace which has found high favor. In shirtmaker dresses which still lead in favor, necklines are high. Some shirtmaker types affect two fabrics. Little girl collars are very good.

Creme dinner dresses are often the basic type with many versions of accessories. Marquisesettes, chiffons, laces, sheer crepes, printed chiffons or combinations of materials are used. Much lingerie and much eyelet embroidery with velvet and faille ribbon drawn through beading will be noted. Taffeta bands also are used on marquiesette dinner dresses. Crease resistance in spun rayon and cotton fabrics, color and blending of colors, sometimes as many as three of them, make spring styles exciting.

In sportswear, sharkskin is good for the classic tailored types. Surah which we often see is a good fabric to express Early American feeling. Nubby rayon especially in the hopsacking group is good in prints and in solid colors. The spectator type dress is very soft, using

Above—

NO SPRING STYLE is in higher favor than the princess, especially if accompanied by a charming little bolero. When a perky little hat is included, then the outfit is complete.

Pattern No. 3184 includes dress, jacket and hat, and comes in sizes 12, 14, 16, 18, 20 years, 30, 32, 34, 36, 38 and 40-inches bust. Size 16 requires 3½ yards of 39-inch material with ¼ yard of 35-inch for applique for dress and hat; and 1¾ yards of 39-inch material for bolero.

much shirring, smocking, pleats and tucks. Belts and buttons are the most important trimming accessories.

Blouses are extremely important with suits. Satin especially in pure dyes and in white will be high fashion. Crepe, surah, paper taffeta, the sheers and lingerie fabrics enter into the blouse picture.

Jackets also highlight the spring season. They may be bolero, or waist length; some are gathered into a broad belt at the waist. The new boleros are short with a new soft shoulder look. Many have a matching cummerbund or broad waistband. Sheer wool flannel jackets with allover rhinestone designs and zipper closings are beautiful for afternoon and evening wear.

Petticoats of gay taffeta and prints or even with an embroidered cotton or batiste ruffle, emphasize the 1900 idea. Even nighties and other lingerie are made of cotton trimmed with laces, frills and flouncing.

In hosiery, copper tends to lead or suntones, but not the carrot or orangy tones of the autumn. There are new beiges and also some winish tones to go with fuschia.

Right—

EVEN little sister likes her skirts full. Equally pleasing to her will be the little bolero jacket which she can slip off and the sweet blouse with little girl collar. Navy and white plaid skirt buttoned on to a white or yellow cotton blouse with navy blue wool jacket would make a picturesque combination for any little girl.

Pattern No. 2077 is designed for sizes 6, 8, 10, 12 and 14 years. Size 8 requires ¾ yards of 39-inch material for bolero; 7/8 yards of 39-inch material for skirt; and 1½ yards of 35-inch material with 2¼ yards of ruffling for blouse.

Jacket-dress No. 2847 presents one of the spring's very best styles. The skirt has slim, straight lines, the bodice is becomingly soft while the long bolero is most flattering. It may be made up as a dress and jacket or as skirt and jacket with separate blouse. Pattern sizes are 14, 16, 18, 20 years, 32, 34, 36, 38, 40, 42, 44, 46 and 48-inches bust. Size 36 requires 3¾ yards of 39-inch material with 1¾ yards of 35-inch contrasting.

TO ORDER patterns shown on this page: Write name, address and pattern size and number clearly and enclose 15c in stamps. Address Pattern Department, American Agriculturist, 10 North Cherry St., Poughkeepsie, N. Y. Add 12c for a copy of our new Spring Fashion Catalog.

The A. A. Cooking School

by
Mrs. Grace Watkins Huckett

LESSON XII—Puddings

THE term "puddings" belongs properly to those desserts using flour or some other cereal as a basis. This flour may have been already baked, as in bread, cracker or cake crumbs.

Since puddings, especially the hot ones, are among the most filling of all desserts, they are best served during cold weather, and the rest of the meal should be made correspondingly lighter when pudding is the dessert. Puddings vary from the easily digested cornstarch pudding, creamy rice pudding and similar ones to the rich, heavy-fruited plum pudding. Even children or people with frail digestions could well enjoy the former, whereas the latter should be fed only to those whose digestions are unimpaired.

Puddings are boiled, steamed or baked. Boiling is less common now than when a pudding bag or cloth was part of the equipment in every kitchen.

For steaming, a slow process usually requiring hours, the molds should be greased, filled two-thirds full of the mixture, and covers fitted on tightly to prevent steam from dropping on the pudding and making it soggy. Also, keep the cover on the steamer to prevent chilling the pudding. This is called moist steaming and is necessary for heavy puddings or those containing citron or dried fruits. Dry steaming is done in the top of a double boiler. This is necessary for custard mixtures, which curdle or the egg is toughened

at too high temperatures. Baking is quicker than steaming, but is apt to make the pudding dry.

The binding material in some puddings is a batter. Plum puddings, and other batters with fruit mixed in, belong in this group. So do cottage puddings which are merely a plain cake served with a fruit or other sauce. Upside-down cake is another variation of the batter and fruit combination.

Other starchy substances used to bind puddings are rice, tapioca, oatmeal, flour or cornstarch. These are cooked on top of the stove or in the oven. In many cases the cereal is supplemented by a custard as thickening

cream or a sauce made of the cherry juice thickened with cornstarch. If the latter is used, allow 1 tbsp. cornstarch, 4 tbsps. butter, and 1 cup sugar to 1 cup liquid. If canned cherries are used, sugar should be added to taste.

Other canned fruits or berries may be substituted for cherries, and a sauce made from the juice. Add lemon juice to the sauce for less acid fruits.

Carrot Pudding

1 cup ground raw carrots	1/2 tsp. soda
1 cup ground tart apples	1 tsp. baking powder
1 cup raisins	1 cup flour
1/2 cup brown sugar	1/2 cup bread crumbs
1/2 cup molasses	1/2 tsp. nutmeg
1 cup ground suet	1/2 tsp. cloves
	1/2 tsp. cinnamon

Mix all ingredients together, put mixture in mold or molds, and steam for 2 1/2 hours. Serve with cream sauce, made as follows: Cream together 2 tbsps. butter and 6 tbsps. powdered sugar. Fold in lightly 1 cup whipped cream. Flavor with 1 to 1 1/2 tps. vanilla extract and serve at once.

Butterscotch Pudding

3 cups milk	2 or 3 eggs	1/2 cup butter
3/4 cup flour		1/2 tsp. salt
1 1/2 cups brown sugar		1/2 tsp. vanilla

Make a thick white sauce by melting the butter, blending in the flour and salt and adding the milk gradu-

End of A. A. Cooking School

THIS is the last lesson of the *American Agriculturist* Cooking School, and we have an important announcement to make. Many of you have asked us to print the answers to questions asked with each lesson. To do so will take quite a lot of space, but we feel that a collection of brief questions and answers, covering our cooking school lessons, will be so useful to all of our women readers that we have decided to publish these in an early issue. There will be at least three whole pages of these questions and answers. Cut them out and save them, with the original twelve lessons, for permanent reference.

Many of you wrote us that you would appreciate a lesson on cookies, but we have decided not to include this in the cooking school. Later, Mrs. Huckett will prepare a special article on this subject, with recipes.

As soon as we have had time to grade all examination papers, contestants who have a grade of 85 per cent or over will be notified and asked to write a letter on "How the *American Agriculturist* Cooking School has helped me to be a better cook." Final choice of winners of cash prizes will be based on these letters.

After the final date when all papers must be in (March 18), it may be several weeks before contestants will receive further instructions from us. Please be patient, as we still have a tremendous amount of work to do here in the office before all papers are graded.

We hope that you have enjoyed our cooking school and that you have gotten a lot out of it. It has meant much extra work for Mrs. Huckett and for our office staff, but the hundreds and hundreds of nice letters that we have received from contestants have made us feel more than repaid.

agent. When eggs are used, they should be added after the starch has cooked thoroughly, first pouring some of the hot mixture on them, and then combining both mixtures. This prevents streaking. Only two or three minutes extra cooking should be allowed after eggs are added.

Allow two tablespoons cornstarch to each cup of milk and twice as much flour for the same quantity of milk in making a substitution. One egg is equal approximately in thickening power to 1 tablespoon flour or 1/2 tablespoon cornstarch.

It is very important to separate the starch grains before hot liquid is added; otherwise disastrous lumping results. Blend thoroughly the flour or cornstarch with the sugar, then pour the hot liquid on it. Other ways to prevent lumping are to blend the starch with cold milk or water or with fat. If egg is used, part of the sugar should be blended with it.

Cherry Pudding

1 cup pitted cherries	1/2 tsp. salt
1 1/2 cups flour	1/2 cup milk
3 tps. baking powder	1 egg
1/2 cup sugar	1/4 cup shortening

Sift flour with baking powder. Cream shortening; add sugar, salt and egg which has been well beaten. Add the flour and milk alternately to this mixture. Place fruit in bottom of greased baking dish and pour pudding batter over it. Bake in moderate oven, 375°-400° F. 30 min. This pudding may be served with a hard sauce, whipped

ally, stirring constantly to prevent lumping and sticking. When it thickens, place over hot water and cook covered 30 min. Remove from fire, stir in sugar, beaten eggs and vanilla. Beat until thoroughly blended. This is a very wholesome and simple pudding. Serve with plain or whipped cream.

Variations: 1—Eggs may be omitted. 2—Add 1/2 cup broken nut meats.

Steamed Apricot Pudding

1/4 cup butter	1/2 cup milk	2 eggs
1/2 lb. dried apricots		1/2 cup sugar
1 1/2 cups sifted soft-wheat flour		2 tps. baking powder
		1/4 tsp. salt

Wash apricots, chop fine, and mix with 2 tbsps. of the flour. Sift remaining flour with baking powder and salt. Cream fat, add sugar, and well beaten eggs, and add alternately with milk to the sifted dry ingredients. Stir in apricots. Pour into greased mold, cover and steam for 2 hours. Serve hot with hard sauce.

New England Pandowdy

Fill a deep baking dish with peeled and cored tart apples; any sweetened, stewed, canned or fresh fruit may be used in place of apples. Add 1 or 2 tbsps. water to make a little juice, sprinkle with granulated or brown sugar, season with nutmeg or cinnamon and cover with a baking powder biscuit crust. Bake in a 350°-400° F. oven. Serve with a sauce of thick cream well sweetened with ordinary sugar or scraped maple sugar.

To Get the Best Cough Medicine, Mix It at Home

Saves Good Money, No Cooking.

This famous recipe is used by millions of housewives, because it makes such a dependable, effective remedy for coughs that start from colds. It's so easy to mix—a child could do it.

From any druggist, get 2 1/2 ounces of Pinex, a compound containing Norway Pine and palatable guaiaicol, in concentrated form, well-known for its effect on throat and bronchial membranes.

Then make a syrup by stirring two cups of granulated sugar and one cup of water a few moments, until dissolved. It's no trouble at all, and takes but a moment. No cooking needed.

Put the Pinex into a pint bottle and add your syrup. This makes a full pint of cough remedy, very effective and quick-acting, and you get about four times as much for your money. It never spoils, and is very pleasant in taste.

You'll be amazed by the way it takes hold of coughs, giving you quick relief. It loosens the phlegm, soothes the irritated membranes, and helps clear the air passages. Money refunded if it doesn't please you in every way.

QUESTIONS

(Send your answers to the following questions to *American Agriculturist* Cooking School, Box 367, Ithaca, N. Y., not later than March 18.)

- 1—How is a pudding distinguished from other desserts?
- 2—What precautions in cooking must be observed if the pudding also has a custard base?
- 3—Name 5 puddings using batter as binding material.
- 4—What cooking processes are used for cooking puddings?
- 5—If there are children in the family, what types of puddings should be emphasized?
- 6—Make a menu suitable for family use when carrot pudding is the dessert.
- 7—If you thicken your cherry pudding sauce with flour instead of cornstarch how much flour would you use?
- 8—If you preferred to thicken it with egg, how much would be needed?
- 9—Give as many reasons as you can think of for including fruits in puddings.
- 10—Is pudding a popular dessert with your family? Name any particular favorite.

The Dark Day

THERE have been several "dark days" and "yellow days" since the famous one of May 19, 1780, which spread such consternation and foreboding throughout New England; but none of them have equaled it in depth of gloomy obscurity. A strange darkness came on before midday, and for sixteen hours or more the people of New England believed that the end of the world was at hand.

Among many other attempted explanations, put forth at the time and afterward, one was that a comet, passing near the earth, had brushed its "tail" through our atmosphere. One savant attributed it to a hypothetical volcanic eruption in Labrador; still another to an unprecedented rarefaction of the air over North America, causing all the suspended particles of dust and smoke to settle in a zone near the earth's surface.

* * *

LYMAN MORRILL was the first white man who cleared land and built a log house in Waynor, Maine, and this is the story of the adventure which befell him while bringing his young wife and child here in the spring of 1780.

The War of the Revolution was still dragging on; and young Morrill, whose home was near Exeter, N. H., had served as a soldier. He had risen to be lieutenant. At Germantown he was wounded and captured by the British, who after keeping him a prisoner for some two months in Philadelphia, finally sent him to a jail in New York City, where gangrene and ship-fever prevailed to such an extent that nearly all the prisoners died. Morrill was carried out one morning for dead, or dying. He revived in the pure air and crawled to the house of a Dutch family, where he was cared for in a kindly manner for several weeks.

At last he started to walk home, but fell very ill again on the way, and was taken in by a farmer named Hastings, who lived near Reading, in Massachusetts. During his illness he was nursed by the farmer's daughter, Ruth. A warm attachment sprang up between them, which resulted in marriage the following summer.

The necessity of having a home of his own now presented itself; and being without means,—for his Continental money had now depreciated nearly to zero,—Morrill with two other young men came to Waynor, of the soil of which good reports had reached him. During the season of 1779 he cleared ten acres of land on the slope west of Great Pond, and built a log house.

As winter came on, he returned on foot to Reading; but April found him again at his clearing in Waynor—to see how his new homestead had wintered. After a few finishing touches to the cabin, he went back to bring Ruth and the baby, a boy ten months old, and already named Lafayette.

The young mother made the journey on the back of a white mare, carrying little Lafayette in her arms, and having behind her a huge bundle of bedding and a web of home-made cloth, all tied up with a bed cord. The lieutenant walked behind with his gun. From the last house, which was permanently inhabited, they had 20 miles to go to reach the new cabin, and as yet there was nothing in the way of a road but an indistinct trail indicated by blazed trees through the forest. On the morning of May 19th they set off from this stopping-place in expectation of reaching their new home by mid-afternoon.

The morning was calm and warm, but somewhat smoky, as is often the case at this season of the year. A

slight shower, accompanied by a few peals of thunder, passed over from seven to eight o'clock. Dense low clouds seemed to be gathering, and Ruth urged making haste. At best, however, the mare was a slow walker and the path difficult.

"How strange and dark the woods look!" she said, anxiously.

"Yes, it is very cloudy," Lyman replied.

"Is night coming on, Lyme, or what is it?" Ruth exclaimed.

By C. A. STEPHENS

"Oh, no, it can't be night. It isn't noon yet," he replied.

"But all the birds have stopped singing. And the frogs have begun to peep just as they do after sunset."

In fact, the shadows had so deepened that it was only with difficulty that the young pioneer could distinguish the ax spots on the trees at intervals. A sense of dread stole on him, but he sought to reassure Ruth.

To keep the mare in the path, Lyman was soon obliged to go in advance and lead her by the bridle. Peering ahead, he sought to discern the white spots on the trees, but soon it was so dark that he could not distinguish one tree from another, and drew up in bewilderment and apprehension. For if they were to lose the trail through that little-trodden wilderness they might become lost altogether and perish from starvation.

"Ruth," said he, soberly, "we had better stop here and camp till the clouds break away. I will build a fire; we can eat our luncheon."

"Oh, no, no!" she cried. "Don't stop here. Let's go back to that house where we stayed last night, where there are some people. Oh, don't let's stay here! It may never be light again. Lyman," she added, solemnly, "perhaps

it's judgment day. Perhaps it's the end of the world."

"But I am afraid, Ruth, that we cannot find the way back," the young husband remonstrated gently.

"Oh, we must, we must! We mustn't be all alone, away off here, if it is judgment day! Oh, let's go back where we can see somebody!"

Her fears moved the heart of her husband and he turned the white mare. So great was the obscurity that he could now see hardly anything, but groped back along the path, leading the mare and feeling for the spots on the tree trunks which marked the path. To Ruth the progress seemed interminable, for her heart was filled with apprehensions. Little Lafayette waked and cried uncontrollably. His mother's terror appeared to communicate itself to his infant mind. His wailing sounded strangely in the darkened forest; and presently an owl came about them, hooting dismally.

The young man was a prey to grave anxieties, which, however, he kept to himself. He could no longer find spots on the trees, although he passed his hand along the trunk of every one as he came to it. He felt sure that they had strayed off the trail; and yet there appeared to be a path which the mare followed without hesitation. He could not understand it.

In point of fact, as they found out afterward, they had strayed off their road, but had stumbled upon another foot-path, used by Indians and white hunters, leading to and from a chain of ponds in the western part of what afterward became the town of Waynor.

But paths usually lead somewhere, and it was better, he said to himself, to be in a path than adrift in the forest. This one might possibly lead to a settlement or a hunter's cabin. So he said nothing.

They groped on and on, and after a weary while they came to the reedy shore of a pond; yet so profound was the obscurity about them that the young pioneer was not aware it was a pond until he stepped down fairly into the water.

Ruth now cried out that they had lost their way.

"I am sure we came to no such place

The limit in length is sixteen (16) lines and poem must be original and written by an amateur. \$2.00 will be paid to the author of each one printed. Check will be mailed on or about first day of month following publication.

Send poems to Poetry Editor, *American Agriculturist*, P. O. Box 367, Ithaca, N. Y.

Winter Sunset

I gazed one day at leaden skies
'Gainst which bare trees did branches lift,
When suddenly upon the dreary scene
There burst the wonder of God's gift.

For lo! at sunset time the sky
Awoke and turned from gray to blue,
While branches erstwhile drab took on
With all the earth a golden hue.

God grant whene'er our winter comes
And youth and beauty both must go,
Reflecting God's own grace we'll be
Transfigured in life's sunset glow.

—Marian Combe Ashley,
537 Essex St.,
Beverly, Mass.

as this on our way up," she said. "Where are we, Lyman?"

Lyman could no longer conceal from her that they had gone astray. He groped about, however, and finding that the path extended along the shore of the pond, he set off to follow it again, in the hope, as he told Ruth, that they would soon come to a settler's house.

The trees here were all large pines, standing a little distance apart, so that the mare made her way without difficulty; and so soft was the carpet of dry pine-needles that her hoofs made no noise.

They had gone on for a mile or more when a singular sound was heard, very faintly at first—a sound as of mourning, or low, doleful singing. Ruth heard it first.

At last the young man distinguished the noises, and said that to him it seemed like cocks crowing lustily a great way off; but Ruth insisted that it was singing that sounded much like "Old Hundred."

"It's people," she said. "They are holding a prayer-meeting. Oh, do let's hurry! I want to be there."

Morrill was not so certain of this, but he led the mare on among the pine trunks as fast as was prudent; and soon they saw the red glow of a fire not far off. What had seemed singing, however, had now changed to low groaning sounds.

But Ruth asserted that the people were at prayers.

"They have sung a hymn!" she cried. "Now the minister is praying."

Morrill led on, but soon the light disappeared, owing to an intervening hillock or rock; and now they caught but a faint glimmer of it aloft on the pine boughs.

The strange groaning sounds continued, however, and became more distinct. They were like the syllables "Ah-deo-mo-na-bee-ah," slowly repeated.

Morrill did not know what to think, but continued leading the mare nearer.

Suddenly he passed the base of what seemed to be a very large rock, and found himself close to a large camp-fire of logs smoldering low. Near it there were two cabins of white birch bark, and on the ground in front of these cabins lay a number of dark forms, apparently human beings, face downward, groaning dolorously.

But at almost the same moment that Morrill discerned them they all started up, having probably heard the jar of the mare's feet. There were 10 or 12 of them. They sprang up as if electrified, staring spellbound. For there, close at hand in the dim firelight, stood the white

The Song of the Lazy Farmer

WHEN I was young the women wore a lot of clothing on before and twice as much as that behind, but now it seems that they don't mind a-goin' 'round with ev'ry knee in plain sight for the world to see. It used to be a cause of shock if you should glimpse a piece of sock, but now bare ankles ain't no treat; in fact, you see a lot of meat where'er you go, for folks expose more than they cover up with clothes. The bathin' suits girls wear today would make my mother faint away, when she was fixed up for a swim you couldn't see a leg or limb. But nowadays competition's keen to let a lot of hide be seen. Just why the women want to show bow-legs or swaybacks I don't know, the most has got so many flaws they ought to wear more clothes because their clothes is prettier than them; when covered up with stitch and hem they don't look bad, but what a fright

they are when they're exposed to sight!

If we could make them women see how better lookin' they would be with plenty clothes hung on their frame to cover up the faults of same, we'd have a market for our wool, we wouldn't have to plow and pull our cotton, for the market would in that case surely be quite good. This farmin' job would be less tough if women only wore enough, the skirts they wore in mother's day would sure make cotton raisin' pay; the clothes she wore, both thick and full, used up an awful lot of wool. Prosperity will come again if women listen to us men, and hide their blemishes from view, and cover up their legs, in lieu of struttin' round for all to see their bunions and their corns, by gee!

mare, with Ruth and the great bundle of light-colored bedding on her back.

Beyond doubt it was a startling apparition to these simple Indians, alarmed as they already were by the mysterious darkness that had fallen at midday.

Be that as it may, panic fell on the Indians when they sighted the white mare with the white woman and her child on its back. With wild outcries, squaws, hunters and papooses fled away into the forest.

Ruth had seen them and cried out in alarm; the child, too, had begun to shriek loudly; and between the fears of his own small family and the panic of the Indians, our young pioneer hardly knew what course to take.

The Indians at that time were neither hostile nor very friendly, but Morrill knew something of this remnant of the tribe that lived about these ponds. One of them, named Squanto, had come several times to beg salt while Morrill was clearing land. They had managed to converse a little, for the Indians then had learned many English words, such as gun, salt and powder, which they called "pood." In such an emergency it was necessary to make friends with them, or at least to avoid hostilities.

Morrill therefore followed after them a little way, and called to Squanto by name.

"Squanto! Squanto! Me Morrow!" he called out. (Morrow was the Indian pronunciation of Morrill.) "Morrow squaw! Morrow papoose!"

He could hear the Indians at a distance; but for a long time none of them would answer. Finally Squanto said, "Ho-ho, Morrow!" and came slowly back, looking a little sheepish.

For some minutes he stood regarding the white mare and the white woman in silence. Then the Indian grunted "Ho, Morrow, you squaw!" and poked the young white man in the side good-humoredly.

Squanto then shouted reassuringly to his own squaw and to the others; and one by one they came back, but all took care to give the old white mare a wide berth. Morrill hitched her at a little distance, then brought Ruth and the baby to the fire and spread the bedding for her to sit on.

It was evident that the unusual darkness had greatly disturbed the Indians. Squanto now and again passed his hands before his eyes, then extended them north and south, shaking his head, to indicate to Morrill that something very ominous was occurring in the heavens.

Morrill, however, was trying to make his young wife more at her ease. Poor Ruth had never seen many real Indians, but had heard the worst accounts of them. She sat hugging her child close, stealing fearful glances at the dark faces. Moreover, she was sadly homesick; and for the moment she no doubt regretted following her pioneer husband into such a savage wilderness.

Squanto's squaw stole forward and gently patted Ruth on the shoulder, uttering low Indian words, intended

The World Shut Out

By Queena Davison Miller

He gathered bricks and piled them high
To build a wall about
And make a secret place to dwell,
With all the world shut out.

But when the wall was built at last
About his little room,
He found himself imprisoned fast
Within a darkened tomb.

only for her ear. Seeing, too, that the young white woman looked very tired, she presently extended her arms to take the heavy, sleeping child. After some hesitation and a reassuring word from Lyman, Ruth surrendered him to her. The squaw sat on the ground beside her and swayed the infant gently to and fro.

Later in the afternoon, or evening,—for they had little idea as to the time of day,—the squaws spread a wonderfully soft bed of boughs and skins in one of the bark cabins for Ruth and little Lafayette; and they passed the night there not very uncomfortably.

The next morning the sun rose about as clear as usual, although the sky continued smoky, as it had been for a week or more. During the forenoon Squanto and his squaw went with Morrill and Ruth to their clearing, by a path the Indians knew, the distance being about eleven miles.

These Indians often came to Morrill's house. About two years later Squanto went to Canada and was killed in a brawl; but his wife was a frequent guest at Ruth's table for thirty-five or forty years.

Today in Aunt Janet's Garden

Do Re-furbishing Now

BEFORE leaves come out, trellises ought to be straightened and painted if they are to get such a treatment this year. Vines which need cutting back or tying in place can be attended to now. Incidentally, hardwood ashes are recommended as fertilizer around grape vines. Roses, delphiniums and bearded irises also profit from such an application. The ashes should have been kept dry, of course.

Early spring is the best time to give the lawn the once-over—fertilizer or top dressing, rolling and reseeding the bare spots. Raking off the dead grass is better than burning it off. Lawn work usually requires a man's strength, but sometimes the incentive to exert it has to be provided by the lady!

While casting your eagle eye around for frost damage, any plant which has been heaved up may be pushed back gently with the foot. Strawberry plants or others with shallow spreading roots are most apt to suffer. Any newly set plant needs special inspection.

The urge which comes on a bright, sunny day to get out and dig up the earth has to be controlled; otherwise more harm than good may be done. The good old test as to when the soil is ready for digging is to squeeze a handful. If it clings together, it is too wet. If it crumbles apart, then go ahead.

Mulch should be removed gradually. Too sudden exposure may prove fatal to young and tender growth. Early spring is a good time too, to set new roses while they are still dormant. By doing this, bloom the first year will result, if the planting is carefully done. The dormant roses are cheaper than the potted ones which come on the market later.

SELLING MILK

.. to the **MEN**
WOMEN and
CHILDREN of
NEW YORK
STATE

BE PREPARED
for the huffs
and puffs of
OLD KING

Now is the time to start building resistance against this winter's cold winds. And you can build a double defense against colds by including fresh milk in your daily menu.

Milk gives you two benefits against colds. It aids the alkaline reserve and is a primary source of Vitamin A, the anti-infective vitamin. Vitamin A helps you build resistance to respiratory troubles and will be stored by your system. Thus today's glass of milk will be of benefit months from now.

THE STATE OF NEW YORK

THIS is one advertisement of the 1939 campaign that is helping to increase the fluid milk consumption in New York State. Dozens of advertisements like this will appear in over 600 daily and weekly newspapers of the State. The campaign also includes the use of radio, posters, booklets and other publicity material.

(THIS ADVERTISEMENT is published to inform the public of the collective effort by which New York's great dairy industry is helping to promote greater consumption of its product through advertising.)

Kernels, Screenings and Chaff

By H. E. BABCOCK.

DURING the last presidential campaign a few of us were invited to join Governor Alf Landon on his train and visit with him about agricultural problems.

As I recall it, we got on the Governor's train in Albany, along with several hundred more or less rabid Republicans of both sexes. All of these patriots felt that they must see the Governor and shake his hand and it was an hour or so before the small party I was with was ushered into Governor Landon's private car.

By that time the Governor, who was near the end of his campaign, was simply reeling from fatigue. As we sat down with him I said to him, "Governor, it's a shame for a man to have to take such a beating."

He replied with a wry smile, "Well, I asked for it."

They Asked For It

The Governor's reply has popped up in my memory several times lately as I have heard from supervisors and members of the Legislature in New York State who right now are taking a terrific beating from constituents because of the threatened increase in real estate taxes in their state.

I feel sorry for you boys and I wish there was something which might be done to alleviate your problems. The records show, however, that "you asked for it."

Not So Serious

Perhaps it may help if you will adopt the philosophy of my friend Jim McConnell. When I told him how some of the appropriation makers were worrying, he remarked, "The boys shouldn't get excited. Just tell them to start voting 'no' on everything. I will bet that if they do the world will still be running a year from now."

Now, while Jim's advice isn't very scientific, it's comprehensive

and very much to the point.

There's no question but that the breaking point so far as real estate taxes here in the Northeast are concerned has been reached. Farmers simply cannot permit an increase in these taxes because their farms won't carry them. Under these circumstances, there's just one thing that can be done. It is for the members of county and state legislative bodies to start voting "no."

Not a Partisan Question

As is always the case in such situations, the political parties are trying to maneuver each other into unfavorable positions before what is now a tax-conscious people. I don't blame the politicians for doing this, but I would point out that our present high taxes are not necessarily the product of any one political party. They are the outgrowth of: (1) a sloppy and sentimental attitude on the part of the taxpaying public in general, and (2) the success of pressure groups selling programs calling for public expenditure to a gullible president, a gullible Congress, gullible governors and state legislatures, gullible county governments and gullible you and me.

The Only Remedy

The only thing that can be done to end the spending spree we have all been more or less enjoying is to set our foot down and stop spending! The place for the farmers in New York to set their foot down is in regard to further increases in our real estate taxes. The place to start voting "no" on appropriations is in county boards of supervisors, state legislatures, and Congress. *If enough "no's" are voted in these honorable bodies this winter, the taxpayers won't have to vote so many in the next elections.*

Electric Fence Advice

The following good advice about the construction and use of electric fences is contributed by M. S. Baker of Churchville, N. Y. Space does not permit printing his entire letter:

"With the electric fence, barbed wire—while disagreeable to handle—has the advantage of better visibility. This is especially true around the farmyard

and along the road where strange animals and careless motorists might drive through it before they see it. 14-gauge smooth wire is pleasant to handle but "kinks" badly while unrolling, due to lack of stiffness or "body." Barbed wire is somewhat difficult for a man working alone to stretch tight. Best way to put it up is by stretching from corner to corner. Then go back and fasten it to your line posts. By having

(Above): Another Doodlebug. This particular one is made from an old Dodge. It belongs to Frank B. Smith of Castleton, N. Y. According to my informant, Ed Mitchell, Mr. Smith's men use it for everything except washing dishes.

Lawrence Howard's bobtailed Doodlebug, (above). He calls it a chore boy. The picture shows it hooked to a cyclone duster.

(Above): The equipment of G. B. Richards & Sons, Old Acres, Perry, for cutting and loading in one operation green hay for grass ensilage. The thought occurs to me from our experience at Sunnygables that Mr. Richards might eliminate the man from the load by fitting the trailer with low sides.

(Below): The load of green hay dumped and the rack being pulled out from under the load. Mr. Richards says, "The boy in the white shirt is about to step onto the 8'x14' rack which is overbalanced at the back. He will walk forward and his weight with the man on in front will drop and latch the front end again and out they will go for another load."

every other one of your line posts staggered out of line, the wire will be uniformly well stretched.

"Avoid long, narrow laneways, as a mean horse or cow may crowd another animal into the wire and through. Remember that it is practically impossible to stretch electric fence tight enough

to constitute an effective mechanical barrier to untrained animals. In the spring of the year, when pasture season starts, is an excellent time to train animals. They will graze up to the fence slowly and get a full shock, due to the moisture in the ground and grass at this time."

Protective SERVICE BUREAU

AMERICAN
AGRICULTURIST
PROTECTIVE SERVICE

Conducted by H. L. COSLINE

Neglected to Explain

"Last August a young fellow came here selling subscriptions. He told me he was trying to earn a scholarship and had to have a certain number of subscriptions by six o'clock. I told him I would help him. I gave him a dollar and got the receipt. I did not receive the paper, and now I am told that I have to send another dollar to the publisher."

Willfully or otherwise this agent neglected to explain his proposition. The receipt that our subscriber received plainly states that it is necessary to send another dollar to the company. There is no way to force the company to send the magazine without sending the other dollar. This emphasizes the importance of reading every contract or order and understanding it thoroughly.

There's a "Catch"

"I am considering buying a life insurance policy, but the offer made seems too good to be true. The company says they have no agents and require no physical examination."

The company referred to is not licensed to sell insurance in the state of New York, but the law does allow them to do business by mail. Most of the policies sold by companies requiring no physical examination have a clause stating that if the insured dies from a disease that he had when he was insured, the company does not have to settle. We feel that it is wise to deal only with life insurance companies licensed by the State Insurance Department of the state in which you reside.

Agent's Promise

"A young man has been in this section selling aluminum kitchen utensils. Not everyone has \$50 these days to put into kitchen kettles, but this salesman got a few to sign orders by saying that he would not turn them into the company, but would be back in two months to see if they wanted to take them. He did not leave his address or that of the company and I am afraid that he will turn in the orders. If we did not accept the merchandise when the postman brings it can the company force us to pay?"

From a strictly legal point of view the answer is emphatically "yes" because most agreements of this sort have a clause stating that the company is not bound by verbal promises of the agent. However, we have often found that while companies will attempt to persuade you through threatening letters they do not commonly sue to collect where merchandise is refused under these conditions. A good many subscribers have found that it is unwise to go on the promises of agents that they will not turn in orders until they have permission from the customers.

Advance Fees

A fraud order has been issued against the Hoosier Mailing Service of Mishawaka, Indiana. This concern advertised for individuals to address and mail postcards, and promised to pay a commission on sales resulting from the postcards which advertised cosmetics. The ear mark of unreliable home work firms is the request for advance fees.

"What can you tell me about Thorison of Manitowoc, Wisconsin?"

Mr. Thorison sells watches, radios, toilet articles, electric shavers, etc., on the mail order plan. His advertising asks for a dollar as a deposit on certain supplies. We are informed that these supplies consisted of a number of catalogs, listing the merchandise and prices at which Thorison is selling the articles. Those who send one dollar

get the catalog and are instructed to mail catalogs to those who might want to buy, and IF these result in orders, the individual is promised a commission.

Cressy Gets Prison Term

In the past we have made several comments about W. J. Cressy of Milwaukee, Wisconsin, who at various times was connected with the Associated Adjusters, Flying Intelligence Service, International Airway Bureau and other schemes. January 9th Mr. Cressy was sentenced to five years in federal penitentiary on each of eight counts charging use of the mails to defraud. That sentence, of course, will not result in a return of money to those who lost it. The surest way of breaking up fraudulent schemes of all sorts is for the public to refuse to do business with them.

About Stamps and Coins

The Service Bureau is receiving an increasing number of letters making inquiry about stamp and coin buyers. The majority of such concerns require the buying of a catalogue before they will do business with you. The charge has been made that the sale of catalogues constitutes their principal source of income. We always like to present both sides of a case. It seems evident to us that it would be difficult for concerns to appraise stamps and coins without some income from it. We say this because the market value of stamps and coins depends upon their scarcity, and therefore, it follows that a majority of those sent in for appraisal would not have any more than face value. Reliable coin and stamp companies will buy valuable coins and stamps, but much advertising appears to be misleading in that it does not fully describe the coins and stamps. It is evident that many who read the ads believe they have what the company wants, only to find that it does not quite meet the specifications.

Plea for Help Brings Many Answers

In the February 18 issue we ran a letter from a young man eligible for parole from Auburn Prison who wants to work on a farm. Up to date 101 kind-hearted people have written replies to this letter and more are coming in every day.

Obviously it will take him some time to acknowledge all of these letters, but we have asked him to do so.

We are very hopeful that, from the many letters received, the boy will get his job and a chance to make good.

\$25.00 Weekly Benefit

Specified Sickness and Accidents

Men and women accepted — ages 15-69 at \$10.00 a year. No medical examinations. Policy pays on specified sickness and accidents. Write for full details.

North American Accident Insurance Co.
Savings Bank Building, Ithaca, N. Y.

This is the wrecked car in which the Rupert family was injured.

Gentlemen:

In behalf of myself and family I wish to gratefully acknowledge the prompt service rendered us following an accident which happened to us on Dec. 27, 1938.

Our car was badly demolished due to skidding on an icy road and striking a culvert, while we miraculously escaped with our lives. Only about a month previous we had all taken out policies with your agent, J. N. Hughes, and can assure you, and the public in general, that assistance at such a time is mighty convenient.

Myself and children have practically recovered, but Mrs. Rupert is still suffering from injuries.

Again thanking you, I am

Sincerely

Fred Rupert

FEED FROM THE **HAY** MOW

IS CHEAPER THAN

FEED FROM THE **BAG**

GOOD HAY provides digestible feed at just about half the cost of purchased concentrates. Many a dairyman has found that by raising more and better hay he can cut his grain feeding down as low as one pound to every five pounds of milk produced.

In considering ways and means of increasing the quantity and quality of hay, the first thought naturally must be given to the seed.

There are 260,000 seeds in a pound of red clover. Seeding at the rate of 15 pounds per acre would give 90 plants per square foot, if every seed made a plant. Fifteen plants per square foot is considered a perfect stand. A lighter seeding of better seed will do the job more economically than heavy seeding with ill-adapted seed.

Seeding rates shown on this page are based on the use of seed that meets these specifications:

1. **Seed that inherits the ability to produce a crop.** G.L.F. seed is selected from regions where the winters are as severe as they are here, and from fields that have produced big yields year after year.

2. **Seed that is clean.** It takes elaborate equipment to remove weed seeds and foreign matter. G.L.F. has this equipment, and the men who know how to operate it. Every lot of G.L.F. seed is checked for purity and germination at the State Seed Laboratory before shipment.
3. **Seed that will grow.** The hard coat that protects hardy clover and alfalfa seed keeps soil moisture out. Such seed germinates very slowly—it may not sprout until next year, maybe never. The G.L.F. Kem-Fee process thins down the seed coat, lets moisture in so the seed can sprout quickly. It gets ahead of the weeds, gives cleaner, thicker stands.

A few cents extra per acre for inoculant will increase the yield, and add valuable nitrogen to the soil for the use of future crops.

The second thought must be given to fertilization. While the basis of hay fertilization is manure, superphosphate added to the manure or spread directly on the field will in most cases increase the yield way out of proportion to its cost.

SUGGESTED MEADOW RATES OF SEEDING

Alfalfa, alone 12-15 6

Alfalfa (on wheat or with spring grain) 15-20 7½

Sweet Clover 15-20 7½

*Where the practice of aftermath grazing is to be followed, seed the red clover, alsike clover and timothy mixture and in addition two pounds of either Ladino white clover or yellow trefoil. G.L.F. Dairymen's Red Clover and G.L.F. Dairymen's Alsike are recommended for this purpose.

In this Corner

DO YOU KNOW BEANS? If you do, you may recognize these as Bountiful green snap dwarf, one of the best of the early beans. It will be months before beans fresh from the garden appear on the tables of G.L.F. patrons—many weeks before the seed even goes into the ground. But this is the time of year when many farm women—and men too—are planning their gardens. So this picture is printed as a reminder that G.L.F. Service Agencies carry a complete line of vegetable seed, in small and large packages, of the familiar and reliable G.L.F. Quality.

★ ★ ★

ARE YOU A HITCH-HIKER? Professor Whiton Powell of Cornell admits he is. He tells about it in the forthcoming issue of the *G.L.F. Patron*, and incidentally raises some pertinent questions that G.L.F. patron-members may have to decide. In another feature article, Lucile Brewer tells how to have shortcake 365 days a year. The printer who set the type on that one complained that he couldn't make any progress—too many people looking over his shoulder.

★ ★ ★

EGGS GO TRAVELING. The New York Central Railroad is now supplying all its dining cars out of Buffalo with G.L.F. eggs from the Buffalo egg marketing unit. This is one of the

new outlets recently opened up by G.L.F. marketing men, who are constantly seeking—and finding—new channels for the distribution of eggs and produce from patrons' farms.

Producers Fight for A LIVING PRICE for MILK

By H. L. COSLINE

DAIRYMEN, faced with the certainty of a collapse in milk prices following the court decisions by Judges Francis Bergan and Frank Cooper which we reported in our last issue, promptly and courageously rolled up their sleeves and went to work to prevent chaos in the Buffalo and New York City milk markets. Organized dairymen served notice that New York City dealers who failed to sign contracts containing the essential provisions of the Federal-State Milk Marketing Order by midnight of March 4 would get no milk Sunday morning. Many dealers, including the larger ones, signed; but some small dealers, handling about 25 per cent of New York City's milk, refused to do so.

Dairymen diverted about half a million quarts of milk to manufacturing plants, and as dealers began to feel the pinch of short supplies they began, one by one, to put their names on the dotted line. At this date (March 11) dealers handling over 80 per cent of the milk going into New York City have signed and organization leaders are decidedly optimistic that another 10 per cent will sign before the deadline on March 14. Dealers who signed did so with the provision that contracts would not be binding unless dealers handling 90 per cent of the milk had signed by that date.

The situation in the Buffalo market has quieted down, and everything appears to be running smoothly. Producers and distributors met in separate groups to discuss the matter of contracts. Then each group named a committee to meet together to agree upon a milk price and to thresh out other details of the contracts. Most of the leading milk dealers in the Buffalo area have expressed themselves as sold on the equalization plan as the most stabilizing influence the market has ever had.

From a legal angle all that can be done is being done. Assemblyman Howard Allen of Dutchess County and Senator Joseph Nunan of Queens County have introduced bills into the

State Legislature designed to amend the Rogers-Allen Law to meet the objections raised in Judge Bergan's recent decision. The proposed amendment contains a provision stating that "equalization shall include milk of all grades and produced by all breeds of cows, and may include milk produced by a dealer."

In the meantime steps are being taken to get a United States Supreme Court decision on the constitutionality of the Federal-State Milk Marketing Agreement for New York as quickly as possible. However, it is agreed that it will take at least a month and probably more to get that decision. Dairymen who believe that the Supreme Court will reverse

Judge Cooper's decision received some moral support from a recent decision of the United States Supreme Court. The decision reversed a former ruling of the Supreme Court of Pennsylvania by sustaining the constitutionality of the Pennsylvania law requiring milk dealers to obtain licenses, to pay minimum prices, and to file bonds to insure payment to producers. Federal-State milk marketing agreements are now in effect in about 25 markets and to date the New York decision is the only one that has been adverse.

Dairymen are fighting for a living price for milk. If a group of small milk dealers is successful in its frantic efforts to prevent voluntary attempts of the industry, including both producers and some dealers, to keep some order in the New York City milk market, there

is no question but that milk prices will hit the toboggan. Considerable jubilation has already been expressed by the anti-farm gang, led by a farm paper publisher, over the court decisions which declared portions of the Rogers-Allen Law and the Federal-State Milk Marketing Agreement unconstitutional. If, in spite of the dogged efforts by producers to keep the situation under control, milk prices do go into a tailspin, the anti-farm gang will have further cause to rejoice.

The group of dealers who have refused to sign contracts are leaving no stone unturned to attain their ends. Their agents, meeting with producers, are using the same old arguments which, through constant use for twenty years or more, are getting rather dog-eared and moth-eaten.

First among the arguments is that attempts to get 90 per cent of the dealers handling milk to sign contracts are certain to fail. "Therefore", they say, "you had better get a market for your milk while the getting is good. If you don't you may be left out in the cold and have to take butter and cheese prices."

If dairymen will stick together, they will ALL get a living price for (Turn to Page 10)

Cooperation Will Win!

IN THE many attempts to solve the milk marketing problems of past years, I have never seen dairymen so united and so determined and yet so calm as they have been in the New York milk shed since the milk orders were declared unconstitutional. Nor have I ever seen the organization machinery of farmers working so well. Both groups in and out of the Bargaining Agency, and both organized and independent dairymen have been working shoulder to shoulder.

It has not been a milk strike, but simply a diversion of milk by farmers from the dealers who have not been willing to cooperate. I think a word of commendation is due to the large number of better class dealers who signed so promptly the contracts with dairymen, to carry out voluntarily the spirit and the principles of the milk order. Of course, controlling the chiseler and stabilizing the market is just as much the dealers' responsibility as it is the farmers'.

As a result of good organization and cooperation all the way along the line, it looks now as if the dairymen and the constructive dealers at this writing would win in the present plan to keep the market stabilized. But there is still some milk going to dealers who refuse to sign.

With the principles of the milk order continued in operation, dairymen can be assured of the best price which the market offers, but it is well to remember that the milk market itself is in not too good shape this spring. There is a large amount of milk available, and consumption is still curtailed on account of hard times in the city.

"20% FUEL SAVING plus more tractor power"

says Lester Pfister, of
El Paso, Illinois, who
has grown \$1,000,000
worth of hybrid seed corn

This is one of the three high compression Oliver 70's which do the work on the Pfister Hybrid Corn Company's 480 acres of black land northwest of El Paso, Illinois

LESTER PFISTER started raising hybrid seed corn as a hobby. Today the Pfister Company is one of the country's largest dealers in hybrid corn... raises inbreds for more than 140 growers. A recent article in a farm magazine says that Mr. Pfister has sold more than \$1,000,000 worth of hybrid seed corn. Within the past two years Mr. Pfister has discarded low compression tractors for modern high compression Oliver 70's.

Here's what he says:

"I never realized before the fuel economy and power a high compression tractor has over the old low compression jobs. I am using 2-bottom, 16-inch high speed plows; do all my plowing in third gear—about 4.33 miles per hour.

"I know that my fuel saving is at least 20% and as I am doing the same work (and pulling the same tools) with my Oliver 70's that I formerly did with my 3-bottom (low compression) tractors, I am satisfied that high compression is also giving me 20% more power. Of course, I am using regular-grade gasoline.

"I feel that high compression has

done a lot in helping the farmer do his work more cheaply and quickly."

You can do more work faster and save on fuel with high compression. Here's all you have to do to change over most tractors to high compression:

1. Install "altitude" pistons or a high compression cylinder head.
2. Change the manifold setting or the manifold to the "cold" gasoline type and use "cold" type spark plugs.
3. Use regular grade gasoline (containing tetraethyl lead).

And when you buy your next tractor be sure the engine is designed to operate most efficiently on regular grade gasoline (containing tetraethyl lead). This means one or more of such features as: high compression cylinder head or pistons, "cold" gasoline type manifold, or an "automobile" type engine.

By Romeyn Berry

LONG WEEKS may lie ahead of us before spring really comes. On the other hand, it isn't winter anymore. That, I suspect, is the special significance of March.

When I look directly out the window from which I view the changing seasons, it's a pretty discouraging picture that presents itself. Out in the garden there has just come to light a hoe that got itself lost last fall. It should have been taken in, but it wasn't. The wilted squash vines must have hidden it where it fell, and then the yellow leaves covered it and finally the endless months of snow. Now it lies there in the unpleasant nakedness of March to charge us with being slovenly farmers.

Beyond the hoe, and in the orchard, a forgotten apple crate, with one slat partially ripped off and sticking up, presents further evidence to sustain the indictment. And still farther on past the orchard, I can see yet another field toward which we meant well, goodness knows, but which had gotten itself no more than half plowed when the winter sprang upon us without warning that short, dark December afternoon, and put a stop to all further cultivation of the soil. It's a March picture of shabby grays and depressing browns, designed to impress it upon us that we have left undone those things which we ought to have done and there is no health in us.

But I've only to lean forward over my desk and turn my head a matter of sixty degrees to see another phase of this mercurial month—a happier phase that shows the world, while not awake, at least stirring in its sleep and the work of our hands about to bear fruit. For by stretching ever so slightly, I can see the dark, rich chocolate of fall-plowed fields and headlands, the brush of former hedgerows neatly piled for burning, and on beyond the North Lot already glistening with the tender green of winter wheat.

Straight ahead the picture is as I said, a depressing one. But I've only to stretch and turn my head to view another scene that voices the certain coming of the spring in the earnest of the wheat. In such a situation he must be very much in love with peevishness who prefers to look straight before him and refuses to turn enough to see the promise in his North Lot.

It sounds courageous to say you're facing facts and looking straight ahead, but when you're doing that, you're missing most of the view. Too many farmers are looking straight ahead, I suspect, and then only at the ground before their feet.

How do I know the spring is coming up? I don't, but it always has. How do I know that farm conditions will improve? I don't, but they always have. My goodness gracious! To hear folks talk—even the leaders and teachers who ought to know better—you'd think we never had hard times before. Have they never heard of the peace in Europe after the Napoleonic wars which killed our export market overnight and left American farmers flat? Have they never heard of the panic of 1837 which started people turning their

wheat into whisky because they could not hold it and it didn't pay to haul it?

Things were pretty bad up our road in the late 1850's, but inside of five years wheat went to \$2.30 and farm hands paid cash for trotting horses and courting buggies. What about Kansas in more recent times when the grasshoppers descended on them one year and eastern creditors the next, and it's still a toss-up as to which did the most damage?

The other day a buyer came around and offered us seven cents for our best corn-fed hogs. We said we'd rather eat them ourselves even though it might take us years. But all the time, it was back in our minds that if some fool tossed a match in the powder mill which is Europe, those pigs might fetch fifteen cents on the hoof inside of two months, and come August that green fuzz in the North Lot might be \$2.00 wheat.

No right-thinking person wants to have prices put up that way, but it would be no more miraculous to have it happen then to see those naked, twisted trees in the orchard loaded down with apple blossoms by mid-May.

It would be pleasanter and more wholesome, of course, to see prices go up because part of the money now clogging the banks because people are afraid of what might happen in Europe, Asia, and Congress, got put to work again and city folks once more took to eating all the milk, butter, eggs, potatoes, fruit, and garden truck they really wanted. That happening would be no more miraculous than the departure of the dirty snow along the fences and the appearance of the first mess of cowslip greens, two important events to which I look forward with reasonable assurance.

The circus business hasn't been any too good, either, in recent years, but there will be circuses just as long as people keep on having babies. It's babies that make the circus business a sound one. And the farm business is a sound one, in spite of its ups and downs, because so many people have the eating habit. There'll be farms, and some pretty prosperous ones, too, as long as folks get hungry three times a day; and I'm just as sure that city folks will keep on getting hungry three times a day as I am that the picture I see from my window will change a lot in the next two months; that the hoarse crows of March will give way to the warblers and the orioles of May and before you know it I won't be able to see anything much on account of the apple blossoms.

Far be it from me to attempt to cover the hard facts of present-day farm conditions with nice-sounding words or with apple blossoms either, but I still think the spring is coming up because it always has; that farm conditions, being low, are going to get better because they always have.

We're going right ahead pretty soon to plow and drag and fertilize and spray and plant just because we don't know anything else to do with a farm; and because some day, we believe, the farm will pay us back. It always has!

CHARLES M. GARDNER

Editor of the National Grange
Monthly and High Priest of De-
meter of the National Grange.

NEW YORK STATE leads all the others in the volume of business turned in to the National Grange Mutual Liability Company at Keene, N. H. The company has several New York offices, with headquarters at Syracuse, where the president of the company, former State Master Fred J. Freestone, is located, the other offices in the Empire State being under his direct supervision. The close of the company's year December 31st showed a surplus for the benefit of policyholders of almost \$425,000, with heavy cash reserves and a total of more than \$2,000,000 in dividends and premium discount savings for policyholders, during the 16 years the company has been in operation.

FOLLOWING THE SUCCESS of the state-wide singing contests in New York State, a similar project is getting under way in New Hampshire and during four big regional meetings which are to cover the state during the month of May a contest of quartets will arouse lots of interest, starting with elimination events in each Pomona district and leading up to state finals.

A RHODE ISLAND Grange event of more than usual interest is scheduled for Tuesday evening, April 25, at the Rumford Grange hall, when Providence County Pomona will celebrate its golden jubilee anniversary. The event will take the form of a general banquet, with quite elaborate speaking and entertainment program, followed by a social hour, dancing and merry time. Providence County Pomona has a large and enthusiastic membership and carries on many worth-while activities, especially providing leadership for community improvement projects within its jurisdiction.

ROSE HILL Grange, No. 116, Waterloo, Seneca County, N. Y., celebrated its 65th anniversary February 25. The Grange history was read and a roll call of Past Masters and Lecturers was read. Harold Stanley, State Lecturer, was present and spoke, and a pageant showing the Grange history was presented.

AN INTERESTING PROJECT is calling forth much Grange interest in Susquehanna County, Pennsylvania, where about one-half the 26 subordinate Granges have entered into the project of Grange Hall kitchen improvement. Under competent leadership many of the kitchens have been completely overhauled, conveniences added and labor-saving arrangements introduced. The cost runs from \$50 to

\$200, much of the labor being donated by members and a scoring plan has been worked out which introduces a competitive spirit in the project. So far Lenox and Fairdale Grange halls have scored the highest, following a ten-month competition. The State Grange Home Economics committee in Pennsylvania is backing the movement, which is likely to extend the coming year into several other counties.

FORMER STATE MASTER Fred J. Freestone of New York recently made quite a reputation for himself as an installing officer of Granges in the vicinity of the National Capital. During a week's attendance at a meeting of the National Grange executive committee (of which he is chairman) at Washington, Mr. Freestone installed the officers of Pioneer and Great Falls

Granges in Virginia, and of Potomac Grange, No. 1, at Washington. The master of the latter group is A. M. Loomis, former assistant in the National Grange Legislative Office at Washington and well known to Patrons in New York State, which at one time was his residence.

BETHLEHEM Grange, No. 137, Albany County, N. Y., will celebrate its 65th anniversary on March 25. The County Deputy will make his official visit, and the First and Second Degrees will be exemplified.

DECIDED HONOR has come to the Granges of Connecticut through the fact that former State Master Frank H. Peet, who is this year a member of the Lower House in the State Legislature, has been named as chairman of

the committee on agriculture. Mr. Peet is one of the successful dairy farmers of Connecticut, very alert and progressive in his methods, and during the past season was designated as one of the Master Farmers of his state.

AS A MEANS of creating Juvenile Grange interest in Rhode Island a plan has been worked out for a song contest this season, which is expected to enlist the efforts of many of the Grange youngsters. The competition is to include the composing of words, which may be set to any tune the writer selects. Assistance to the children is being given by the sociological department of the State College at Kingston, headed by Prof. W. J. Tudor, who is keenly interested in the Juvenile branch of Grange work.

THE *Editorial* PAGE

BY E. R. EASTMAN

Address all mail for Editorial or Advertising departments to American Agriculturist, Savings Bank Building, Ithaca, New York.

Taxpayers Are Mad

I AM THOROUGHLY mad, with an anger that has been growing within me for years until it has reached the violent, boiling stage. So, if you don't want to hear some facts straight from the shoulder, better stop here.

Last July Mrs. Eastman and I sold a house in Yonkers, Westchester County, which was our home before we moved to Ithaca five years ago. Most of the time since we moved, the house has stood vacant, due to the hard times, while we paid interest on a mortgage and taxes in just about the worst county and city in the United States from a tax standpoint. The house was finally sold at great loss, wiping out savings of years.

When I came to make out my State income tax report a few days ago, I found that had there been any profit in the sale of the house it would have been taxable, but NOT A CENT OF THE LOSS WAS DEDUCTIBLE.

The next day after making my tax report, I had lunch with a group of Buffalo business men engaged in the flour and grain trade. They had come together for a conference to find some way of protesting against the proposed special tax of 2/10 of 1 per cent on all business turn-over in the State. They pointed out, and rightly, that should this tax bill pass the New York State Legislature, it would mean \$500,000 increase in their taxes on feed and flour manufacturing and handling and would compel them either to close shop or move out of the State. In either case farmers eventually would pay this additional turn-over tax not only on feed products but on most of the other things which farmers buy.

After the Buffalo folks had gone, I looked over our own tax payments on *American Agriculturist* in recent years, and came to the sad conclusion that this publication, together with most other small businesses of America, will be out of business within five years unless some way can be found to put a stop to increasing taxation.

On the same day I picked up a newspaper and read that the politicians in Washington are now considering raising the legal debt limit from \$45,000,000,000 to \$50,000,000,000. Just a few days ago I read of that splendid army of taxpayers, 8,000 strong, representing 350 citizens' organizations of the State, who marched on Albany to demand a cut in the State budget. At the same time, the only people who objected to a cut in State budget and taxes were an organized group of city employees who demanded that instead of cutting the budget more taxes should be raised. That made me just about the maddest of all, for it emphasizes the fact again that government officials and employees are always crowding up their salaries, even if the business men and farmers of the country who pay these taxes are headed straight toward ruin. In fairness it should be added that citizens themselves are often the worst offenders by demanding more and more government services.

Also, some of us are tired of all these schemes for social security, old age pensions, job insurance, etc. Some employees may wake up when it is too late and realize that a job right now is better than some vague promise of an income or security twenty years from now.

What I am trying to say is that it is time to give us a chance to catch up by calling a halt even to good public enterprises, to say nothing of the billions of public money that are unnecessarily wasted, particularly recently, in so-called emergency projects.

But there is one bright spot in the "lengthening

shadow of government" in taxation, and that is that the tax-ridden common citizen is at last waking up. We have stood all we can, and we are serving notice that if those in authority won't take steps to reduce public expenses, we, the people, will show them how, and it won't be pleasant.

Supreme Court Condemns Labor Board

DON'T fail to read the strong language of Chief Justice Hughes of the United States Supreme Court, reported on our Slants page this time, in rendering the recent decision of the Court against sit-down strikes and some of the activities of the United States Labor Relations Board.

This decision by the highest court in the land justifies everything *American Agriculturist* has said regarding sit-down strikes. We have said repeatedly that they were illegal and un-American. Particularly is the Supreme Court decision interesting because of its severe condemnation of the Labor Board for its unfair and partisan support of labor.

Now the next step is for Congress to amend the Wagner Labor Act so that neither radical labor nor the Labor Relations Board can have any further excuse for trying to hamstring both agriculture and business.

Go Slowly With the School Bill

ATTENTION is called to the article on Page 23 in this issue, explaining the Bill now before the New York State Legislature, which provides for laying out the remaining common school districts of the State in central school districts. This does not mean, of course, that central schools are to be built immediately in all these districts. Its purpose, as we understand it, is to provide an organized plan so that when more central schools are built they will be of the right size and in the right places.

We of *American Agriculturist* believe that central schools, of which there are now over 250 in the State, are in the main a good thing. Undoubtedly in the rapid growth of these fine schools there have been mistakes, and in some

cases probably some extravagance, but they do give country boys and girls an equal educational opportunity with village and city children. It is comparatively easy for young people on the farm to get at least a high school education now, something which was not the case when I was a farm boy.

It is interesting also that most of those who originally opposed the central schools, particularly parents with children, now are enthusiastically for them.

Nevertheless, the bill in its present form is too arbitrary, does not contain enough local control safeguards, and therefore needs amendment, and it should not be passed until country people have had full opportunity to understand it and to suggest amendments.

Prizes for the Best Homespun Contest

IN PLACE of the wornout vaudeville performances of former years in front of the grandstand at the New York State Fair, this year there will be such contests as a greased pig race, a tug of war between the 4-H boys and girls and the Future Farmers of America, a wood chopping contest, and an exhibition of sheep-herding dogs.

The Fair management is very desirous of organizing more of these homespun contests and exhibitions, and will pay \$25 for any and every suggestion that any readers of *American Agriculturist* can offer of which the Fair can make use. Prizes will not be paid, of course, for any suggestion which the Fair is already planning to put into use, or if some other reader beats you to it with the same suggestion.

Address your letter, with your suggestion, to *American Agriculturist*, Department S, Ithaca, New York.

For many years we have been suggesting through this publication that a larger use of this homespun idea would make any Fair more interesting. Horseshoe pitching, which we have conducted for 15 years at the Fair in cooperation with the Farm Bureau of the State, is an example. The Grange Singing Contest, conducted by the Grange, is another.

These contests start early in the season back in the farm communities and come to a grand climax at the State Fair itself. What the Fair needs now are more ways of carrying out the homespun idea. So get your thinking caps on and let's hear from you.

Eastman's Chestnut

I SHOWED the following chestnut, sent in by an A. A. reader, to a friend and he said:

"Well, New England folks would get a laugh out of that story, but I don't know whether New Yorkers will or not."

Anyway, here it is:

"Touring through New Hampshire in the early days of automobiling, we found ourselves confronted with a signboard on which was the name of the town toward which we felt sure we were headed, but the arrow on the board pointed back toward the town which we had left a half hour before. Much confused, we waited until a man approached driving his old nag leisurely. He allowed that he was one of the selectmen, and could he help us? We remarked concerning our problem. His reply was: 'Oh, you're going all right. We got that sign up on the wrong side of the road, but we didn't bother to change it because we thought everybody'd know.'"

A SITDOWN LET DOWN

Four UNFORGETTABLE Weeks

Plan Now to See Europe This Summer with American Agriculturist Folks

enjoy the many pleasant things which make up ship life — deck sports, dancing, visiting, ship concerts, cards, movies, walking on deck, sitting comfortably in a deck chair with a good book; and, last but not least, enjoying the good meals which are a feature of Canadian Pacific ship life. Besides three meals a day, there will be hot soup served on deck and in the lounges in mid-morning, and tea in the afternoon.

AUG. 4 — SCOTLAND. We land in Glasgow, Scotland, on the morning of Aug. 4, and we feel almost as much joy in seeing land again as Columbus felt when he sighted America. We say goodbye to our ship, which has seemed like home for several days, and then we are off to the *Lady of the Lake* country. By rail, small steamer and coach, we visit Lock Lomond, Inversnaid, Stronachlachar, Lock Katrine. We see stark, gloomy mountains and lovely, sparkling lakes, and of course "Ellen's Isle" and the majestic Trossachs.

AUG. 5 — EDINBURGH. From the Trossachs, we go to quaint Callander, and then by rail to Edinburgh, perhaps the most beautiful and interesting city in the world. There we will see famous Princes Street, John Knox's house, Holyroodhouse, King's Park, the

Abbey, the House of Commons, House of Lords, Westminster Hall, Whitehall where Charles I was beheaded, Buckingham Palace and the colorful "changing of the guard" ceremony, the Thames River, Lambeth Bridge, and other interesting sights. That night we will cross the English Channel to Holland.

AUG. 10 — HOLLAND. We will motor through Holland, that land of windmills, dikes, cheese, wooden shoes, quaint costumes, and bicycles! We'll visit the Hague, Leyden, Haarlem, Amsterdam, Volendam, take a steamer across the Zuyder Zee to the Isle of Marken, visit Monnikendam, and return to Scheveningen for the night.

AUG. 11 — BRUSSELS. From Holland we travel by train to Belgium, the brave little land that sacrificed itself to hold back the German Army at the beginning of the World War. In Brussels there will be an afternoon of sightseeing, including the Bourse, Grand Place, Hotel de Ville, King's Palace, the ancient guild houses, the famous Manneken Fountain, Palace of Justice, and other public monuments.

AUG. 12 — GERMANY. From Brussels we travel southward by train to Cologne, city of towers and turrets. There we will visit the magnificent Gothic

One of the show places which American Agriculturist folks will see in Stratford-upon-Avon: This centuries-old house was the home of John Harvard (1607-1638), who immigrated to America and became the founder of Harvard University. Besides this interesting house, our party will visit Shakespeare's home, which seems as solid today as it was three hundred years ago.

THERE is something about taking a trip, seeing new sights, and meeting new friends that does one a world of good. The change acts as a tonic to body and soul; the bright memories we carry home remain with us to add color to the years ahead. And when it's a trip to more than half a dozen different countries in Europe, we take back not only memories but a better insight into current events abroad and a clearer picture of lands where history was made before America was ever heard of, even old songs and stories become more alive to us after seeing the very places mentioned in them. As you read the itinerary of our trip, think how many stirring events, how many old tales these names call up.

The entire cost of our trip is reasonable beyond belief — \$497.50. This covers all expenses from Montreal to Europe and back again, including even tips, taxes, and visas. An experienced escort will take entire charge of the party and relieve us of all details of getting from place to place. We will visit seven European countries, Scotland, England, Holland, Belgium, Germany, Switzerland, and France — each so different from the other that it will seem like visiting seven different worlds. If you are interested in taking this wonderful trip, fill out the blank at the end of this article, and mail it to E. R. Eastman, Editor, *American Agriculturist*, Ithaca, N. Y. You will receive a printed itinerary, with full information about the tour. In the meantime, here are further details of where we will go:

JULY 28 — MONTREAL. Board the S.S. *Duchess of Richmond* at 10 a. m. Eastern Standard Time, and sail down the majestic St. Lawrence River to historic Quebec.

JULY 29-AUGUST 4. For two days after leaving Quebec, we are in sight of land on both sides of the St. Lawrence, with only four days on the open sea. Time flies by as we all get acquainted with each other and

Burg Maus, one of the many romantic medieval castles that crown hills of terraced vineyards on the Rhine.

University, Cannongate where ancient houses speak of past centuries, and Edinburgh Castle with its memories of Mary, Queen of Scots.

AUG. 6 — ENGLISH LAKE COUNTRY. Leaving Scotland, we go down into Merrie England, traveling by motor coach which permits us to see the beautiful English countryside and to stop where we please. We'll see Galashiels, Selkirk, Gretna Green, Carlisle, Keswick, and wind through the lovely English Lake District whose beauty has been sung by the poet Wordsworth. On our route will be Chester which dates back to Roman days and still has well-preserved Roman walls.

AUG. 7 — STRATFORD-UPON-AVON. Continuing our motor trip, we will see the famed castles of Warwick and Kenilworth, will visit Shakespeare's home in Stratford-upon-Avon, Ann Hathaway's Cottage at Shottery, and other famous places in that region. This will be another memorable day to treasure all our lives.

AUG. 8 — OXFORD. From the Shakespeare Country we motor to Oxford, where we will see one of England's great universities. Then on to London town, with a stop on the way at Windsor Castle, one of the most impressive historical monuments in England.

AUG. 9 — LONDON. There's a marvelous thrill when one arrives in this great metropolis where so many famous scenes in history have been enacted. We will have a full day of sight-seeing here, traveling in comfortable buses, and will see beautiful Westminster

cathedral, one of the finest in the world. From Cologne we go to Coblenz.

AUG. 13 — RIVER RHINE. This day will be one of the highest "high spots" of our trip, for we will have an enchanting voyage of several hours over the most romantic part of the Rhine River, passing ancient castles, medieval fortresses, Boppard, St. Goar, Assmannshausen, etc.; on to Bingen, and thence by rail to Heidelberg.

AUG. 14 — HEIDELBERG-LUCERNE. In Heidelberg, there will be a morning program of city sightseeing including the University with its Karzer (Student Prison), the Altstadt, the Ritter, the quaint old Town Hall, etc. Then to Lucerne by afternoon train.

AUG. 15 — GRAND ALPINE TOUR. Until you have seen Switzerland, you cannot realize what a fairyland it is with its opalescent lakes, white capped mountains whose peaks pierce the blue sky; gleaming glaciers, Swiss chalets; robust, red-cheeked natives; goats and cows grazing on steep mountainsides; Alpine flowers, lake steamers filled with gay tourist crowds; and towns that seem like gardens with their carefully pruned trees and frequent flower boxes.

Our route by motor coach takes us through spectacular mountain passes and valleys, along the Lake of Lucerne, via the famous Axen- (Turn to Page 23)

A fascinating Old World scene: The River Rhine and the city of Cologne, seen from an open-air restaurant along the water front. On Aug. 12, our party will visit this lovely spot.

It costs Less to Own and Operate a Coburn one-wire fence Controller

*Safety
Approved by
Wisconsin Industrial
Commission*

... and it's backed by a 5 Year Service Guarantee

Made by the oldest established electric fence company, Coburn Controllers operate with the greatest economy and dependability on either high line, battery, or farm plant models.

Coburn Controllers provide exclusive engineering advantages that lower your fencing costs.

And you'll find these attractive, efficient controllers are equipped with every important practical convenience feature that saves time and steps in operating a fence line.

6 YEARS PROVEN SERVICE

You can always rely on any Coburn unit to do every fencing job at all times. Many Coburn Controllers—used by leading farmers everywhere—are now in their sixth year of satisfactory, trouble-free service.

Write today for colorful, free Coburn booklet that explains and shows how and why these popular priced controllers with a 5 year service guarantee operate to give you more fence for your money.

Important Engineering Features that make the farmers boost their Coburn Controller to friends and neighbors

At left above is the fool-proof Coburn high line Synchrocyclic Timer—automatically timed by the cycle of the alternating current. There is nothing to get out of order.

At left, below, is the Coburn Electrolytic Capacitor used on battery models. It has only one moving part—uses less battery current than other fencers having equal power.

EASIER on the feet— TOUGHER on the job!

It's hard to believe that such comfortable shoes can be TOUGH enough to stand up under the most grueling work in all weather. Try them and see! And SAVE MONEY too.. for their rugged leather construction makes them last longer. There's a Sundial Dress Shoe too, for every member of your family.

For the name of your nearest dealer write Sundial, 21 Hudson St., New York City.

SUNDIAL WORK SHOES

NEW YORK BRANCH INTERNATIONAL SHOE CO., INC.

—Photo by U. S. Forest Service.

LIKE CHAFF BEFORE THE WIND.—Better than any words could describe it, this graphically pictures the enormous task facing many New England farmers, to clear up the enormous damage created by the hurricane early last fall. In addition to government payments being made for timber cut and hauled to yards or ponds, an agricultural conservation payment of \$4 an acre up to 15 acres per farm is available to farmers who clean up trash to eliminate fire dangers.

Measure Logs Accurately

THE INTERNATIONAL log rule is the fairest and most accurate device to measure the board feet of square-edged lumber that can be sawed from a quantity of logs, according to Earl D. Strait, chief appraiser of the Springfield Land Bank. He advocates the International rule instead of the Doyle rule, especially for small logs. The International has been adopted by the Government as official for scaling timber being salvaged in the hurricane area of New England.

Giving figures to back up his assertion, Strait said: "An 8-inch log, 16 feet long scales 16 board feet by the Doyle rule, whereas the International rule gives 40 feet. And 40 is right. For an average 12-inch log 16 feet long, the Doyle rule gives 64 board feet, where the International gives 95.

"In two recent tests where the International rule was used to measure logs, one lot which scaled 63,000 board feet by the International rule sawed out 63,346 board feet. Another lot which scaled 12,000 feet sawed out 12,140."

When first originated in 1900, the

International rule allowed for a 1/8-inch saw kerf. In 1917 it was revised for a 1/4-inch kerf to conform with common milling practices throughout the Northeast. Since then, according to Strait, the International rule has proved consistently accurate, particularly for second growth timber when well milled.

Since 1922 the Federal Land Bank has provided its appraisers with a special set of timber measuring sticks, including a cruising stick to give the volume of board feet and the cords of wood in standing trees, and a scaling stick based on the International log rule to measure the board feet of lumber in logs. Nearly 4000 complete outfits of the cruising and scale sticks have been put in use, and in addition, 2500 of the log sticks have been requested by timber buyers since the hurricane last September. As a matter of educational service to farmers of the Northeast, the sticks are available at cost plus postage. The complete outfit, including cruising stick, scaling stick and instruction book, is available for \$1 postpaid, or 35c for the scaling stick alone.—L. P. Ham.

Woodlot Owners Cooperate

By J. S. KNAPP

TIoga COUNTY, in southern New York, has the first private, non-subsidized cooperative that is prepared to handle all products of the farm woodlot, such as firewood, pulpwood, lumber, and mine props. The first sale contract has just been announced, for 100,000 board feet of saw logs, bought by the Cotton-Hanlon company of Cayuta, New York. After deducting administrative expenses, and allowing an extra five per cent for sound forestry practices, the owners will receive substantially more than they would get as individual sellers.

Incorporated as the Tioga Woodland Owners Cooperative, the group has a membership of fifty at the present time. They own and control 3,000 acres of merchantable timber. Co-operating and aiding in the project is the Extension Service of the New York State College of Agriculture, through the forestry department and Prof. J. A. Cope, extension forester.

The entire area which may be included has 100,000 acres and is rectangular

in shape, with corners at Waverly, Owego, Spencer, and Candor. About 30,000 acres are wooded, and nearly 25,000 acres contain merchantable timber. Ownership of the woods is divided among 800 individuals.

A survey was started in 1936 by the Federal Forest Service, aided by the Soil Conservation Service and the Tioga County Farm Bureau. A complete inventory of all standing timber was made in August, 1936. "Never before in history," says Cope, "has there been a hundred per cent inventory made of 25,000 acres of farm woodlands."

In Cope's opinion, similar set-ups are possible in other parts of the state, and country, where the right conditions exist. The first requirement is that the woodland cooperative be near wood-using industries that can purchase and process all forest products grown by woodlot owners.

Second, enough merchantable timber must be in the area; and finally, growers and mill owners must have the cooperative attitude.

Parade of NEW PERENNIALS

By GRACE WATKINS HUCKETT

(Above): Perennial Aster, Harrington's Perfected Pink, is truly pink in color and a fine fall flower.—Photo courtesy, Dreer. (Above, left): Korean Chrysanthemum Lavender Lady, flowers October 8th, height 2½ ft., and is a lovely silver lavender tint when mature. Photo, courtesy, Bristol Nurseries, Inc.

TWO RECENT outstanding contributions to the columbine family are the handsome red and white Crim-son Star and the extremely long spurred yellow Longissima. I had both of these in my garden last summer and took an unholy delight because I had grown them from seed. My next adventure with columbine will be among the new clematis-flowering ones. Good mixtures of long-spurred hybrids are the Mrs. Scott Elliott and Dobbie Imperial strains.

Another outstanding development among perennials is the strain of Pacific Giant Hybrid delphiniums with flowers of amazing size, tightly set on strong whippy stems. Plants are 60-65 per cent mildew resistant and flowers will not scatter. Colors range through the various shades of blue and lavender, some with white and some with dark bees. I was more than satisfied with the plants which I grew from seed of that strain. This season a pure white Galahad, with white bee is introduced for the first time. A new true pink delphinium, Sensation, is another of the year's novelties.

A new Korean chrysanthemum illustrated here is Lavender Lady which, as its introducer says, is an entirely new and needed garden chrysanthemum color. It is a clean, attractive flower assuming a lovely silver lavender tint when mature. It is in full flower October 8th, height 2½ ft. Other new chrysanthemum varieties are Pale Moon, with fluffy sulphur yellow double blossoms, in full flower October 5th, height 2 ft.; Burgundy, a large cerise crimson, quite double, flowers October 5th, height 2½ ft.; Rose Glow, a distinct raspberry rose color, blossom semi-double, flowers Oct. 5th, height 18" to 24"; Roberta Copeland, bright tomato red color, semi-double, flowers Sept. 15, height 1½ ft.

New hardy asters, more dwarf in form and

colors much improved, are meeting the real need for fall blooming flowers. Beechwood Challenger is a red, 4 ft. tall, September-flowering novelty. Harrington's Perfected Pink is the first true pink variety developed. My experience with Aster Frikarti, Wonder of Staefa, was most satisfactory. It grows about 2½ ft. high and has lavender blue flowers from 2 to 2½ inches across and blossoms from June 1 to the middle of September—quite a record for any flower.

The new double Shasta daisies lend quite a bit of interest to the garden.

Gallardia comes now in pure yellow or entirely red tones. The yellow ones

are Sun God, Mr. Sherbrook and Golden Goddess. The reds are Ruby and Burgundy. The combination red and yellow flowers appear in larger forms than ever. The great advantage in some of the newer types is that the stems are erect rather than lumpy.

The early spring flowering coreopsis in its characteristic bright yellow now may be had in double forms or sweet-scented.

Doronicum (Leopard's bane), a yellow daisy-like flower, is among the first to bloom and is a distinct addition to the garden. It is best to plant it in fall or after its early blooming season is past. Some low growing varieties, 18" or so, are suitable for rock gardens whereas the taller ones may be as much as 3 ft. tall.

Speaking of rock garden plants, arabis or rock cress now appears in varied colors in addition to the old familiar white. Spring Charm is a red form, Alpina Rosea a pink. The purple rock cress, Aubretia, has leaves very similar to the other forms with flowers in varying purplish tones, according to variety. Hardy Candy-tuft (Iberis) may now be had in colors, the original form being

(Continued on Page 9)

(Right): Pacific Giant hybrid delphiniums are increasing in popularity as they become better known. Colors vary from dark blue, through the pastel shades to pure white.—Photo, courtesy of Vetterle & Reinelt.

CHILEAN NITRATE is the only natural nitrate. It is guaranteed 16% nitrogen. And it also contains, in natural blend, small quantities of other plant food elements.

Many of these elements such as iodine, boron, calcium, zinc, copper, iron, manganese and magnesium, in addition to phosphorus, nitrogen and potassium, are necessary to plant life for normal good health, growth, quality and yield.

Therefore, Natural Chilean Nitrate is agriculturally valuable both as a source of nitrate nitrogen, and to furnish, or build up a reserve of other plant food elements naturally blended with it.

Use Natural Chilean Nitrate—take advantage of its quick-acting nitrogen and its many protective elements. It is well-suited to your crops, your soil and your climate.

Plant protectors may be made with square sheets of blanch- ed waxed Kraft paper, using two metal cones as shown.

More About FROST PROTECTION

By PAUL WORK

IN THE last issue I promised to say more about definite means of protecting early crops from frost. In the West and South, some use is made of orchard heaters for frost protection. These are effective simply by heating

Paul Work

up the air of the orchard and that is a pretty large order. Expensive equipment and a store of oil or other combustion material are required. The method has not been used very much for vegetables.

Perhaps, more commonly used than any other methods of warding off frost, are various kinds of plant protectors. Actually tomato

plants are sometimes protected by simply hoeing a bit of earth from one side, tilting the plant over and covering it with soil. This is rather drastic but if carefully done and if the cold spell does not last too long, may save a crop that would otherwise be lost.

As much ingenuity has been expended upon inventing various kinds of frost protectors as in any phase of agriculture. One market gardener has wire frames about the size and shape of a 14-quart pail which are covered with muslin. These are made during the winter and serve for a good many years. Their commercial production would probably be too expensive to be practical. Others make use of peach baskets. Of course, in emergency, gardeners will use burlap bags, newspapers—anything to save plants on a frosty night.

Perhaps, the most important of the commercial devices for protection are the little paper houses which go under the name of Hotkaps. These are made of translucent waxed paper with an extra band of paper to stiffen them. They are rather low but are very well adapted for muskmelons and other cucurbits. Also, they serve nicely for sweet corn, lettuce and other crops but they are hardly tall enough to be really satisfactory for tomatoes. The same company now gets out Hotents in two sizes which allow more room.

Much research in the use of plant

protectors is needed. Indications from practice are that one can sow seed or set plants about 2 or 3 weeks earlier with paper protectors than otherwise. Where light is admitted, we have two effects: one is protection against frost and the other is the growth promoting effect that we have in greenhouses. Some plant protectors that are on the market do not admit light and are valuable for frost protection but not for growth promotion.

In the use of plant protectors, certain precautions ought to be observed. As soon as plants attain any considerable size, the paper protectors ought to be cut to provide ventilation. Increase the opening as the season advances so that the plant will be well hardened before the covers are entirely removed. This ventilation is necessary not only to harden plants but to forestall too moist an atmosphere which may favor the development of disease.

Another satisfactory form of protector for home gardens, used to some extent commercially, consists in setting wire arches in the ground similar to croquet arches. Then, bleached waxed kraft paper or parchment paper is unrolled over these arches and the edges are held down with earth. I have had good success with these, planting hills of early sweet corn about 2 feet apart and sowing beans between the hills.

This is only a fraction of the story of frost protection. Quite a little literature is available on the subject. A most-fascinating hobby it is to study weather and climate habits and plant habits and to weave the two together to see what we can do to outwit old Jack Frost.

"I'd be satisfied if Stonewall would just turn over, let alone turn over a new leaf."

New Perennials

(Continued from Page 7)

white. It is evergreen and therefore very desirable.

Hardy carnations come in unbelievably beautiful colors in single and double forms and are easily grown from seed. The new forms of dianthus or garden pink, have equally beautiful colors. Some members of this family are erect growing, while others are excellent creeping plants suitable for the rock garden. While you are considering plants of this kind, don't overlook Sweet Wivelsfield, a cross between the garden pink and Sweet William, another old garden favorite now appearing in beautiful colors. Newport pink is a particularly lovely salmon pink. Helianthemum or sun rose, is another rock plant easily grown from seed which come according to variety or in mixtures of colors. The foliage is evergreen almost, the little flowers like tiny single roses which stay open until mid-afternoon, then close tightly.

A new creeping form of baby's breath, Gypsophila repens bodgeri, has double flowers which open pink and fade white as they grow older.

The primulas, especially the polyanthus types, are perfectly fascinating and new colors are constantly being developed. Primulas like light shade; a slightly damp, rich loam freely mixed with leafmold and peat, is ideal. While we are on the subject of low growing plants, veronica, either pink or blue, yields a beautiful mat. Of course other forms of veronica are both medium and tall growing. Another low growing plant of great daintiness is Coral Bells, Heuchera. The newer form, Sanguinea, is bright red and lower growing than the older pink variety. The rosette of leaves of this plant is interesting throughout the year.

The great family of campanulas provides a large variety of plant forms from the creeping carpatia and turbinata to the familiar tall cup-and-saucer. The Canterbury Bells are really biennial, whereas some of the smaller forms are hardy perennials.

Another biennial, digitalis or fox-glove, comes in the most amazing new shades, far removed from the old muddy looking colors.

The new oriental poppies are a far cry from the old Chinese red form. The dark red Beauty of Livermore, the orange apricot Mrs. Perry and Perry's white are varieties which I have found very satisfactory. A new variety called Snow Flame has the lower two-thirds pure white and the upper third flame red.

September blooming plants are always in demand. The tall Liatris, Blazing Star or Gayfeather, is a showy, tall spiky plant easily grown in this country. A new Liatris, September Glory, has a 6 ft. spike solidly covered with purple flowers which have the desirable habit of blooming all at the same time.

The new hardy phlox and painted daisies (pyrethrums) are far ahead of the old varieties.

"That road was especially designed to give work to as many men as possible."

Attention—FORDSON Owners!

MARCH IS THE MONTH TO CHECK OVER YOUR TRACTOR FOR COMING SPRING WORK!

CUT OUT this handy check-list, and make it a point to give your Fordson a thorough spring go-over. A tractor overhaul now will let you get to work as soon as conditions permit—produce more efficient operation when you get out into the fields—guard against delays when you are busiest.

Your Fordson dealer will be glad to help you with your spring check-up. He can supply Genuine Fordson Tractor Parts for repairs and replacements. If you haven't a dealer nearby—write for advice or parts to the address below.

CHECK THESE 7 POINTS ON YOUR FORDSON!

- ☐ 1. **Ignition**—check spark-plugs, magneto, wires.
- ☐ 2. **Compression**—remove carbon, look for loose rings, worn pistons and valves, leaky head gaskets.
- ☐ 3. **Radiator**—and all connections.
- ☐ 4. **Steering gear.**
- ☐ 5. **Spindle bushings and pins, wheel bearings.**
- ☐ 6. **Transmission and rear axle.**
- ☐ 7. **Fuel system**—fuel line, tank valves, carburetor.

STEWART SHEARMASTER

DOES A QUICK, SLICK JOB

Get 10% more wool from same sheep or goats with the fast, easy-to-use Shearmaster. Powerful ball-bearing, fan-cooled motor inside the special EASY-GRIP handle—diameter barely 2 inches. Designed for farm flock shearing. New professional type tension control. Removes fleece from sheep in a few minutes. No second cuts. Longer fibre wool grades better—brings more money. Saves time—work. Pays for itself quickly in extra wool secured. Shearmaster, complete with 2 combs and 4 cutters, only \$22.95 at your dealer's or send us \$2.00. Pay balance on arrival. Slightly higher west of Denver. Write for new Stewart bulletin, "Harvesting the Farm Flock Wool Crop," and FREE catalog of Stewart electric and hand-power Clipping and Shearing machines. Made and guaranteed by Chicago Flexible Shaft Co., 5664 Roosevelt Road, Chicago, Ill. 50 Years Making Quality Products.

Producers Fight for a Living Price for Milk

(Continued from Page 1)

milk. If they allow dealers to discourage them, a small group at a time, EVERY DAIRYMAN will take less money.

The second argument is expressed in terms of dollars. "Break your contract with your cooperative. Sign now with us and we will pay a premium for your milk," say the dealers' agents. That's old stuff. Most producers know (and every producer should know) that the small dealer handles very little surplus milk. By paying a few cents more than the blended price, but a lot less than the Class 1 price, that dealer is able to cut prices in New York City. Thinking dairymen will not accept a few cents more, temporarily, when they understand that it means dollars less, eventually.

The third argument is that the dairy organization leaders are crooks who are interested only in holding their soft jobs. That, too, is old stuff. For the most part, producers have elected dairymen from their own groups to head dairy organizations, and these leaders are working night and day in their fight for a living price for milk.

There are several interesting sidelights on developments in the last two weeks. The first is that, in general, diversion of milk has been accomplished with far less violence than has occurred in similar situations in the past. Dairymen are not engaged in a milk strike. They are merely refusing to sell milk to dealers who refuse to play fair with them. There was one attempt to blockade a plant at Bullville, Orange County, which failed when a delegation of deputies and state police convoyed four milk trucks to the plant.

Commissioner Noyes took the occasion to state that it is the job of organized dairymen to see that all violence is avoided.

In reply Homer Rolfe, President of the Producers' Bargaining Agency, in a telegram to the Commissioner, said: "The Agency has not and does not recommend or condone violence. If there is violence, it will only be because some dealers have gone beyond the patience of the farmers in breaking down an honest effort on the part of farmers to work out the problem jointly, cooperatively, and constructively."

A very pertinent instance happened in Onondaga County. The Bargaining Agency, the Dairymen's League, and a number of individuals were served with injunctions preventing them from influencing relations between a dealer and the Lafayette Milk Producers' Association. Dairymen themselves decided the issue. Said they: "It is our milk, and we can do with it what we wish." They diverted it.

Never before have organized dairymen rallied around a plan with such unity. The Federal-State Milk Marketing Order was written through cooperation of agents of the federal government, the State Department of Agriculture, and dairy organizations. At that time the hope was expressed that ultimately dairymen, through organization, could handle the situation without government help. The opportunity and challenge came sooner than was expected. Dairymen accepted it and went to work.

Wool Outlook Brighter

In 1937 New York State sheepmen sheared 2,518,000 lbs. from 327,000 sheep, and averaged 36c a pound. In 1938 the number dropped to 320,000 from which 2,304,000 lbs. was sheared and the average price received was 20c.

The outlook for the coming season is brighter than it was a year ago. Stocks of wool on hand January 1 were smaller than a year ago, and it is expected that wool consumption for the first three months of this year will be heavier than a year ago.

Dr. Naylor's MEDICATED Teat Dilators

Safe and dependable treatment for
Spider Teat, Scab Teats, Cut and
Bruised Teats, Obstructions.

Dr. Naylor Dilators are sterilized, medicated and saturated with the antiseptic ointment in which they are packed. They have a deep yielding surface of soft absorbent texture which fits either large or small teats without overstretching or tearing and which carries the medication INTO teat canal to seat of trouble.

The Only Soft Surface Dilators

Whether infection at end of teat, cut or bruised, the resulting condition which closes teat canal making it hard to milk is always the same—INFLAMMATION.

To relieve inflammation in a wound or bruise the treatment most universally used by the veterinary and medical profession is—to apply antiseptics, healing agents and a sterilized, soft absorbent dressing.

Dr. Naylor's Medicated Teat Dilators apply this same treatment for removing inflammation from the milk canal of cows' teats. They carry antiseptics and healing agents into teat canal to combat infection and promote healing.

The dilators themselves are sterilized, soft, absorbent dressings which protect the inflamed area, absorb inflammatory exudates and keep teat canal open in its natural shape while tissues heal.

Sterilized, Medicated—
Packed in Antiseptic Ointment
Large Pkg. (48 Dilators) \$1.00
Trial Pkg. (18 Dilators) .50

DOWN THE Alley

By J. F. (DOC) ROBERTS

I AM STILL of the opinion that a great many heifers now held on farms in the Northeast for milk purposes could be, and should be, fattened up with some of this cheap grain and feed and sold for beef this spring before grass time. The reason I say "before grass time" is because they will make better meat if not turned out on grass, and therefore will not compete with southern grass cattle and will probably bring more off dry feed than they will after turning onto grass, unless of course they are very thin.

Figures seem to bear out this heifer situation—in the Northeast alone on January 1, 1939, they show almost 100,000 more heifers that have not yet come in to milk than on January 1, 1937. The tough part is that every other section of the country also shows an increase, for a total of over 500,000 head.

Livestock on feed this year is gaining better and doing better, with less death loss, than in most any year I can remember. Now I read that milk production per cow this winter is averaging better, in fact the highest since 1929. The reason I am mentioning this again is because I cannot see why, last year, animals should have done so universally well, and this year so universally well, particularly since the same conditions existed all over this country both years.

Horses are the only class of livestock which shows a decrease this year over last—so you colt men are still in a relatively strong position, although horses so far this spring are selling lower than a year ago.

Sheep show an increase of over 1 million head, or about 2%; hogs, about 4 million head, or 1%; cattle, about 700,000 head, or 1%; and chickens about 7%. Some of my good chicken friends tell me that baby chicks have gone onto farms so far this year, here in the Northeast, in such greatly increased numbers that some of these men are estimating it as high as a 30% and 40% increase. Maybe this next year there will be "a chicken in every pot."

Sad news to northeastern cattle men—President Roosevelt has signed a proclamation allocating to Canada 51,720 head of the 60,000 foreign import cattle quota for the next three months, beginning April 1. A great many cattle in the last 60,000 quota, which began Jan. 1 and which is now filled, came in from Mexico and our situation in the Northeast was not greatly harmed, but this is different.

Have been wondering lately whether the expense and the experience would be greater in buying and breaking a colt, or in buying and constructing a "Doodlebug"; anyway one is a hay-burner (you can depend upon that), while the other is a gas and oil burner, if and when you can get it repaired and started.

"I see your cousin Willie's back from the market."

How to promote FRESHENING with SAFETY

The lion's share of all dairy cow ailments and productive lapses have their origin at Freshening time. Not because the producing of a calf is in itself a threat to health. It is solely because the organs on which the burden comes have been weakened by month after month of unnatural stress in converting dry, rich grains into maximum milk yields. Digestion and the generative functions, when hard-driven for milk, are in no shape to take on the added strain of calving without a consistent build-up of stamina.

This is why thousands of dairymen give KOW-KARE with the feed to every cow due to freshen, for a few weeks before and after her danger month. Even if you are one of those who have not yet discovered the profit that lies in REGULAR winter conditioning with Kow-Kare, you will readily realize that freshening time is no time to take chances. Don't forget that ailments and off-feed conditions are not sudden occurrences, but steal stealthily in for weeks or months with little outward sign. Kow-Kare is a formula of Iron, Iodine and medicinal herbs and roots that build up the blood, digestion and assimilation, promoting a capacity to meet extra strains without hazard to health.

And it costs so little

As an insurance feature alone, every freshening cow should have the Kow-Kare aid. It costs no more than 1¢ to 2¢ a day to follow the Kow-Kare directions for medicinal aid at calving. Try it for one season and your record of vigorous cows and healthy calves will leave no room for doubt. General stores, feed dealers and druggists have Kow-Kare. By mail: \$1.25 large size, 65¢ medium size, including postage.

FREE COW BOOK—Valuable 32-page illustrated treatise with chapters on common cow ailments. Tells how to home-mix 17 different feed formulas of proven worth. Send for your copy today.

NORTHEASTERN *Slants* ON THE *National* NEWS

■ *New Deal to Play Ball With Business*

THREE high-up government officials have indicated that business is about to get a much-needed break. Speaking recently in Des Moines, Iowa, Secretary of Commerce Harry Hopkins promised wholesale government co-operation, saying: "It is our determination to make every move we know how to promote recovery and get people back to work on private jobs." Touching on several sore spots, he said that he was against any general tax increase; that peace has now been made between utilities and government and time has come for private investment in that industry; that labor needs to be more tolerant and fair in reaching agreements with employers. Regarding New Deal remedies for agriculture, he admitted they were no cure-alls. "No simple or final solution," he said, "has been found."

Secretary of Treasury Morgenthau has also declared himself against new taxes and in favor of a Congressional study of present tax system in order to find out what taxes are holding back business.

Words of encouragement for business came earlier from President Roosevelt. Before setting out on his cruise last month, he said that business has nothing to fear at present from Administration goals, promised that there would be no further expansion of Federal power projects; and that country need fear no higher taxes.

On all sides it is being predicted that this new government attitude, plus Supreme Court rebuke to National Labor Relations Board and sit-down strikes, plus natural forces already working for recovery will make this year a more profitable one for everybody.

Commenting editorially on Administration's change of heart toward business, a recent issue of "Business Week" points out that it has become a matter of "political life or death" for New Deal to get business on its feet again. "The New Dealers," it says, "realize to the full that the main reason for their defeats at the polls last fall must have been the low level of business activity and employment, combining with a reaction against political radicalism."

■ *Sit-Down Strikes Outlawed*

IN PLAIN-SPOKEN language, United States Supreme Court has handed down three decisions rebuking National Labor Relations Board for condoning sit-down strikes and for ignoring employers' rights.

In majority opinion by Chief Justice Hughes, Court denied Board the right to compel reinstatement of sit-down strikers in Fansteel Metallurgical Corporation's plant, denounced the strike, and condemned Board for exceeding its authority. Calling Fansteel strike a "high-handed proceeding without shadow of legal right," the Chief Justice said:

"To justify such conduct because of the existence of a labor dispute or of

an unfair labor practice would be to put a premium on resort to force instead of legal remedies, and to subvert the principles of law and order which lie at the foundations of society."

The other two cases in which decisions were rendered involved Sands Manufacturing Company of Cleveland, Ohio, and Columbian Enameling and Stamping Company of Terre Haute, Indiana. In all three decisions, vote was 5 to 2, with Justices Black and Reed dissenting and Justice Frankfurter not voting. As result of the three decisions, it is now established:

1. That an employer can fire employees who commit illegal acts or engage in violence in any form.

2. That courts are open to employers who object to findings of fact on which Labor Board decisions are based.

3. That it is up to workers to express a desire to bargain with the employer, and not an employer responsibility to seek out workers with whom to bargain.

In decision involving Sands Manufacturing Company, Court rejected evidence on which Labor Board made its decision. Said Justice Roberts, who wrote the opinion: "We think the conclusion (reached by the Labor Board) has no support in the evidence and is contrary to the entire and uncontradicted evidence of record."

When Supreme Court decision against sit-downers was announced, a strike was in progress in plant of Bendix Corporation at South Bend, Indiana. Strike came to a sudden end when strikers heard that they could be discharged for their action.

SLANT: See editorial page.

■ *Less Taxes and More Self-Help*

SPEAKING to annual conference of New York State Grange lecturers in Syracuse recently, National Master Louis J. Taber called for economy and lower taxes by "cutting the frills and graft out of government."

"While every good citizen," said Mr. Taber, "must be willing and anxious to pay the necessary costs of government, taxation is at a danger point when, from school district to federal government, the tax gatherer takes almost one-quarter out of every dollar earned in the nation. It is not surprising that New York and many other states are facing a veritable tax rebellion. We must take the necessary steps to feed the hungry and protect the unfortunate, but we must not crucify the property owner in doing even these necessary and desirable things. We must broaden the base of taxation and give farms and homes special consideration."

Regarding government control and regimentation, Mr. Taber declared that farmers cannot rely on government to control all the problems of the present machine age, without building a bureaucracy that will destroy freedom and liberty. Solution of farm problems, he pointed out, must be sought in organization, self-help, a better understanding between individuals and groups, and in scientific research to develop new markets, new methods, and new uses for farm products.

Another clarion call for cutting government costs came from Washington early this month. Democratic Senator

Harrison of Mississippi, who has launched a drive to cut Federal expenses, pointed out in a formal statement published March 2 that by the first of July, 1940, the national debt will have reached the limit which the present law fixes for it—45 billion dollars. It is reported that Administration plans to ask Congress to raise limit from 45 to 50 billions. Senator Harrison and other senators have announced their opposition to this and, also, to increased taxes. They propose instead a conference of all government leaders to consider at least a 10 per cent cut in Federal expenses.

SLANT: A real campaign to cut government costs would do more to bring about a business revival than all the high-powered spending the government has ever done or can do.

■ *Senate Passes Army Bill*

BY VOTE of 77 to 8 last week, Senate passed army defense bill which provides for bringing number of Army planes up to 6,000, increasing number of Army air pilots, and strengthening Panama Canal fortifications. Bill now goes to conference with House, which acted previously on it but authorized only 5,500 planes.

Passage of bill followed five-day Senatorial debate on Administration's foreign policy. Defending policy in two-hour speech just before Army bill came to a vote, Senator Barkley said that it is designed to preserve peace. "I believe," he declared, "that by our foreign policy we are enjoying a greater degree of respect among the nations, not only in the Western Hemisphere but all over the world, with the possible exception of those who do not believe in our form of government, who do not believe in democracy, and who talk about congresses, parliaments and legislatures as assemblages of gabbling geese."

SLANT: Reasonable expenditures for national defense may be needed, but recent provocative speeches of some political leaders are not a part of our national defense. On the contrary, if continued, they will lead to war.

■ *Farmers and Industry Need Each Other*

SPEAKING at National Farm Institute, Des Moines, Charles R. Hook, chairman National Association of Manufacturers, said in part:

"We in industry cannot prosper unless you in agriculture prosper. Certainly that is one of the lessons all of us have learned. We know that the inter-relation of farm and factory is no mere catch phrase, is no mere theory, that it is a solid fact."

"If the farmer is broke and cannot buy, that means the wheels of industry are stalled. . . . But that is only one side of the picture. If industry is interested in the prosperity of agriculture, so is the farmer concerned with the welfare of industry. Industry is the farmer's biggest single customer. In all great markets that the farmer supplies, even counting the food requirements of millions of human stomachs, the farmer actually sells more of his agricultural products to industry than to any other market."

"This startling fact is of comparatively recent development. It is one of the as-

sociated miracles to the great miracle of industrial research. More and more has industry, in the process of its own development, widened the production vistas of the farm."

"Take the case of corn for example. Out of the 2,500,000,000 bushels that American farmers grow in an average year, over 40 per cent is fed to the hogs and another 52 per cent to cattle, horses, poultry, etc. In other words, 92 per cent of the corn is consumed on the farm. The remaining 200,000,000 bushels is consumed by millers of corn meal and flour, by the distillers of potable and industrial alcohols, and by the great corn refining companies that turn this farm commodity into a bewildering array of products."

"The farmer's corn is likely to appear in Fourth of July fireworks, in paints, colors, adhesives, paper, textiles, chewing gum, cough syrup, leather, infants' food, soft drinks, ice cream, candy and scores of other things."

"What industry is doing with soy beans is a thrilling story itself, while the conversion of raw milk into fountain pens, billiard balls, airplane propellers, telephone parts and a hundred other plastics almost staggers the imagination."

"The point is that the factories of modern American industry are calling more and more upon the farmer for raw materials, and as industry grows and prospers so does the farmer. One great chemical company alone uses the products from 4,000,000 acres of American farm land. One large automobile company requires the entire cotton crop of 186,000 cotton farmers. And so it goes."

■ *Farmers Against Chain Store Tax*

RESOLUTIONS condemning proposed anti-chain store legislation were recently passed by three New York State farm organizations—New York State Horticultural Society, Empire State Potato Club, and New York State Vegetable Growers' Association. Adoption of these resolutions was in line with action by National Grange, American Farm Bureau Federation, and National Cooperative Council at their annual conventions. All united in condemning Patman Bill which proposes a ruinous tax on chain stores.

The Empire State Potato Club of Rochester, in condemning the measure, declared that such legislation would tax chain stores out of existence and would "seriously hinder the distribution of all farm products, and result in higher costs to consumers and lower returns to the producer." The Club went on record as opposed to "all punitive and discriminatory legislation, either state or national, that will tend to reduce our income or add to consumers' food costs, by taxing any system of food distribution."

Officials of numerous other farm organizations are taking up the cudgels for chain stores. L. H. Hiscock, of Skaneateles, N. Y., vice-president of International Baby Chick Ass'n., has commended chain store surplus campaigns, citing last year's egg drive as a "life saver for the industry." George A. Jeffreys of Calcium, president of N. Y. State Turkey Growers Ass'n., has stated that he believes that the chains are doing good work moving surpluses, and that they have helped to solve marketing problems by improving quality, grading and promotional sales."

■ *Surplus Food Plan Being Drafted*

A NEW "stamp" system of distributing surplus food products to persons on relief is under consideration by U. S. Department of Agriculture and is an outgrowth of "two-price" plan talked of some time ago. Under new plan, two types of stamps, one blue and one orange, acceptable at retail grocery stores and redeemable by government,

would be distributed to persons eligible to receive aid.

The orange stamps would replace cash spent for food out of work-relief wages or direct relief allowances. They would be redeemable for any product of internal consumption except drugs, liquor and candy. The blue stamps would be worth 25 cents each and would be issued to relief families to enable them to buy 50 per cent more food than they can now afford. For example, a family now spending \$16 a month for food would get \$16 worth of orange stamps, plus \$8 worth of blue stamps—the blue stamps, however, to be redeemable only in products periodically designated as “surplus” by Department of Agriculture.

It is reported that officials of U. S. Department of Agriculture hope that plan will be operating on experimental basis in six large cities by middle of next month. Idea is mainly to move surpluses, and is expected to bolster consumption of milk, butter, cream, eggs, meat, fruits and green vegetables—all foods on which low-income families economize when money is scarce and which therefore pile up surpluses in hard times.

About 22½ million persons (includes all members of families of 7,146,000 persons now receiving public aid) will be in line for food stamps when they are ready for distribution.

■ Revolution Within a Revolution

EVENTS took a new turn in Spain last week when an anti-Communist national defense council overthrew regime of Premier Negrin and took into its hands destinies of what is left of Loyalist Spain. Premier Negrin, who up to time of his overthrow had considered further resistance to victorious Rebel Commander General Franco, fled to France.

New council is trying to bring Spain's civil war to speedy end by negotiating an honorable peace with General Franco, whose powerful armies are ready to attack Madrid and Valencia if Loyalists' resistance is continued. Two conditions which Council is demanding in return for surrendering Madrid are: Safe conduct for Loyalist leaders to Spain's borders, and guarantees that no Italian troops will be permitted to march triumphantly into Madrid as they did after fall of Barcelona.

New Council's efforts to handle situation are being hampered by counter revolt by Communists against its leadership. Result, as we go to press, is a bitter “family fight” within Madrid, while outside the besieged city the armies of the Rebel enemies watch and wait.

■ “Food Lockers” Increasing

IDEA of having “food lockers” in connection with community ice plants seems to be spreading. Latest news of them is that down in North and South Carolina, during watermelon season, many families keep a string of melons down at ice plant until they get ready to eat them.

Out West, food lockers are said to lower meat prices to those who use them. While some vegetables and fruits are stored in them, they serve mainly for cold storage and freezing of meat. Many plants furnish services in butchering, chilling and aging of meat, along with such other packing house operations as curing, smoking, rendering of lard, and grinding.

At normal prices and yields from live beef, it is reported that cost of

average run of beef cuts is about 15c a pound to the food locker patron as compared with an average price of 26c a pound retail.

SLANT: We predict that this new form of refrigeration is going to do much to bring back the self-subsisting type of farming, and thereby better and happier living conditions.

Good Books to Read

MARIS, by Grace Livingston Hill. Another fine character portrayal from the pen of this author, whose romances are so well known, a story of a gallant and devoted family.—J. B. Lippincott Company, Philadelphia. \$2.00.

ARMAGEDDON, Eleanor V. Schuyler DeForest. One of our American Agriculturist readers, Mrs. Richard D. DeForest of Amsterdam, after 14 years of invalidism caused by arthritis, has just published this novel. During her years in bed Mrs. DeForest has found her most absorbing study in Biblical prophecy, and she conceived the idea of using the theme in a story. The story moves from the peace of the California mountains to the mad

whirl of events surrounding the overthrow of the Antichrist. The climax is reached in the battle of Armageddon and the return of Christ to earth on Christmas Day, this time not as a babe but as a conquering King of Kings. The book sells for \$1.00, and is published by the Wm. B. Eerdmans Publishing Co., Grand Rapids, Michigan.

Good Movies to See

STAGECOACH. Nine strangely assorted passengers on a stagecoach bound for a dramatic journey through barren desert land and gorged rivers, living in constant fear of an Apache uprising. Thrilling, glorified Western, making up a suspense-filled, heart-breaking, and at times humorous story.

DARK RAPTURE. Working with permission of the Belgian Government, an expedition penetrates the Belgian Congo and returns with photographic records from hitherto unexplored sections of the jungle. This film introduces to the world a tribe of pygmies, the capture and training of wild elephants, and a race of giants giving striking evidence of an ancient civilization.

Let These Tillage Tools PROVE THEIR VALUE

● Judge McCormick-Deering Tillage Tools on their performance. Let them *prove their value*. Then we'll leave it to you to say whether your fields aren't in better shape for seeding and planting after these machines have done their work.

For 1939 the International Harvester dealer in your community is offering the best line of tillage tools ever sold under the McCormick-Deering name. Every change and every new feature will help you get your crops started right.

See what this line offers that can benefit you. You'll find here the most up-to-date disk harrows, peg and spring-tooth harrows, soil pulverizers, rotary hoes, field cultivators, rod weeders, land packers, harrow-plows, and tractor cultivators for every operation.

INTERNATIONAL HARVESTER COMPANY
 (INCORPORATED)
 180 North Michigan Avenue Chicago, Illinois

Top: A good tillage job . . . McCormick-Deering Disk Harrow and Peg-Tooth Harrow working behind a Farmall 20 Tractor.

Above: An ideal tillage tool for most farms . . . the McCormick-Deering Spring-Tooth Harrow. A Farmall 14 is furnishing the power.

Left: Close-up of the strong, heat-treated disks that make McCormick-Deering Disk Harrows leaders in their field. All disks in these disk harrows have the famous crimped center. This strengthens the disk and makes possible a close, snug fit. Other features: long life and a good, lasting cutting edge.

McCORMICK-DEERING

TILLAGE TOOLS

By L. B. SKEFFINGTON

From SKEFF'S NOTEBOOK

APPARENTLY Editor Ed's several recent editorials on marketing of apples have aroused interest. Several growers have spoken to me on the subject. For some time I have tried to garner all angles of the subject and form some idea of what should be done and how it should be done.

It seems to me the needs of the apple industry make it necessary:

1—To produce a higher percentage of good quality fruit;

2—To handle it more carefully and pack it with more regard to how it will appear when offered for sale at retail.

3—More effectively to "merchandise" and "sell" this fruit to the trade and educate the trade in presenting it to the consuming public.

A Matter of Dollars and Cents

On the first point I want to present some figures obtained by Dr. F. A. Harper of Cornell University in a study of net prices received for apples on 54 Ulster County farms in 1937. Dr. Harper would be the last one to claim his figures are the last word. He is continuing his studies over a much wider area and, I am sure, is approaching the subject with an open mind and a judicial attitude. I am impressed by one remark he made recently in discussing net returns. "We may find the answer lies not entirely in marketing, but in farm management," he said. What he meant was that a higher percentage sold in the upper grades may be important.

"No. 1 grade McIntosh sold for 40 to 50 cents a bushel higher than Utility, Commercial and Unclassified fruit," he said. "Fancy grade averaged only 12 cents premium over No. 1. The only difference between Fancy and No. 1 grades is color. The fruit sold as Fancy may, however, have been better than No. 1 in features other than color. In that event, the 12 cents difference could not all be credited to color.

"Among grades other than official state grades, the highest price was paid for tree-run fruit. It sold even higher than Fancy. Apparently fruit sold tree-run was of excellent quality. Both drops and No. 2 Grade sold from 41 to 58 cents a bushel below No. 1. These differences indicate the advantages to growers who can produce fruit

of high quality. The premium for fruit of No. 1 grade, as compared with Commercial or Utility, probably exceeded the additional costs of production."

Apples in Ithaca

During Farm and Home Week, Leo A. Muckle, assistant county agent leader, asked if anything could be done to get good New York apples into local markets. In company with Tom O'Neill of the Apple Institute I visited a number of stores. We asked for New York State apples. Stores of one large chain said they had none. They had southern apples supplied from the district warehouse. Manager of one independent store said he had had some good apples from Seneca County some time earlier in the season. Our assumption was that he would do something about renewing his supply, rather than offering western apples, if the demand were insistent.

We went to another chain store and found the apples offered were bruised so badly that it was difficult to imagine anyone buying them. On close examination a number of the apples showed defects other than bruising. The manager explained his company bought No. 1 apples (and O'Neill said that was correct). The manager said customers who bought apples picked out the best so that gradually the poorest were left. Bruises and incipient rot became worse day by day in the leftovers.

We suggested he might better pick out all the poor apples in the display and throw them away. On that basis the remainder might look good enough to sell. He said his apple sales had dropped off and citrus fruit sales had jumped up.

Purpose of Box Defeated

The bushel basket gradually met with a lot of disfavor on account of the "bulge" pack. I have seen such packages, each with the top bulged to a higher center, stacked in warehouses and elsewhere. Think of the weight on the bulge and how it must squeeze or bruise apples!

When the box came into general use for eastern apples it was hailed as ending squeezing and bruising due to bulge pack. The ends of the box have "risers," or higher ends than sides, designed to carry the weight. Now we find many boxes packed with a bulge. Growers complain this is necessary if

they are to sell their apples. Actually, the boxes packed with a bulge contain about a bushel and one-fifth. Buyers prefer the extra apples and growers complain they have to give away part of their crop. From every angle the bulge is an evil and the sooner the industry gets together on it the better off all concerned will be.

Institute Helps Sales

The New York and New England Apple Institute is four years old and has done an excellent piece of work for growers in the Northeastern States. It is a co-operative, supported by voluntary contributions of one cent per bushel on packed apples. It believes there is no sense in growers in the Northeast competing against each other, but that all should co-operate to increase the demand for the apples grown in the Northeast.

The institute has operated on a very limited budget. All growers benefit, but many prefer to be "free-riders" rather than to co-operate in sharing

the cost. The institute has worked with chains and independents and has been directly responsible for eastern apples replacing western apples in many places. It has won the respect of the trade and in the opinion of competent observers has had considerable influence upon the price growers have received.

It is true that apple prices are lower than they should be. This is due to three things: (a) A depressed general price level for all farm products; (b) tremendous competition of competing fruits and the effective sales drives behind those fruits; (c) failure of Northeastern apple growers over a long period of years to do anything about selling the trade and public on the merits of their apples.

Apples can be sold, by concerted effort. Last year's emergency drive proved that. Out-of-storage movement of New York apples this season has been exceptionally good. The three factors mentioned above are drags on sales and prices.

Steuben County Potato Show

OPTIMISM for the future of the potato industry in Steuben County was the keynote of the 12th Annual Potato Growers' Convention which brought together at Cohocton on Feb. 23, 24 a record attendance of growers from all parts of the area, and which was featured by the biggest potato show ever held in New York State.

A headline speaker of the session was G. W. Lamb, President of the Bank of Cooperatives, Springfield, Mass., and a potato grower of Hubbardsville, Madison County, who stated that because of favorable soil and climate and proximity to the metropolitan markets, Steuben is especially favored as compared to other important potato producing areas.

The Grand champion award of the potato show which brought together 169 entries, went to Alex Bronson of Cohocton, his exhibit having placed 1st in the Smooth Rural class in which there were 87 entries. In the same division Frank Wager of Cohocton, grand champion winner of former shows, placed 2nd.

The entry of Alta Keeler of Cohocton placed 1st in Class B in which there were 48 entries, and the second award in this division went to Harold Putnam, the grand champion exhibitor of the 1938 show. First and second in the Green Mountain class were George Mehlenbacher and Leon Mehlenbacher of Wayland, and the best exhibit in Russet Rurals was that of Clifford Zimmer of Cohocton, with Carl Mallober of Cohocton second.

Lee Edmond, Cohocton, chairman; Leonard Drake, Prattsburg, member of the potato committee; Murray Barnes, Avoca, and Aden Ingalls, Arkport, members of the Steuben County executive committee, inspect pecks packed by Cohocton shipper.

In the Katahdin class George Mehlenbacher of Wayland also placed 1st, and The Gardner Farms of Tully won 1st and 3rd in the seed exhibit, with 2nd place won by Fred Hollenbeck of Tully. Seed growers throughout New York state competed in this division.

Subjects treated in the exhibits were the breeding of potatoes, a collection of new and old varieties, and illustrations of insects and plant diseases peculiar to the potato. Outstanding feature of the show was the display of consumer packages collected from every commercial area of the U. S.

The meeting was held under the auspices of the potato committee of the Steuben County Farm Bureau, of which committee Lee Edmond of Cohocton is chairman.

HIGHLIGHTS OF THE FIGHT FOR A LIVING PRICE FOR MILK

The Outlook for Milk Prices

PART IV.

By LELAND SPENCER.

SO FAR in this series of articles on the outlook for milk prices we have not considered the effect of arbitrary price fixing by public authorities. Now, as result of the adverse court decisions on the Federal and State system of regulation, this matter is receiving far more attention than the conditions of supply and demand or the trend of commodity prices.

Leland Spencer

Evidently the Federal and State orders under which the prices paid by New York milk dealers have been regulated since last September cannot be enforced unless and until the decision of Judge Cooper is reversed by the United States Supreme

Court. That will be a matter of months, and surely will not come soon enough to have any effect on milk prices this spring.

Meanwhile, efforts are being made to continue the former schedule of prices, and the equalization plan, under uniform private contracts between producer groups and the dealers. With present production outrunning the demand

by a considerable margin, with the milk flow due to increase from week to week as spring advances, with markets for butter and other dairy products in a weak position, and with more than 100 milk dealers fighting against this plan, it is obvious that success can be achieved only by extraordinary efforts of the farm leaders and greater unity of support among the dairymen than has been seen in many years.

There was a somewhat similar situation in the spring of 1937, when price fixing under the New York Milk Control Law was abandoned. Some comparisons of prices and other conditions for January 1937 and January 1939 are given below:

Item	Jan. '37	Jan. '39
Class 1 price (per cwt.)	\$2.45	\$2.45
Net price to farmers (per cwt.)	1.85	1.85
Dairy ration (wholesale, per cwt.)	2.15	1.35
Basic commodities (index, 1910-14=100)	136	107
Butter (wholesale price per pound)	\$.34	\$.26
Retail price, fluid milk	\$.13	\$.13 3/4
Store price, fluid milk	.11	.10 1/2
Store price, evaporated milk	.08	.07
Milk receipts at New York (index)	108	108
Business activity (N. Y. Times index)	104	92
Milk production per farm (lbs. per day)	194	201

In each case the Class 1 price was \$2.45 and the net price to farmers \$1.85 per cwt. In 1937 the Class 1 price dropped from \$2.45 in January to \$1.65 in May, after price fixing was abandoned. The net price to farmers for 3.5 per cent Grade B milk fell from \$1.85 in January to \$1.43 in May. This was considerably more than the usual de-

cline during those months.

Present conditions are less favorable than those which prevailed in the spring of 1937. The general level of prices, as well as the prices of manufactured dairy products, is lower. The price of butter, although supported by Government buying, is lower by 8 cents a pound. Milk production is higher, while with business less active, consumers have less to spend for milk and cream, and for the other necessities of life.

Due to the evident unity among dairymen on this issue, and the support of the more responsible milk dealers, there is strong hope that efforts to continue arbitrary stabilization of milk prices will succeed. But it is well to consider the alternative. Should these efforts fail, the net returns to farmers would fall sharply from recent levels.

They probably would range between \$1.20 and \$1.35 per cwt. until either reinstatement of the Federal-State control program is permitted by decisions in the higher courts, or the milk flow is curtailed by hot weather and dry pastures.

In any case, the New York dairyman may take some consolation from two facts in the present situation. The first is that feed prices are low. The second is that nearly everyone is suffering from the same trouble as himself — namely, a price level that is too low to permit a normal exchange of goods and services between the farmers, laborers, consumers, and other groups. I wish to be counted among those who believe it is better to raise the price level by appropriate monetary action than to put emergency props under the prices of various commodities.

One well-placed tile line may spell your difference between profit and loss.

Acme Durable Drain Tile

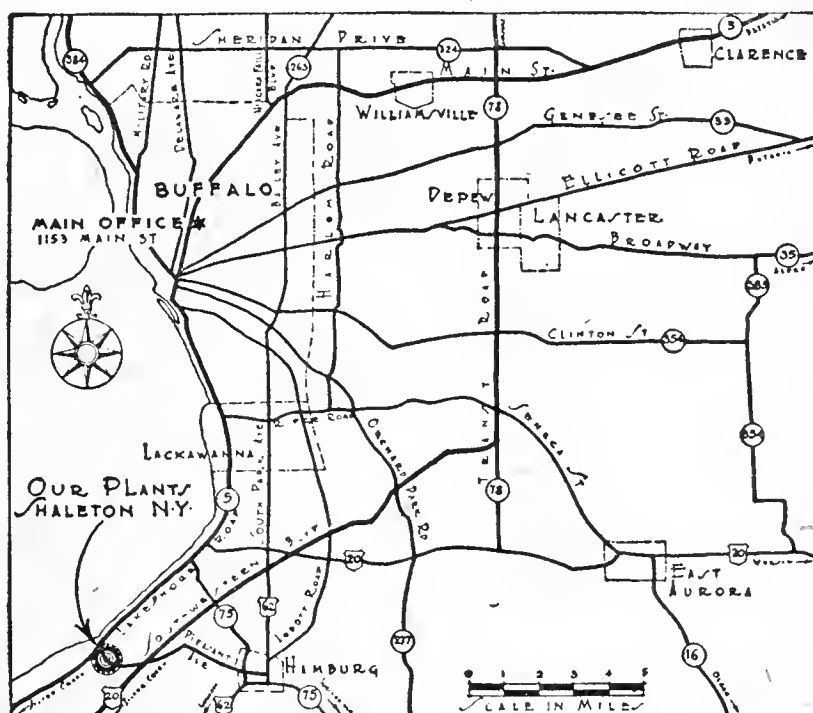

For years we have been cooperating with the farmers and growers of Western New York by making our famous drain tile to fit their practical requirements — we are farmers ourselves, but even so have consulted with our neighbors and customers constantly.

Now Our Tile Are Considered Perfect!

Acme Drain Tile are durable. We sold more than ever again last year BECAUSE: they are properly-designed; light to handle; snug to lay; well burned; serviceable, long lasting, and reasonably priced.

Made in 3" — 4" — 6" sizes.

Ask for prices on truckloads and carloads.

We also manufacture BRICK and BUILDING TILE. Brick for Septic Tanks. Brick for Walks and Walls. It will pay you to brick up your water supply.

Acme Shale Brick Co., Inc.

1153 Main St., Buffalo, N. Y.

Telephone GRant 2091

SAVE MONEY By trucking from our handy plant, but phone first to make sure your tile are ready for loading.

START THE SPRING SEASON RIGHT!

Cows are freshening and milk production is increasing.

There is still much uncertainty in selling fluid milk — as to dependability of the market, the price, etc.

We guarantee you a market for all your CREAM the year round and we make payment promptly for each shipment at top market price.

You have the fresh skim milk on the farm for raising Calves, Pigs and Chickens when you sell cream. The additional income is well worth considering.

CHOOSE YOUR BEST CREAM MARKET NOW for this year.

Plowing Contest Winner

LAST FALL Paul Stiefbold (shown at the right), 22-year-old farmer of Naperville, Ill., won the 61st Annual Wheatland, Ill., National Plowing Match. At the left, W. W. Boughton, President of the Wheatland Plowing Association, presents the silver cup; while Mrs. Stiefbold looks on her partner with pride. The tractor is equipped with Firestone tires.

Wayne Dinsmore, Secretary of the Horse and Mule Association of America, says the index price for harnesses shown on page 16 of the November 5, 1938, issue is too high. Mr. Dinsmore says:

"I am aware that the Farm Equipment Institute, which got out the chart you reproduced, took their figures from the U. S. Bureau of Labor Statistics, but that does not prove that their computations, showing that harnesses are selling 227 per cent higher than in 1913, are correct."

Mr. Dinsmore quotes several authorities. One manufacturer reports a 44 per cent advance in harness prices since 1913. Others report advances over 1913 as follows: 60 per cent, 42½ per cent, 40 per cent, 20 per cent, and 50 per cent.

The Goodyear Tire and Rubber Co. of Akron, Ohio, have announced their 1939 essay contest for high school students in Vocational Agriculture. The subject of the contest is "Farming of Tomorrow on Rubber." If you are interested, send for an entry card and you will receive a booklet, "How Farm Tires Were Developed." The closing date of the contest is midnight, May 15, and the ten winners will receive an all-expense vacation trip during August to Akron, Cleveland, Detroit, and Timagami, Ontario.

Fairbanks, Morse & Co., 990 S. Wabash Ave., Chicago, Ill., have announced a new line of hammer mills. This illustration shows the flint-hard hammers which, whirling at the rate of 2200 revolutions a

minute, exert a striking force of 12 tons a second against grain and roughage in the mill.

One of the immediate jobs for poultrymen is a start toward the raising of pullets for next year's flock. Where pullets are raised on the range, portable brooder houses are in order. The Martin Steel Products Co., 724 Longview Ave., Mansfield, Ohio, has developed a round metal brooder house, pointing out several advantages including resistance to fire and safety from rats and weasels.

Dr. Salsbury's Laboratories, Charles City, Iowa, have printed a 36-page book-

"I'm going over and take this job, myself"

let called "First Aid to Poultry." You can get a copy from a dealer who handles Dr. Salsbury's products, or by writing direct to the address given above.

There is still time to enter the contest which is being conducted by the De Laval Separator Co., 165 Broadway, New York City. The contest closes April 30. If you do not know your nearest De Laval dealer, where entry blanks can be obtained write to the New York City address given above.

This illustration shows the front page of the new catalog of the Robson Seed Farms, Box 32, Hall, N. Y. A post card to this company will bring you a copy of the catalog.

Fruit growers who need more information on spraying may write to the Phelps Dodge Refining Corp., 40 Wall St., New York City, for a booklet on fungus control.

The International Harvester Co. has issued its annual report for 1938. The report shows for the year ending October 31 a net income of \$18,472,000, a considerable drop from the 1937 figure of \$32,493,000. The grand total of all sales, foreign and domestic was \$282,361,000 in 1938, compared to \$351,928,000 in 1937. In this country during the year the company had an average of 47,106 employees, compared with 59,347 in 1937.

The Solway Sales Corp., 40 Rector St., New York City, has just published a new booklet "Calcium Chloride in Portland Cement." Post card requests to the above address will bring a copy to you.

An attractive catalog has just reached our desk from the Wene Chick Farms of Vineland, N. J. It is more than a catalog. It contains useful information about breeding, culling, blood testing, and sexing.

New England readers will be interested in plans for constructing poultry houses and equipment just issued by the Wirthmore Poultry Service Department. If interested, ask your local dealer for a set of these plans.

There is more to calf raising than just saving a heifer and watching her grow. You will find "Calf Husbandry" helpful. Send for a copy to Ryde & Co., 5425 West Roosevelt Rd., Chicago, Ill.

The Milwaukee Milk Producer recently carried a tribute to Edward J. Gengler for his part in developing the use of electric fences. Mr. Gengler is now associated with the Prime Manufacturing Co., manufacturers of Prime electric fence controllers.

The American Potash Institute, Inc., Investment Building, Washington, D. C., have a number of bulletins on fertilizing crops. Drop them a post card telling them what crops you grow, and they will send you these booklets.

NEARBY MARKETS for NEARBY POULTRYMEN

Caution Please!! By J. C. HUTTAR

A COMBINATION of more eggs set by the hatcheries of the country, plus better hatches than last year, gave us an increase of 58 per cent in salable chicks hatched in January 1939 over 1938. This is from the federal government's monthly hatchery reports.

J. C. Huttar

The February report isn't out yet, but, judging from my conversations with quite a number of New York and Pennsylvania poultry breeders, I don't think there has been too much of a slow-up yet. In fact, the 413 hatcheries which reported their advance orders, both last year and this, show a 29 per cent increase in orders booked for February or later delivery this year as compared to last.

Big increased hatches were reported all through the late fall and early winter, but I haven't paid too much attention to this because a large portion of those chicks were hatched for commercial broiler plants. In the January figures we undoubtedly still have some broiler chicks, but egg chicks are quite a portion of the total.

Heavy Breeds and Sexing

There are some interesting things to get out of the January report. The Rocky Mountain states show the biggest increase over last year, and the Pacific Coast states the smallest. This holds true both for number of chicks hatched in January and orders booked for February or later delivery. The Middle Atlantic states, which include New York, New Jersey, and Pennsylvania, are well above average. New England, which has been the fastest growing poultry section in recent years, is apparently slowing up a little and is right near the average.

We, in this section of the country, sometimes get to thinking that the Leghorn is about the only breed hatched for egg production. Recognizing that a good chunk of the January hatch is probably still for broiler production only and, therefore, heavy breeds, yet the small proportion of the

light breeds for the whole country will surprise some of the folks in this area.

Only 26 per cent of the January chicks are of the light breeds. That's the same percentage as in January 1938. Only our own Middle Atlantic states and the Pacific Coast show more light breed chicks than heavies. New England hatched 97 per cent heavies, and the northern Corn Belt 96 per cent.

The sale of sexed chicks is also increasing by leaps and bounds. The increase was 129 per cent over last year for the month of January. The practice is most common in the Middle-west and least on the Pacific Coast.

The Whole Hatch

January is hardly the month on which to base predictions (guesses, I call them) of what the total hatch will be. We must remember that most of the eggs which hatched these chicks were set before the big drop in egg prices came in early January. We must also remember that we've had a second, even more drastic, drop in egg prices at the end of February. And finally, we must remember that feed prices have advanced a little since Christmas.

I'm told by my good friend Al van Wagenen of Cornell's Department of Agricultural Economics that the egg-feed price ratio in March and April goes more closely along with the total size of the year's hatch than anything else. Right now this ratio is not much if any, more favorable than it was last year, and is not as favorable as the past 10-year average for the first week in March.

My judgment is still on the side of caution. Caution about expansion — I don't think this is the year for it. Caution about quality of stock — it will take better birds to show a profit this year. And caution about culling — practice more of it this year.

On the other hand, if I dare put a note of optimism in this, I would say that these low egg prices, plus the reported increase in business activity, may yet take most of the sourness out of 1939 egg production.

But Caution Please!!

Don't Throw This Aside

You mustn't dismiss this coming World's Poultry Congress too easily from your plans and conscience. It's (Continued on Page 18)

Just one of the Buildings on the Bingham poultry ranch at South Edmestor, Chenango County, N. Y. On one floor are 1,200 pullets, running together without partitions. When asked concerning the danger of cannibalism, Mr. Bingham said: "I figure if I manage them right, there is no danger that they will develop that trouble."

Though started late in the fall, the lawn in the foreground made wonderful growth before winter set in. It was fertilized with Pep-to-lizer, dried reinforced poultry manure which Mr. Bingham mixes and sells in bags. Mr. Bingham has spent considerable time developing this important by-product of his 20,000 laying hens.

Remarkable Success

Raising Baby Chicks

"Dear Sir: I see reports of so many losing their little chicks, so thought I would tell my experience. I used to lose a great many of the little downy fellows from bowel troubles, tried many remedies and was about discouraged. As a last resort I tried Walko Tablets. I used two 50c boxes, raised 300 White Wyandottes and never lost one or had one sick after using the Tablets and my chickens were larger and healthier than ever before."—Mrs. C. M. Bradshaw, Diagonal, Iowa.

You Run No Risk

Buy a package of Walko Tablets today at your druggist or poultry supply dealer. Give them in all drinking water from the time chicks are out of the shell. Satisfy yourself as have thousands of others who depend on Walko Tablets year after year in raising their little chicks. You buy Walko Tablets entirely at our risk. We guarantee to refund your money promptly if you don't find them the greatest little chick saver you ever used. The Waterloo Savings Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee. Sent direct postpaid if your dealer can not supply you. Price 50c and \$1.00.

Y.; Laura Baskerville, Box 242, Deposit, N. Y.; Mrs. Clarence Mahuson, East Rochester, N. Y.; Mrs. Albert L. Abbott, Rumford Point, Maine; Frye Dennis, Willow Bend Farm, Canisteo, N. Y.; L. C. Bennett, Hunt, N. Y.; Mrs. Harold Taft, East Randolph, Vt.; Fred S. Judkins, Upton, Maine.

THE BABY CHICK Contest announced in the January 21 issue brought the best lot of answers of any contest we have ever had. We spent a lot of time picking the winners and, of course, we are sorry so many had to be disappointed.

But, as many contestants stated, the real benefit lies in the facts learned. Then, too, there is always another chance. For example, in the March 4 issue on page 3 there is an announcement of a Soil Fertility Contest, answers to which must be postmarked not later than March 27. Start in now to answer those questions.

A few questions in the Baby Chick Contest caused the most trouble, and

Raymond W. Hoy of Newfane, N. Y., Niagara County's 4-H Club poultry champion for 1938, has proved it is possible to start from scratch and build a profitable poultry business in less than a year's time. Raymond's balance sheet for 1938 shows he was \$175.55 in the black, to say nothing of having left a business worth \$515.90 from which \$340.35 of expenses has been deducted. He started his venture last spring with 2100 hatching eggs which cost him \$57.50. Of this number 750 birds hatched, and he made his money through the sale of broilers and eggs. His feed bills have averaged \$45 a month.

while we can't answer every question completely, we will try to give a few points that bothered many.

Quite a number of people listed the symptoms for pullorum and coccidiosis, but didn't tell how they could tell them apart. The judges felt that the important thing was that pullorum attacks very young chicks and coccidiosis comes when they are several weeks old. As many mentioned, a certain way to get a positive diagnosis is to send chicks to your State Veterinary College.

On question 2, an important point which many brought out but some missed was that statements "breeders blood tested" and "all breeders blood tested for B.W.D. by stained antigen method" do not tell when the breeders were tested nor whether or not the test found them clean. There is always a possibility that one test will miss a few re-actors.

On question 3, a good many contestants mentioned, among other precautions, that young chicks should not be given ice-cold feed and water. The judges consider that important. A chick is so small that regardless of what other precautions you take, filling him up with cold feed and water is likely to chill him.

On the true-false statements, most answers were correct. The judges ruled that the statement, "It is essential that chicks get on the ground", is false. With modern feeding methods, many chicks are now raised successfully in batteries and never set foot on the ground. Therefore, it is not "essential" that they get on the ground.

The other true-false statement which was most commonly missed was, "A poultryman should order three chicks for every pullet he will need in the fall." The judges ruled this statement was correct. Of course, with good management, many poultrymen raise chicks with minimum losses; but there is always a chance of losses heavier than anticipated, and the judges feel it is important to have pullets enough in the fall so that some culling can be done when the pullets are put into the laying houses.

We want to thank every contestant and urge all of them to try the Soil Fertility Contest. Also, watch future issues. We plan to have at least one more contest and possibly several.

Support the World's Poultry Congress

The question "How will the World's Poultry Congress benefit me?" is a question every poultryman may logically ask. The answer, from the dollars and cents viewpoint, is the possibility of increasing consumption of poultry products. A few years ago Canada, our neighbor across the border, was host of the Congress, and following the session, reported a 30 per cent increase in egg consumption.

The World's Poultry Congress, which will be held in Cleveland from July 28 to August 7, is more than a poultry show. Plans to interest consumers are an important part.

If, as a result of the Congress, consumption is increased 10 per cent, it will mean an added annual income of from seven to eight million dollars to Northeastern farmers.

You may or may not be planning to attend the Congress. We hope you will, but if you cannot go, that doesn't

(Continued on Page 18)

Poultrymen!

TAKE A LESSON

Support the World's Poultry Congress

(Continued from Page 17)

end the matter. The Congress is still worthy of your support. In other countries the Congress has been largely financed by the government. In this country money must come from the poultry industry.

Every poultryman is asked to buy an associate membership which will cost him \$1. When you are asked to buy, remember that you are investing a small sum which will pay real dividends.

Caution Please!!

(Continued from Page 16)

bound to mean too much for the poultry industry and that includes you, if you have any chickens.

The Congress itself (July 28-August 7 are the dates) will be a grand show. Not government subsidized, but financed by poultry keepers, hatcheries, feed dealers, equipment companies, and many others, whose prosperity is affected by the prosperity of poultry keeping.

With the low rates of travel on many of the organized tours, the cost of the trip is going to be very reasonable.

Science, popular programs, rare bird exhibits, the best poultry competition the country has ever had, consumer appeal, and dozens of other features have been well planned. Cleveland is a beautiful city, worth visiting on anybody's vacation.

Commercial exhibitors have pretty well bought up the space available for this sort of thing. Foreign countries

and most of the states have their spaces reserved.

Now, I'm talking to the hen men of New York, New Jersey, and Pennsylvania.

To those in New Jersey, I say congratulations! By the last Congress bulletin I have seen, I note that you've gone 'way over the top on your individual Congress membership.

To New York and Pennsylvania poultry keepers I say, "What's this I see? Do my eyes deceive me or are these two states really down near the bottom of the list in this regard?" Isn't the success of this Congress worth a dollar of any poultryman's money once in a "blue moon?" Don't we suffer here because egg consumption has been hit by other foods, which are well advertised?

I think we need the stimulation which a bang-up good Congress can give to egg consumption as it did in Canada in 1927.

So don't dismiss this Congress too lightly from your minds. It's an easy job if everybody's back of it. It's a back-breaker if a lot of folks don't care.

A membership is only \$1.00, and that entitles you to entrance to the exhibition for as many days as you want to go.

I'll be looking for you in Cleveland next summer.

Anyone who is in doubt as to where to get such a membership card can send me a check for \$1.00, made payable to the Seventh World's Poultry Congress. Tell me what county and state you are in, and I'll see that they get credit for your membership. I'll send you the membership card.

SEVENTH ★ AMERICAN AGRICULTURIST ★ GRANGE ★ CONTEST

BREAD-MAKING

Contest
FOR
GRANGERS

By MABEL HEBEL

I FEEL SORRY for any one who has never had the fun of coming home and being greeted by that most tantalizing of all odors — home-made bread fresh from the oven. To go out to the kitchen, perhaps be allowed to cut-off an end crust from a warm, sweet-smelling, well-browned loaf, spread it with golden farm butter, and consume it on the spot—was there any greater pleasure in those good old days before store bread came to rob many of us of it?

No one will deny that baker's bread has helped to make life a lot easier for women, and rightly so; but we think it would be a great pity if the art of baking home-made bread should become lost entirely. Every woman ought to be able to treat her family to it at least occasionally. So last month when the subject of this year's *American Agriculturist*-Grange baking contest came up, we proposed to the State Chairman of Service and Hospitality Committee, Mrs. Nehemiah Andrews, that it might be a good idea to have a bread contest just to prove that Grangers can still bake prize-winning loaves of home-made bread. Mrs. Andrews immediately agreed, and so the thing is settled. It's to be a bread contest, and we bet that the men folks will applaud the idea and be glad to have you practice on them as often as you like!

This contest, the seventh one to be sponsored jointly by the New York State Grange and *American Agriculturist*, is open to every Grange woman in this State, and, as usual, we will be glad to have any Grange brothers compete who want to. Last year they made some mighty fine gingerbread, and won several Subordinate Grange contests.

Instructions and Score Cards

In charge of the contest for the Grange will be State Chairman Mrs. Andrews, of Montgomery, N. Y., assisted by chairmen of Pomona and Subordinate Grange Service and Hospitality committees. Complete instructions with score cards will be mailed to all Granges some time during March. Since we do not have addresses of Subordinate Grange Chairmen, this material will be addressed to Subordinate Grange Secretaries, with the request that they pass it on immediately to Chairmen of Service and Hospitality committees. Any chairman who fails to receive her set of instructions by April 1st should get in touch at once with the Secretary of her Grange, or with the Bread Contest Editor, *American Agriculturist*, Box 367, Ithaca, N. Y.

As in previous years, there will be a series of three contests—local, county, and state. Subordinate Granges will hold theirs first, probably in April, May and June. First prize winners in

"No store bread for my family," says Mrs. James Stone of Marcellus, N. Y.

these contests will then compete with each other in Pomona contests. In the final State contest to be held next December during State Grange Session, county champion breadmakers will pit their skill against each other to see who wins the title of State Champion Bread Baker along with a slew of valuable prizes.

Cash and Merchandise Prizes

Twenty cash prizes, totalling \$60.00, are again offered this year by *American Agriculturist* to State Contest winners. These prizes will be divided as follows:

First Prize	\$25.00
Second	10.00
Third	5.00
Fourth	3.00
Fifth	2.00
Sixth to Twentieth.....	1.00 each

Besides these cash prizes, there will be many attractive merchandise prizes awarded to both State and Pomona winners by *American Agriculturist* advertisers. These prizes will be announced later and will be well worth winning. Last year commercial companies gave over 350 prizes to county and state winners. Some of these were displayed with gingerbread entries at Jamestown last December during State Grange Session, and many Grangers were heard to exclaim, "Oh, I wish I had entered this contest!"

Contest Rules

The rules are few and simple. Here they are:

Rule 1. Contest is open to every Grange woman (or man) in New York State, who is not a professional baker. Each contestant is entitled to enter one loaf of white bread.

Rule 2. Each contestant must fill out the Bread Contest Score Card. Chairmen of Grange Service and Hospitality Committees will soon have these to distribute. In filling out the score card, be sure to answer plainly all questions on it, sign your name, address, grange and county. Your score card must accompany your entry of bread. No entry will be accepted unless there is a properly filled out score card with it.

Rule 3. Before making your bread for the contest, study carefully the score card, as it tells on

what points judges will score entries. We are not suggesting any special recipe to be followed, as we want contestants to use any recipe they wish to.

We hope that every Grange woman, young and old, will take part in this interesting contest, if only just to prove to the world that farm women can still bake delicious bread. Even though you have not baked bread in ages, try your hand at it once more and see how good it seems to have real homemade bread again. And if you have never baked a loaf of bread in your life, give yourself the fun of this experience. It is easy to bake good homemade bread, particularly when there are worth while prizes to be won.

As soon as the contest is announced in your Grange, get a score card from your Grange chairman of service and hospitality committee, and plan to take part. Names of first prize winners in Subordinate contests will be printed in *American Agriculturist*. Watch coming issues for these names, as well as for list of merchandise prizes to be donated by *American Agriculturist* advertisers.

Last year, nearly every Subordinate Grange in the State took part in our gingerbread contest, and we received hundreds of letters from Grange Chairmen telling us of the interest which the contest created and the increased attendance which resulted on the night that the judging took place and winners were announced. We are urging Granges to make Bread Contest evening a gala event for their members this year, and to plan to serve homemade bread with their refreshments. In addition to the bread entered in the contest, why not ask the contestants and others to bring some extra loaves and biscuits that night, so that there will be enough to go around? Announce in advance that refreshments will include homemade bread and biscuits with honey or maple syrup, and watch the members turn out for this—particularly the men folks!

We of the staff of *American Agriculturist* feel that this is going to be one of the most interesting contests that we have ever sponsored jointly with the Grange, and we are looking forward very much to working with our Grange friends again in a project which we feel is both entertaining and educational.

Capture Spring's Freshness

CONSERVATIVE navy or black is always smart for spring, but the season's freshness is captured in the new color-on-color prints. New colors on unusual backgrounds which are distinctly refreshing are: navy with pink, periwinkle with fuchsia, mustard with purple, blue with spring wine and char- treuse with cinnabar.

Dress Pattern No. 3367 has style in every line and is equally useful for spring silks or for summer voiles. Sizes run 16, 18, 20 years, 34, 36, 38, 40, 42, 44, 46, 48 and 50-inches bust. Size 36 requires 3¼ yards of 39-inch material with 1½ yards of plaiting.

Pattern No. 2944 gives a "little girl" silhouette, cuts in one piece from neck to hem, the fullness being held in with a belt. Very easy to make, very be-

HERMAN'S GETTIN' ETIQUETTE—HE'S BUILDIN' THE HOUSE SO HE CAN DRINK HIS SOUP WITHOUT TIPPIN' THE PLATE.

coming and very useful for many occasions. Pattern sizes are 11, 13, 15, 17 and 19 years. Size 15 requires 4¼ yards of 39-inch material with ¼ yard of 39-inch contrasting and 1½ yards of binding.

TO ORDER: Write name, address and pattern size and number clearly and enclose 15c in stamps. Address Pattern Department, *American Agriculturist*, 10 North Cherry St., Poughkeepsie, N. Y. Add 12c for a copy of our new Spring Fashion Guide. You will find it full of smart styles for each member of the family.

Today in Aunt Janet's Garden

A Wild Garden Hobbyist Writes

A READER who has had considerable success transplanting wild flowers gives the following hints as to how she does it. She never takes them from beside the road nor does she take all from any one place. She also tries to set them into a place as nearly like their original home as possible. This reader, Miss Cora Weston of Reeds Ferry, New Hampshire, has the following to say about specific plants which she considers suitable for average garden soils:

"First in my preference is the wild geranium, *Geranium maculatum*; this has a profusion of magenta flowers and adapts itself readily to all soils. When the blooming period is over, the leaves remain all summer in rounded groups about a foot high which are very pleasing until snowfall.

"The wild, red columbine, *Aquilegia canadensis*, is equally adaptable and looks fine with the white, pink and purple cultivated sorts.

"For a blue flower which closely resembles veronica, the Monkey Tail, *Verbena hastata*, is usually found near streams but does not require wet soil. Butterfly weed, *Asclepias tuberosa*, is of the milkweed family, a beautiful bright orange that will create interest in any garden. Butter and eggs, *Linnaria vulgaris*, is a charming yellow plant about 10 inches high. Pearly everlasting, *Anaphalis margaritacea*, besides being a pleasing white summer flower, can be dried for winter bouquets.

"Some very special wildflowers from 3 to 5 inches high that cultivate well are the many kinds of violets, the hepaticas, *Hepatica triloba*, and blood-root, *Sanguinaria canadensis*.

"For two tall ones the Meadowrue, *Thalictrum polygamum*, is white, feathery and from 3 to 5 ft. tall. The same height is the yellow ten-petaled sunflower, *Helianthus decapetalus*. The latter spreads but is worth having if you need a tall yellow flower.

"Two of the wood lilies are especially nice and cultivate well, the freckle lily, *Lilium philadelphicum*, and the meadow lily, *Lilium canadense*; the hardest thing about these is finding them when they are dormant. The best way is to mark them when in bloom by driving a small white stake at a distance of about 5 inches from each side of the stalk. In late fall transfer the bulbs to your garden.

"Most of the wild roses would spread too much, but if you can get an old fashioned sweetbriar, *Rosa rubiginosa*, it is quite a charming shrub, with long gracefully arching branches, a profusion of single pink flowers in early spring and the foliage has a spicy fragrance. The branches are plentifully supplied with bright red seed pods which stay on all winter. This is one wild rose that does not spread.

"Now here are two don'ts in wild flower gardening. Don't let wild asters or goldenrod get started in your garden. They are very lovely in fields and along roads but a terrible pest in gardens because of their spreading habit.

For you who win Bread-Contest Prizes... A WORTHY REWARD!

Sixty-three 24½-lb. bags of Pillsbury's Best Flour are among the state and county prizes to be awarded in the American Agriculturist's bread-baking contest.

AND FOR EVERY WOMAN A MEANS OF DOING PRIZE-QUALITY BAKING

COMPLETE INSTRUCTIONS ENCLOSED IN EVERY BAG OF PILLSBURY'S BEST FLOUR

There's a special new recipe folder packed in every Pillsbury's Best bag. It contains instructions for baking better cakes, bread, biscuits, and pies. It shows you the methods used by experts who win prizes for their baking. It shows you how to put this kind of baking on your table *every day!*

A FLOUR THAT PUTS PRIZE-WINNING QUALITY INTO SIMPLE BAKED FOODS

Pillsbury's Best makes a simple two-egg cake a real delight. It makes light, tender, fine-flavored biscuits, and flaky, tender pie crust. It makes prize-winning bread... light, golden-brown, full of flavor. Yet it's not expensive to use, for it goes further than cheap flour, and causes no baking failures. Get a bag... begin tomorrow to win "blue ribbons" at home.

MUFF — A Serial Story By C. A. STEPHENS

A SERIAL

Judging from the enthusiastic letters of readers, we should continue to print the old C. A. Stephens stories just as long as the supply lasts. There has been some request for serials so on this page we are starting "Muff" which will run in several chapters. Be sure to read this first installment, and we guarantee that you will follow it to the end.

CHAPTER I.

IN OFFERING "A Story for Bad Boys," it need not be inferred that the writer wishes to imply that the boy-readers of this paper are of that unfortunate genus. By no means. Yet if by chance a bad boy should take up the paper, and read this story, the author hopes that the career of Muff may prove to be of special interest and profit to him.

* * *

It was the evening of the 11th of October, the second day of the County Fair at Rockville Corners, and this commonly quiet little place had overflowed with people all day long.

It had been one of those phenomenal days, such as the State of Maine sometimes experiences early in October. There had been a sharp frost the night before. The morning was rough and cold; yet by ten o'clock in the forenoon the sun shone so fiercely that everybody tried to get into the shade.

At about two in the afternoon, however, a black thunderstorm rolled rumbling across the county, with drenching rain, wind, and a few big hailstones. Scarcely had it passed, and the sun come out again, when still another rain-cloud gathered; in short shower followed shower till into the evening, when the weather turned very cold and windy. Such was the day.

The next day the horse-trot was to come off. The little public house was crushing full of people; every house, indeed, was crowded—except one. People even slept under sheds and in the Fair building on horse blankets, and some said, on the exhibition quilts and rugs—a report which led the highly incensed makers to declare that they would "never take anything there again, never!"

The one house where there were no visitors that night was the little brown cottage on the road leading out eastward from the Corners, about fifty rods from the Fairgrounds, where the "Ransom girls" lived. The folks there always spoke of them as the Ransom "girls" though Marcia was nearly fifty years old and Mary was but little younger; but they were unmarried and had always lived there together, at least, ever since we of the younger generation could remember. Only a few spiteful persons ever called them "old maids", though they had some of the peculiarities of that estimable class of persons, being addicted to cats, and being "fussy" and "awful particular." They owned their little patrimony, also a cow and a flock of geese, and lived in comparative comfort—on thirty dollars a year, so their neighbors said. They had no relatives, hence no one visited them, and they did not go to the Fair. The latter was a perfect terror to them, and they had kept their door locked all day.

It was long after ten o'clock that night before the Corners grew quiet, and those poor solitary creatures fairly dared to prepare for bed. Marcia went again—now for the fourth time, certainly—to see if the outside door were really buttoned, with the prop against

it; and as, with candle in hand, she tried the fastenings, she heard a queer little noise outside. A palpitation made her catch her breath. She listened, and held the candle with both hands. Again she heard the queer noise!

"Mairy! Mairy!" she whispered. "Oh, do come here!"

Mary went to her on tiptoe, and they both listened. "It's Clarissy," (their cat), whispered Mary. "She's shet out."

They could not think of leaving Clarissy out of doors, particularly on such a night, when riotous dogs might be racing about. Marcia held the candle and Mary turned the button, pulled away the prop, and opening the door a crack, called softly.

Clarissy did not whisk in, but again they heard that little wailing sound, more distinctly now, plainly on the doorsteps.

"Oh, dear life, she's hurt! Oh, dear soul, a dog's bit her, I do believe!" lamented Mary. Marcia held the fluttering candle, and Mary edged cautiously out, and stepping down, said softly, as she reached out her hands, "Poor kitty! Poor kitty!"

Then she screamed—such an odd scream.

"Oh, for massy sake, Mairy Ann! What is it? Drop it, fling it down, Mairy!" cried Marcia, trembling all over.

But instead of dropping it, Mary ran with it into the house, back into the sitting-room, nearly upsetting Marcia and the candle. Then she screamed again, and shouted deliriously,—

"Marshy! Marshy! Fetch that candle! Fetch that candle!"

Marcia rushed after her with the candle, and by this time Mary had the object set up in the middle of the old-fashioned table and cabinet, propped between the Bible and the Bible Dictionary, and was steadying it with both hands. Marcia looked at it a whole breathless minute, her old eyes dilating; then she screamed louder than Mary, and a palpitation came near ending her life on the spot.

It was a baby in a muff!

Just his little downy head and red,

wrinkled face out at the top end. That muff was all he had on! It was a black cat-skin muff, with a droll little crimson tassel. One parboiled-looking little red foot protruded at the opposite end, and rubbed automatically on the table. Thus my little hero saw the light, the candle light, for the first time, I am inclined to think, for he never once winked at it; only waited ecstatically every second minute. The poor old damsels sat in amazement, Marcia still clutching the candle, and stared at each other in helpless, dumb consternation.

How they passed the remainder of the night I do not know, for they could never tell themselves. Mary fell into hysterics twice, Marcia once, and as soon as it grew light, they were both taken with sick headaches. The idea of feeding the infant did not once occur to them, nor did they take him out of the muff.

But they had concluded what they must do; they must take the baby to the selectmen and "throw it on the town." They had heard of such things being done.

The first selectman of the town, Mr. Murch, lived at the corners of the main road, in an old-fashioned, white, two-story house, with clay-colored shutters, only about a quarter of a mile below their cottage. Mr. Murch was a farmer and drover, a great, breezy kind of man, brown and brawny, with a big voice and big hands; in short, he was big all over, and weighed some two hundred and forty pounds. Some people called him coarse, but he was not so very coarse for his size, and he was always good-natured. The Ransom girls had always known him; they had been boy and girls together.

About sunrise the forlorn sisters bestirred themselves. It must be done. They put on their two black shawls, and their two black straw hats with the green ribbons; they always dressed alike. Then they took their clothes-basket, and Mary stood the muff in the middle of it (Marcia hadn't touched it as yet), and they propped it round with the ironing-sheet and the clothes-pin bag; and then they started out, Marcia carrying one side and Mary

The Time-Saver

Each time he meant to tell her how in Fall

Such slender phrases formed themselves unheard

Upon his lips, and how he hoarded all His winter thoughts and kept them for the Spring.

When March had blown itself out of the year

He meant to take her walking down these ways.

Each time he meant to tell her that the deer

Were getting plentiful and must be shot,

And how the foxes loved the weedy lot.

But when the Spring had murmured through the ice,

And he had time to think of how her hands

Could sleep serenely while her face would pass

Through variant emotions; how the strands

Of wind-worn hair were holiness to him;

Though there was nothing more to make or seek

When with her casual delay of time She turned and brushed delight across his cheek —

Somehow he never found the time to speak.

—Lillian Apken,
950 Union Avenue,
New York City.

the other; and thus our small hero took what was probably his first airing, at least before breakfast, being taken to the selectman to be thrown on the town.

Not many people were stirring so early, and the two women dodged along the road without being observed, at least as to the contents of the clothes-basket, and finally reached the kitchen door of Mr. Murch's without incident. Then Mary knocked timidly.

But it would have taken a loud knock to be noticed inside, for the family were at an early breakfast; and Mr. Bolster, the second selectman, and his wife were there visiting, and Mr. Hobbs, who was a drover. They were all sitting about a great round table loaded with baked beans and Indian pudding; and Mr. Murch, in a loud voice, was telling a funny story, and there was such a confusion of their great voices as would have overcome a small tornado, much more poor little Mary's knuckles.

First Mary, then Marcia, knocked again and yet again.

But by-and-by Mr. Murch got up and came to the door to see about the weather. On opening it, the first thing that met his eyes was Mary and Marcia and the clothes-basket.

Mary, in her little thin, low voice, plaintive with headache and trouble, began,—

"Good morning, Henry; last night, about eleven o'clock, we heard a child cry and found this baby on our doorstep."

But Mr. Murch didn't hear a word she said. He stared; his eyes—his eyes only—trying to take the measure of that remarkable object in the clothes-basket.

Then something seemed suddenly to

The Song of the Lazy Farmer

MIRANDY JANE don't like it when I go to sleep in church again, she says the look upon my face when I'm asleep is a disgrace. My mouth drops open more and more and now and then a peaceful snore. The preacher's discourse punctuates, or rattles the collection plates. She jabs me with her elbow sharp and says I'll never play a harp unless I learn to keep awake. She thinks I ought to for her sake. She's so ashamed when'er I nod, and so she gives my ribs a prod, she says I ain't got no respect for sacred things, and if I'd checked my sleepiness when I was young, then this disgrace that I have brung upon her when I take a nap, would never need to be, mayhap.

But when I hear the organ roll, a sense of peace creeps o'er my soul, and when the minister intones, I can not sit like Deacon Jones, erect and solemn-like and stiff, I just relax, it seems as if my worries just all disappear, and in that peaceful atmosphere, I just sleep all the

sermon through in spite of all that I can do. When church is o'er my spirit is refreshed and full of vim, gee whiz, no matter what the week may bring, I feel that I can smile and sing and meet my troubles with a grin. I feel much better when I've been to church and had a peaceful snooze, an hour of noddin' there renews my spirit, I ain't mean no more, what else than that are churches for?

tickle him, and his roaring laughter quite overwhelmed poor Marcia, who, in her turn, was beginning to say,—

"Last night, about eleven o'clock, we heard —"

Mr. Murch haw-hawed from his low-est chest; then, seizing the clothes-basket in one big hand, he shouted,—

"Look o' here, Rowena!" (his wife). "Rowena, I say! Here, Bolster! Here, Hobbs!" All rushed to the door.

"Bless me! Why the poor little scrimpin' thing!" exclaimed Mrs. Murch, and clapped both hands round the muff and squeezed it. "Why, how—why, what—why, who?"—here she pulled the baby out of the muff—"Marcia Ransom, who put that baby into that muff like that?"

There was now a breathless pause. Then for the first time, poor Mary got in her little narrative.

Here Marcia found opportunity to say to Mr. Murch that she supposed the child must be taken to the "town farm," and that she and Mary only wanted their clothes-basket back.

"Whew!" exclaimed Mr. Murch. "I suppose so. But I don't see how they are going to take care on't at the 'farm' among all those sick paupers and fools. Do you, Bolster?"

Bolster did not; and the two select-men, brought thus suddenly face to face with the naked responsibility of a vagrant baby, began to look sober.

"Wal," said Bolster, at length, "the mother may be found."

Mrs. Murch and Mrs. Bolster did not go to see the horse-trot together, as they had planned with each other; it took them all the forenoon, along with Mary, who did not help them much, to see to the baby—get it dressed, and fed on cow's milk.

Later, too, they got the steelyards and weighed the baby. It weighed four pounds and four ounces. Having recovered their good humor, they covertly took Mr. Murch and Mr. Bolster, when these gentlemen returned home to dinner, to peep in at the sitting-room door, to see Mary Ransom holding the baby. But Mr. Murch must needs betray his presence by an outburst of laughter, whereat poor little Mary turned crimson from brow to neck.

"Now, Mary!" exclaimed Mr. Murch, patting her shoulder in his rough, free way, "you are agoing to take that baby and take care on't—at least till we can find out whose 'tis and what to do with it. And, Mary, the town shall allow ye a dollar and fifty cents, yes, you shall have a dollar and seventy-five cents a week; and I'll send Rob in with a quart of Jersey milk every morning. Now don't deny again, Mary; it's all settled."

Among them all they fairly compelled Mary and Marcia into taking the infant home. So, towards night, the little fellow went back with them in the clothes-basket, but in much better plight than he had started out in the morning. He wailed now without the least difficulty.

The heartless mother was not found.

(To be continued)

YOU MUST WANT TO GET RID OF ME PRETTY BAD TO GO OUT ON SUCH A NIGHT

An Important School Bill

COMMONLY referred to as the School District Modernization Bill, a proposed New York State law now before the State Legislature is of interest to all parents and taxpayers in one-room rural districts. Identical bills have been introduced in the Senate as Print No. 400 and in the Assembly as Print No. 544, and have been referred to committees. The Assembly bill is in the hands of the Ways and Means Committee, Chairman of which is Abbott Low Moffatt; and the Senate bill has been referred to the Education Committee, Joe R. Hanley, Chairman.

Briefly, the bill provides for a Commission of five, and for regional school district committees in each Judicial District in rural areas, this latter committee to be made up of one member from each county in the Judicial District. The duties of the Commission and the committees are to plan and lay out the one-room school districts in the state into a system of central school districts. This, we understand, is to be done by July 31, 1941. There is a provision in the bill for an appeal by 25 per cent of the voters in any central district laid out, but if the bill becomes a law and the districts are finally laid out, they will not be changed.

The second provision of the bill is that a Board of Education of five will be elected to administer the school affairs of such central school districts. The bill does not provide that these central districts, when laid out, must immediately build new high schools. It will be entirely possible for the Board of Education to conduct the school affairs of the district with the buildings just as they are at the time the Board is elected.

The bill does not deprive any existing school district of property belonging to it, neither does it affect the indebtedness of such district. The bill appropriates funds necessary for the expenses of the Commission and committees up to \$100,000.

Quite a number of readers have asked for the facts about this bill. Perhaps a brief discussion of events leading up to the introduction of the bill is in order.

Up to the present over 200 central schools have been organized in New

York State and a vast majority of the parents of the students attending these central schools are enthusiastic about them. In fact, the Department of Education has been embarrassed by the number of applications for central districts rather than by the lack of such applications.

Under the law as it now stands, each of these applications must be decided on its own merits, which is time-consuming and costly. Frequently local sentiment is aroused for a central district in an area too small to be efficient. Frequently, also, districts, when laid out, leave orphan one-room districts stranded, the voters of which may eventually wish to join some adjoining central district.

We believe that the state-wide laying out of central districts, defining the boundaries of such districts to be observed when and if the district votes to establish a central district, is altogether advisable.

We do believe, however, that the bill should be amended to allow the qualified voters in all new central districts to decide whether or not they wish to centralize, and to defer the election of a Board of Education until a favorable vote has been taken.

Certainly the importance of the bill warrants free and open discussion on the part of all rural parents and taxpayers. The bill should not pass until that is done, or until it is amended if a majority of those concerned wish it changed. Following such free and open discussion, we are confident that the wishes of the majority will prevail and that the minority, regardless of which side they are on, will turn to and work harmoniously to provide adequate school advantages for farm boys and girls. The important thing is to study the bill and make known your wishes to your Assemblymen and Senators.

Meeting to Discuss Bill

On April 13 and 14 at the School of Education, Syracuse University, Syracuse, N. Y., there will be a state-wide conference on school district reorganization. The conference is for members of boards of education, school trustees, town officers, superintendents of schools,

Four Unforgettable Weeks

(Continued from Page 5)

strasse to Andermatt, thence via the Rhone Glacier, Furka Pass and Lake of Brienz to Interlaken, noted for its view of awe-inspiring Jungfrau.

AUG. 16 — INTERLAKEN-PARIS. After a leisurely morning in Interlaken, we will take a noon train to Paris, the most fascinating city in the world. This trip to France will give us a fine view of French countryside and farms.

AUG. 17-18 — PARIS. We will have two days in Paris. On the first day there will be a morning program of city sight-seeing, visiting Park Monceau, Napoleon's Tomb, Place de l'Opera, etc. We'll see the beautiful Place de la Concorde with its mermaid fountains and its vista of the Champs Elysees and the Arc de Triomphe; also, the River Seine which flows through Paris and is spanned by a succession of interesting, artistic bridges.

That afternoon, we will motor out to Versailles to see one of the most beautiful and most famous palaces in the world, with its Hall of Mirrors, rooms of Louis XIV, and famous paintings and tapestries. We'll have time to saunter through the gardens and parks, renowned for their fountains and flowers.

The second day in Paris will be left free, to do as each one pleases.

AUG. 19 — CHERBOURG. Leaving Paris by boat train, we will go to Cherbourg and sail for home on the Canadian Pacific S.S. Empress of Britain. There will be five days of fun and rest aboard

our luxurious "floating palace."

AUG. 24 — QUEBEC. Arrive at Quebec and entrain for Montreal. Home again after four wonderful weeks of carefree traveling with a congenial party in the lands you have always yearned to see!

In planning this trip, American Agriculturist is cooperating with the Canadian Pacific Steamship Line and the Travel Service Bureau of Newton Center, Mass., and we are certain that our tour is unequalled at the price at which we are offering it; and in addition you will have the fun of traveling with the finest group of people you could possibly meet. If you would like to join our party, fill out the following blank and mail it to us today:

Dear Mr. Eastman:

I am interested in your European Tour, July 28-August 24. Please send me, without any obligation on my part, full information regarding the trip, with complete itinerary.

Name (Write plainly)

Address

(Mail to E. R. Eastman, Editor, American Agriculturist, Box 367, Ithaca, N. Y.)

taxpayers, parents—in fact anyone who is interested. There will be a number of talks by authorities on school subjects, and these talks will be followed by roundtable discussions by groups of about fifteen.

Those interested in getting full information about the school reorganization bill will find this an excellent meeting to attend.

Kernels, Screenings and Chaff

By H. E. BABCOCK.

ALL MY LIFE whenever I have come face to face with a confusing situation I have followed a very simple rule for meeting it. The credit for this rule goes to M. C. Burritt, now Public Service Commissioner in the State of New York.

It was my good fortune to work with Burritt during the two or three years I was learning how to work. I owe him a great debt for the training he gave me through the example of his orderliness and his courage in attacking difficult problems even when no answer to them was apparent.

MY RULE

Today, as a farmer, there is precious little about which I can be sure. For example, dairy cattle are supposed to be increasing too rapidly in numbers and I own a lot of Guernsey heifers. Hogs are predicted to be on the down grade. Hatcheries are selling a great many more chicks than last spring.

In addition, there isn't a thing to which I or my men can turn our hands at farm work by which we can expect to earn as much per hour as people of equal capabilities outside farming. Under these circumstances, the only thing I can do is to bring into play the rule which has stood me in such good stead in the past. *My rule is to set down those things about which I am reasonably sure and by this process to creep up on the things about which I am not sure.*

THINGS I AM SURE ABOUT

As a farmer, I am sure about these things:

(1) That my real estate taxes cannot be permitted to go any higher *but must be reduced*;

(2) That I cannot afford to hire at

going rates carpenters, plumbers, paper hangers, plasterers, etc., *but that I must do this work with farm hands*, even though it is crudely done;

(3) That I cannot afford to use garages or shops of any kind for repairs to my automotive equipment and my other machinery; *these repairs have got to be made on the farm*;

(4) That I have not begun to scratch the surface in giving my family and the families of my men a living off the farm. With me this is more than the annual resolve to have a better garden; it goes further to include plenty of eggs, milk, meat, poultry and, if I can work it out, frozen meats, fruits, and vegetables during off seasons.

(5) That until price differentials change, the most profitable work to which I can put myself and my men *is the preparation of what we raise for market*. This means grading our own eggs, slaughtering the livestock we sell for meat, and possibly even hand-picking the dry beans we raise for market.

Boiled down to its essentials, the only thing I can be sure of is the soundness of a more self-sufficient farm which I won't permit to be taxed out of existence.

* * *

Just Around the Corner

This is March 9. It's snowing hard, but on every hand there are unmistakable signs of spring.

So, despite the snow and ice, I am reminded that last year we sowed most of our oats and barley and did all of our grass seeding in March; also that we turned out all of our livestock the last week in April.

With spring just around the corner it's interesting to review the winter

RAGS AND TATTERS: When we acquired a daughter-in-law in our family we also got a new saddle horse, Rags. Rags was bred to the five gaited stallion Highland Skylight and produced the filly, Tatters, shown in the picture. Just a glance at Tatters will show you that despite her name she carries the blood of a proud and spirited line.

and make a progress report to you folks who follow affairs at Sunny-gables with such friendly interest.

HEREFORD HEIFERS

Many of you are interested in the Hereford heifers. You have written me dozens of letters about them. They have wintered well in the open basement of one of the Larchmont barns. They have not eaten as much hay as I expected, but they seem to have grown very rapidly and are in fine condition. They average to weigh 440 pounds each when I bought them in Texas. I estimate that they average between six and seven hundred now. I have decided that they are too fine a lot of heifers to kill for beef, so we will either breed them ourselves or sell them to someone who wants a beef herd.

CROSSBRED PIGS

Our pig machinery clicked this winter. We have just finished selling thirty-four shoats and have thirty-five three-weeks old pigs to take their place, with two sows yet to be heard from. The pigs are all sired by a pure-bred Duroc boar we bought from the New York State College of Agriculture. Most of them are red with black spots, though a few are pure white. They are an exceptionally husky lot. We wintered the sows largely on grass silage.

CHICKENS

Because we sold off all our crossbred heavies in February we are down to six hundred laying hens—mostly Leghorns. We have fifteen hundred pullet chicks—Rocks, crossbreds, and Reds, which are from three to six weeks old and are coming fine. As soon as these fifteen hundred chicks are old enough to put on range—which will be about

May first—we will load our brooder houses with Leghorn chicks. We also plan on putting about fifteen hundred crossbred pullet chicks in them about the first of September.

LAMBS

All but a very few of our hothouse ewes have lambed and over a hundred lambs have been sent to market. This crop is clicking pretty well with our spring-lambing flock. Just as the last of the hothouse lambs are out of the way the hundred odd grade Shropshire ewes will begin dropping their lambs. We will get both lots sheared before this happens. We will then have three years' wool clip on hand.

* * *

Dumping a Truck

As more and more farmers become aware of the advantage of quickly unloading a truck, either by dumping it or some other device, they are becoming ingenious in working the problem out. For example, Robert K. Minard, Chester, New Jersey, contributes the following:

"When I was hauling hay from a farm three miles away, to save truck time I laid a stout rope on the truck floor with one end trailing perhaps 6 ft. The other end was thrown over the cab. The load was put on the truck and bound (I used no rear stakes). When I got home I simply hooked the two rope ends in a log chain hook anchored to a gate post and slid the load off directly under the hay fork. The truck then went back to the field. I also worked this stunt with green feed by the cow feed door and to drop ensilage corn by the cutter. Anchoring the chain just right dropped the load exactly where it was wanted without piling it up or tangling it at all. It was, of course, necessary to drive straight from the anchorage, or the rope would pull sideways off the front of the load."

For some time I have had the picture of the steer shown above lying on my desk, wondering whether or not to print it. The picture itself was supplied me by Charles Mitchell of New Berlin. It is said to have been made in 1874. When this picture was taken the steer is reputed to have been five years old; to have weighed 4,617 pounds, stood 21 hands high, and measured 25 feet from tip to tip. He was owned by Reuben Hinds of Edmeston, Otsego County, New York. The picture was made by W. G. Smith of Cooperstown, New York, and is owned by T. C. Hinds of New Berlin, Chenango County, New York.

Correspondence School Advertising

The Federal Trade Commission has ordered four correspondence schools to refrain from certain statements used in advertisements.

They have ordered the Public Office Preparation Corp., Kansas City, to stop claiming that it is connected with the United States Government and promising to get jobs for students who take its Civil Service course.

Other schools ordered to stop promising jobs to prospective students are: Southwestern Diesel Schools, Houston, Texas; L. L. Alcox Trade School, Portland, Oregon; Hemphill Diesel Schools, Glendale, Calif.; and the School of Diesel, Tulsa, Oklahoma.

* * *

There's a Reason

"I looked for the ad in your paper but did not find it, so I am writing to you for the information."

The ad to which our subscriber referred is a seed ad of a company which does not have a good reputation in the seed trade. It is important to remember that in the buying of seeds the cost per bushel is not the only thing to consider. Many times the cost per bushel of good seed that will grow is more than when the original cost is higher. Our subscriber is wise to inquire before he buys. The *American Agriculturist* scrutinizes advertisers very carefully before they are allowed in our columns and it helps also to say "I saw your ad in *American Agriculturist*" when writing them.

* * *

Switching Insurance

"My husband and I have insurance in the _____ Company. Recently an agent from another company called, saying that he could save us money if we took out a policy with his company. He talked so well about his insurance that it seems unbelievable. He is coming next week for his final answer."

Reliable insurance companies do not sanction attempts by agents to switch policy holders from one company to another. When you give up a policy upon which you have been paying for some time, you lose money. A clever agent may make the new policy sound better but we suggest that you let some impartial person, such as your local banker, analyze the policy, and if you do, we predict that you will not switch.

* * *

Best Gardens

We are receiving a flood of inquiries about the Best Gardens of St. Charles, Illinois. The offer of this company is that if you send to them six post cards addressed to friends, they will send you 25 bulbs and some flower seeds, and if the cards are sent within ten days you will have an opportunity to get a plush table cover. When the cards are sent, our subscribers tell us that they get a package containing seven small packets of seeds and a request for 29c to cover the cost of packing and mailing the table cover. A good many of our readers refuse to send this additional money, claiming that the offer was made free.

We have had quite a number of complaints from people who do not receive the seeds but when these were called to the attention of the company, the complaints have been handled.

* * *

Another Farm Racket Exposed

An ambitious scheme claimed to have victimized farmers and banks in central New York was nipped in the bud by Sheriff Nellis of Montgomery County when he recently arrested the ringleaders.

The method of operation was for one of the men to pose as a farmer with

a few cows on his farm. He would then buy additional cattle, giving a mortgage on his original herd and the new purchase. His partner would then sell most of the new lot for cash some distance away, while he repeated his buying and mortgaging activities. Fortunately, this endless chain of purchases, mortgages and sales had been in operation only a few weeks when squelched.

In addition to seven or eight Montgomery County farmers who were swindled, four banks became involved. The men arrested are being held for the grand jury on conspiracy charges, expected to keep them out of mischief for some time to come. The case is another reminder that time spent investigating chattel security is time well spent.—S. C. McGregor.

* * *

Don't Trifle With Eyes!

About a year ago the Post Office Department issued a fraud order against the "Natural Eyesight Institute" of Los Angeles, who advertised a system consisting of alleged eye exercises which they claimed would enable the user to get rid of the "spectacle handicap." A gadget called the "Natural Eye Normalizer" was included. The evidence submitted indicated that the treatment was useless and a fraud order was issued.

Recently the Service Bureau has received inquiries that similar claims are made by another concern. It seems to us evident that people with imperfect vision need spectacles for a wide variety of reasons. We do not see how any treatment can be prescribed until the person is examined by a person who is qualified to examine eyes. One's vision is too precious to trifle with.

* * *

Selling — Not Buying

"They have asked me to make dresses for them in my own home, paying from \$18 to \$30 per dozen. They furnish everything and pay all postage."

You have misread the letter sent you from the Quality Dress Company. It is true that the letter says "Making dresses and better made garments at home can net you from \$18. to \$30. per dozen." But if you will read their literature carefully, you will see they make no offer to pay you these sums or any sum. In fact, if you will study their proposition carefully, you will find that they are selling you materials and when the dresses are made, you have to find the buyers for them.

* * *

If any of our readers know the present address of Mr. Floyd Norton, formerly of Hamburg, New York, we would appreciate your sending the information to the Service Bureau, Box 367, Ithaca, New York.

NORTH AMERICAN ACCIDENT INSURANCE CO.

Oldest and Largest Exclusive Health and Accident Company in America

N.A. ASSOCIATES INC. AGENTS Poughkeepsie, N. Y.

Daniel Dean of Nichols, N. Y., is not only a leader in potato growing but a leader in potato marketing as well. He was one of the first to stress the importance of growing potatoes to meet consumers' standards of edibility.

Daniel Dean used 800 pounds per acre of G.L.F. 8-16-14 last year on more than thirty acres of potatoes which yielded better than 300 bushels to the acre. The varieties grown were Warbas, Green Mountain, and Smooth Rurals. His rotation for potato fields is: potatoes two years, followed one year by oats and one year by clover which is plowed down.

DANIEL DEAN

talks about Potatoes

More than 200,000 farms in New York, northern Pennsylvania, and New Jersey grow potatoes for market in some quantity or another. Success in growing this important crop depends on three things, according to Daniel Dean, first president of the New York Potato Association and past president of the Potato Association of America.

"Farmers must grow the varieties best suited to their respective areas, be willing to spray thoroughly and often, and use enough of a worthwhile fertilizer.

"I purchase fertilizer each year with four things in mind," continues Mr. Dean. "First the reputation of the manufacturer, second the concentration of the fertilizer, third the drillability of the mixture, and last but by no means least, the proven ability of the fertilizer to feed the plant all the way. I have found G.L.F. fertilizers satisfactory on all these points.

"Years ago I used to sit down in the spring with the State Fertilizer Analysis Bulletin to figure out which manufacturer best met his guarantees. I found many just 'skinned through.' Of late years I have not had to do this. G.L.F. fertilizers have pointed the way to better fertilizer values by carrying a liberal overage of plant foods above the guarantee.

Saves Farmers Thousands of Dollars

"I know that G.L.F. has been a leader in making higher analysis fertilizers available to farmers. This move has resulted in saving farmers many thousands of dollars. As long ago as 1909 I came to the conclusion that I would save time, money, and labor by using double strength fertilizers, and I have purchased nothing else since whenever I could buy them. G.L.F. has been successful in improving the drillable condition of its mixtures and applying up-to-the-minute knowledge to fertilizers so that they do a good job of feeding the growing crop.

"These things are as they should be," concludes Mr. Dean. "Because I expect a

farmers' cooperative to set the pace for all industry in putting dollar value into the materials the farmer has to buy in carrying on his business."

In this Corner

BUSY FARMER—

John Schoonmaker of Accord, N. Y., keeps a dairy herd of between 40 and 50 cows, a flock of 1500 chickens, and raises 150 acres of sweet corn, 100 acres of cabbage, and 5 acres of cucumbers, beets, carrots, lettuce, and tomatoes. And he still finds time to be active in several farm organizations. He tells about his plans for 1939 in the G.L.F. PATRON which the mail man will leave in your box soon. Thirty-nine other farmers give their views and opinions in this same issue. Watch for it.

WAR AND FEED BAGS — With European nations using millions of burlap sand bags, the burlap market has jumped \$10 a thousand. G.L.F. bag costs will not increase for the present, because of a fair supply

of bags on hand. Patrons can make this supply of bags last longer and put off paying higher prices by caring for bags properly and returning them in good condition. This easy-to-make bag rack will help keep feed bags in good condition.

WORLD'S FAIR COW —

Either *Bridget of Atwood Orchards*, shown here, or her full sister, *Cleopatra's Lass*, will be shown at the New York World's Fair this summer.

Both cows are owned by J. L. Atwood of Plattsburg, N. Y., and both have made records on G.L.F. feeds. Last year Bridget produced 16641 lbs. milk and 670.45 lbs. butterfat in 305 days, winning third place on the Roll of Honor.

• • •
A birdseye view of the crowd
at the auction.

This is the fine brick house
on the farm which was sold.

FIRST AND LAST for one reason or another, I have crossed eastern Pennsylvania quite a good many times and always I think with a growing appreciation of the fact that the so-called Pennsylvania-Dutchman is typically a most outstanding, good farmer. I know that I have never written at any length concerning these people, although from time to time I have casually commented upon their straight corn rows and absence of fence rows and I have mentioned their "over-hang" barns and their big, generous two and one-half story brick houses. The impression made upon me has grown until just as September faded into October, I went down into this country for a few days in order that I might meet these folks face to face upon their own land and in their homes. I went specifically that I might write concerning them for the information and perhaps the amazement of some of my friends in the *American Agriculturist* family. I can only say that what I saw and heard was beyond my expectations.

These Germans are old residents in the New World. Soon after 1700 they began to set their

ery is the most German of any New York County. Our influx was small however, as compared to Pennsylvania where the Quaker, William Penn, offered them a welcome and land and full political and religious freedom. Hither they came in numbers so large as to entirely dominate the social and religious life of their communities. Southeastern Pennsylvania, or a little more exactly, the region lying between the Susquehanna and the Delaware Rivers, constitutes the heart of Penn-Dutchland, but it overflows into other adjacent regions. Southwest of Harrisburg is the splendidly fertile Cumberland Valley and here Pennsylvania Dutch farming is everywhere in evidence. A little further south in Maryland, the lovely Monocacy Valley, where storied Old Frederic basks among the fat farms, is in reality only an extension of the German influence. Even further down in Virginia, the northern part of the Shenandoah Valley, famous as the "grainery of the Confederacy", deserved this title by virtue of its limestone soil and its German farmers.

Before I went I talked with men who knew

faces toward America and we here in New York received a considerable number of them as the family names and Lutheran churches of the Hudson, Mohawk and Schoharie Valleys still attest. I think Montgom-

the state intimately and the tenor of their advice was this: "If you wish to see the Pennsylvania-Dutch farmer at his best, uncontaminated and undefiled, go down into Lancaster County. There is no other place as good."

Lancaster County is a southeastern County of Pennsylvania. It runs to the Maryland line and the part of which I write lies hardly sixty miles from Philadelphia. The topography of most of the county is ideal. There is hardly anything that can be called a high, steep hill and on the other hand there are almost no large areas of dead level. Raised in what would be called a hilly country, my agricultural soul instinctively cries out against a perfectly flat land. In Lancaster County modern agricultural machinery can go almost anywhere and at the same time there are no problems of difficult drainage. Geologically and in contour the region might suggest the famous Blue Grass of Kentucky. It goes almost without saying that it is a limestone country which might easily give me an opportunity to launch out upon my favorite theme concerning the unrivaled advantages of limestone soil.

Another great advantage is that this region enjoys a very much kindlier climate than does New York. Situated almost at sea level and just north of the Maryland line, spring comes earlier and autumn lingers longer than with us, while winter lacks the lusty presence that it has on the higher lands of the New York Milk Shed. All my life I have watched the corn crop anxiously and any time after September 10th, I have wondered if frost would soon catch the crop. In Lancaster County on October first, there had been (Turn to Page 23)

Firestone

DEMONSTRATION PLAN

With Your Own Tractor on Your Own Farm You Can See For Yourself How Much Time and Money You Can Save with FIRESTONE GROUND GRIP TIRES

FIRESTONE invites you to TRY before you buy! So confident are we of the superior performance and economy of Firestone Ground Grip Tires, that every farmer is welcome to make his own time and fuel tests. By means of the Firestone Demonstration Plan you can now prove to yourself in dollars and cents—right on your own farm—without cost or obligation—how much *extra profit* you can make with Firestone Ground Grip Tires.

And when you have seen for yourself, how much time, work and money you can save with Firestone Ground Grip Tires, you can change over your present steel-wheeled tractor quickly and at low cost by means of the Firestone Wheel Changeover Plan. Tell your nearby Implement Dealer, Firestone Tire Dealer or Firestone Auto Supply and Service Store today that you want a free demonstration. Get the details of the Firestone Wheel Changeover Plan and also ask about the Firestone Special Farm Payment Plan, by which you can enjoy the comfort and economy of Firestone Ground Grip Tires and pay for them on easy terms, arranged to meet your convenience. And when you place your order for a new tractor or any wheeled farm implement, insist that it be equipped with Firestone Ground Grip Tires.

For greatest economy in your farm operations, find out today how little it costs to put *your* farm on rubber.

Listen to The Firestone Voice of The Farm—Everett Mitchell interviews a Champion Farmer each week during noon hour. See local paper for station and time. Also Listen to The Voice of Firestone with Richard Crooks, Margaret Speaks and Alfred Wallenstein, Monday evenings over Nationwide N. B. C. Red Network.

See Firestone Tires made in the Firestone Factory and Exhibition Building at the New York World's Fair. Also visit the Firestone Exhibit at the Golden Gate International Exposition at San Francisco.

MAIL THIS COUPON TODAY !

Firestone BATTERIES

For a quicker start and more of them, be sure your new battery is a Firestone. Ask about the Firestone Battery Changeover Plan.

Firestone SPARK PLUGS

Get better performance, quicker starts and greater economy from your car or truck by installing a set of Firestone Spark Plugs.

Only FIRESTONE Ground Grip Tires Have These Patented and Exclusive Advantages:

Triple-Braced Traction Bars, which cannot bend, break or tear off. **Longer Tire Life**, because of the patented Firestone Gum-Dipping process. **Tread Guaranteed Not to Loosen**, because of extra layers of Gum-Dipped cords under the tread.

Scientifically-Spaced Traction Bars provide better cleaning.

52 to 89 Extra Inches of Traction Bar Length give greater traction.

32% Greater Tread Bar Surface Contact assures increased pulling power.

21% Flatter Triple-Braced Tread provides shoulder traction.

Continuous Triple-Braced Traction Bars, joined together for smoother riding.

The Firestone Tire & Rubber Company, Akron, Ohio

Gentlemen:

Without obligation on my part, please send me (check below):

- ☐ A copy of the new 1939 Firestone Farm Guide Book.
- ☐ Information about the Firestone Special Farm Payment Plan.
- ☐ Full details of the Firestone Cut-Down Wheel Plan.
- ☐ Please demonstrate the performance and economy of Firestone Ground Grip Tires with my own tractor on my own farm.

Firestone CONVOY TIRES

FOR CARS, TRUCKS AND SCHOOL BUSES

The Firestone Convoy Tire carries a Lifetime Guarantee. It delivers long, safe mileage on rural roads at low cost per mile. This high quality, long mileage tire is Triple-Safe against the dangers of blowouts, punctures and skidding.

CHARLES M. GARDNER

Editor of the National Grange Monthly and High Priest of Demeter of the National Grange.

A GREAT EVENT ahead in New Jersey, in which Grange members and many others will heartily join, is to be the golden wedding celebration of State Master and Mrs. David H. Agans, which is scheduled for Monday evening, July 3, and for which the Patrons of that state are making elaborate preparations. Mr. Agans has led the Grange work of New Jersey for nearly a score of years, has been prominently identified with public life all that time, has served in the New Jersey State Senate and still holds several responsible appointive positions in the affairs of his community and the state.

THE ANNUAL state-wide Church-Grange service in Connecticut is scheduled for Sunday morning, May 21, to be held as usual at the State College in Storrs. This event draws Grange members from nearly every township in Connecticut, with an attendance which has several times exceeded 3,000 people.

RARELY has such widespread sorrow come to the Grange as the sudden death of Hon. Robert P. Robinson of Wilmington, Delaware, treasurer of the National Grange for the past 16 years. He was one of the most conspicuous figures in National Grange life, had been Governor of Delaware for four years, had spent his entire lifetime in the bank of which he was president, and his contribution to the progress of the Grange was of exceptional character.

AT SYRACUSE, N. Y., the recent state-wide conference of Grange lecturers brought nearly 400 workers together, continued three busy days and generated unlimited enthusiasm. It was directed by Mrs. Stella F. Miller, New York State Lecturer. Many new plans and projects were evolved.

IN FULL SWING is the annual state-wide dramatic contest among the Granges of Rhode Island. The local units are taking hold in enthusiastic fashion. Cash prizes of \$25, \$15 and \$10 are offered, and county play-offs will be followed by state finals at some centrally located Grange hall.

CATAMOUNT Grange in New Hampshire has a unique custom—its flag ceremony being conducted at each meeting entirely by the members of one family, who this year hold the offices of Ceres, assistant steward and lady assistant steward. All are very proficient and make the ceremony each meeting night exceedingly impressive.

IN CONNECTICUT Charles H. Curtis of Plainville has been named as treasurer of the State Grange, to fill the vacancy caused by the sudden death of Darius A. St. John of New Canaan. Mr. Curtis is one of the prominent Patrons of the state, is already treasurer of the State Grange Educational Aid Fund and is a past master of both subordinate and Pomona Granges. Mr. St. John had held the position of state treasurer for nearly a score of years and during most

FIRESTONE PUT THE FARM ON RUBBER

"We Retreat but Never Surrender"

—Say Dairymen

"MILK PRODUCERS failed by 2 per cent to secure voluntary contracts from dealers handling 90 per cent of the milk going into the metropolitan market!"

"The United States Department of Agriculture on March 14 announced a suspension of the marketing program in the metropolitan area, pending outcome of an appeal to the United States Supreme Court of Judge Cooper's decision!"

"On March 18 the New York City price of grade B milk dropped 2½¢ from 13¼¢ to 11½¢. City papers estimated that this would save New York City consumers (and cost dairymen) \$100,000 a day!"

Thus in brief headlines can the story of recent developments in milk marketing be told, a story which will result in millions of dollars of lost income to dairymen.

On March 17 some 2,000 dairymen gathered at Syracuse to hear that story in detail and to answer the question, "What shall we do now?"

"Never," said one speaker, "have I seen dealers use more despicable tactics than they have in recent weeks."

In several cases dealers stated that if milk was diverted from them, they would never pay for milk purchased during the previous month. Admitting that it was a just debt, they practically said, "but try and get it!" Like a famous admiral, some dairymen said, "Damn the torpedoes! Full speed ahead!" In some instances dealers had producers so tied up with ironclad contracts that the producers' own lawyers agreed it would be illegal if producers failed to deliver milk.

Much indignation was expressed because several subsidiaries of one big dealer failed to sign voluntary contracts, while other subsidiaries did sign. Speakers charged that those who *did* sign furnished milk to those who *did not*, thus helping to defeat the attempts of dairymen to get a living price for milk.

Said A. C. Pilger of Batavia, "In the Buffalo market we had worked things out fairly satisfactorily, but I do not see how we can continue to have \$2.00 milk in Buffalo and \$1.00 milk in New York City."

Bitter though the set-back was, dairymen at Syracuse kept their heads. They believe the situation is temporary, and calmly considered what steps to take to make the period of low prices as short as possible. There was a minimum of strike talk—most dairymen agreeing that a general strike could not be successful at this time.

"The thing to do now," said one speaker, "is to go back home and

strengthen our fences. Then if, in a month or two, the Supreme Court reverses Judge Cooper's decision, we can demand 100 per cent compliance by dealers. If the Supreme Court does not reverse the decision, we will, after the flush season is over, put on another drive for voluntary contracts, and next time *we will win*."

Two important gains have resulted from the attempt to continue the marketing agreement voluntarily. The first gain is that never before in the history of the New York milk shed have dairymen been so united in any program. *Let's keep that advantage!*

The second gain made is the development of new leaders. Several "wheel horses", who have been in the dairy marketing fight for years, mentioned with enthusiasm the way the younger boys came to the front and worked untiringly to put the voluntary contract idea over. That new leadership will count in months to come.

Adopted at the meeting was a resolution that recommended tightening up on the licensing and bonding of all milk dealers. Producers can support that resolution wholeheartedly. No dealer should have his bond renewed so long as he owes dairymen money for milk. No dealer who has not secured a license and taken out a bond should be allowed to continue in business, and the amount of bond should be sufficient to pay farmers for all of the milk that dealer purchases.

As indications of the attitude of dairymen, several statements made at the Syracuse meeting were interesting. For example, one speaker said:

"Perhaps we are better off than had the voluntary compliance program gone through. A small group of dealers might have discredited the whole idea by preventing its working out successfully. Perhaps the sooner we get 80¢ milk, the sooner we will get \$2.00 milk again."

Most hopeful from a long-time view is the harmony that has developed. Said another speaker at Syracuse:

"In the past I have cursed the League, but I want to apologize now and to say that in this fight they have been absolutely 100 per cent."

Someone in the audience sent a note to Chairman Rogers requesting a word from Fred Sexauer. Fred made an extemporaneous but stirring appeal for unity of action, indicating that no matter what might arise, he would not again be a party to quarrels between groups of dairymen. He said:

"I have called some men unpleasant names, and they have returned the compliment. Recently I have met some of them and have found that there are a lot of things on which we can agree. From now on, groups of dairymen should concentrate on those things on which they can agree and minimize their differences."

"In analyzing 20 years of disagreement between dairymen," continued Mr. Sexauer, "I can trace most of the trouble to dealers. They are happiest when producer organizations discuss each other's faults rather than virtues."

The anti-farm gang, made up of some milk dealers, some lawyers, and the publisher of a farm paper, have won the first skirmish. If, as much of the propaganda against the marketing order indicated, dairymen would now get *more*—not less—for their milk, the temporary set-back could be taken with more grace. But farmers will not get *more* for their milk. Predictions are

You naturally expect
HIGHER YIELDS
and
BIGGER PROFITS
when you fertilize your crop

It's important, therefore, that you use
fertilizers that give top performance and still
are low-cost sources of plant food...

THE State Experiment Stations and the United States Department of Agriculture have conducted many tests to find out what properties the various plant foods should have to be most effective in increasing crop yields and profits. These tests, made on a great variety of crops and soils, show that...

NITROGEN

the important growth element, should be

1. Completely available
2. Resistant to loss by leaching
3. Low in equivalent acidity

Du Pont UREA NITROGEN meets all these requirements, and is one of the low-cost sources of nitrogen in fertilizers. Many high-grade fertilizers now being sold in New York and New England contain Du Pont UREA NITROGEN, the completely available, soluble, leaching-resistant source. Results from the use of these high-grade goods have been uniformly satisfactory. We urge you to investigate. Once you know about the many good qualities of Du Pont UREA NITROGEN, you will see that all your fertilizers contain it. Write for leaflet "Quality Nitrogen in Fertilizers."

Who Defeated the Milk Marketing Agreement?

DAIRYMEN of the New York milk shed know that the heroic attempt to carry out the provisions of the milk order on a voluntary basis failed by only 2%. Dealers who signed the voluntary contract insisted that it would not be valid until at least 90 per cent of the milk was signed up. When the deadline came on Tuesday, March 14, only 88% of the milk was signed on the voluntary basis, so the whole plan was declared off.

At this writing every dealer is setting his own price, all prices are on the toboggan slide, and again dairymen face the same ruinous old situation with prospects of milk from 50 to 75 cents by June.

The milk marketing plan, for the few months it was in operation since last September, put millions of additional dollars into dairymen's pockets. Milk prices ranged above those of practically everything else which the farmer had to sell. One dairyman said to me since the order was declared unconstitutional:

"It is the first time in years that milk prices have been such that I have been able to catch up and break even. And now look what we are up against again!"

Hundreds of letters have rolled into *American Agriculturist* offices in recent weeks in support of the Rogers-Allen bill, and the milk marketing plan.

But the plan has failed at least temporarily, and for just one reason, the same one why every other constructive effort to solve the milk marketing problem has been hamstrung for the last fifty years. *The failure was due to the work of the anti-farm gang, consisting of a few milk dealers, a few lawyers, a few politicians, and one or two publishers.* I have no word of criticism of any farmer in the milk shed who refused to go along with this order. If I were dairying again and was subjected to the constant stream of propaganda from this anti-farm gang, I would have no confidence in anybody nor in any plan. No, you should be careful not to condemn your neighbor. Put the responsibility for this calamity right where it belongs, and that is on this gang, which has fattened on the sorrows and misfortunes of the dairy farmer for as long as any of us can remember.

When are we going to stop supporting them and believing them, instead of our neighbors and our friends? When we do, there will be a different story to tell in the milk business.

In the meantime, the situation is not all black. The same plan is working in New England and bringing fair prices. No plan has ever had the support that this did, farmers have learned to work together, they are determined as they never were before, and while they have lost the present battle temporarily, they will win the war. For a fuller account of what has happened up to the time of our going to press, see Page 3.

Duck Farmers Fight Unfair Labor Ruling

THE RECENT ruling by the New York Department of Labor, requiring duck farmers on Long Island to pay the unemployment insurance tax on their farm laborers, is unfair and unreasonable. The State Department of Labor makes the absurd ruling that duck farmers do not till the soil, therefore they are not farmers in the meaning of the law and are not exempt from the payment of this unemployment insurance tax.

The seriousness of this ruling is shown by the fact that if enforced it will cost the duck farmers of Long Island \$30,000 in back taxes and interest, and will force them to contribute \$10,000 per year to this tax. Unless the collection of this tax can be prevented, it well-nigh spells ruin to a great farm industry.

The ruling is also important because it is easy to see that if duck farmers are made to pay this tax, it will be only a short time before similar demands will be made on dairy farmers, potato farmers, and others.

American Agriculturist has called attention repeatedly during the past year to the unfair and partial decisions and rulings of the National Labor Relations Board supporting radical labor organizations in putting the costs and burdens of additional labor regulations on to agriculture. This decision made by the State Department of Labor on the technicality that duck farmers are not real farmers is in line with similar decisions made by the National Labor Relations Board.

Long Island farmers are preparing to fight this ruling, and their fight is every farmer's fight.

A bill has been introduced into the Legislature by Assemblyman E. R. Lupton, which provides among other things:

That the term farm laborer shall include any person employed on any kind of a farm in connection with the planting, cultivation and harvesting of any farm product, the raising, feeding and growing of livestock, bees, poultry, including all domesticated birds or fowls, dairying in all of its branches, forestry or lumbering in connection with the conduct or management of a farm, the processing, packaging, transporting and marketing of all products of the farm.

It is earnestly suggested that you write immediately to Assemblyman E. R. Lupton, Assembly Chamber, Albany, and to Governor Herbert H. Lehman, Executive Chamber, Albany, in support of the principles of this bill.

The First Sign of Spring

YESTERDAY I saw a maple grove with bright shining sap buckets on all the trees, and I knew that spring was here.

We used to make lots of sirup and sugar on the old farm, and the newly tapped trees always carry me back to the first hurrying days of spring when there was a big sap run. Freezing nights and bright, warm days started the fun and got us going on the first outdoor operation of the year.

Maybe it would not be so much fun now, but I wouldn't take a lot for the memories of those long evenings, which sometimes lasted all night, when we fed the wood to the blazing fires under the boiling pans, and when maybe the neighbor boys gathered with eggs in their pockets to cook in the boiling sap. We used to think that eggs cooked this way were sweeter if we could succeed in getting them out of the pans. Maybe they just tasted that way because they were usually sneaked out of the "butt'ry" when Ma wasn't looking!

The Best Way to Travel

"We are all having a wonderful time. When your telegram brought greetings, a cheer of 100 voices was the response."—G. H. S.

THAT NICE message came from one of the members of the *American Agriculturist* Tour, just back from three wonderful weeks to California and the Golden Gate Exposition. Reservations for this trip came pouring in so fast

that we were obliged to limit the party to 100 and were unable to accept the last applications. The folks who went are unanimous that the trip was all we promised and more.

I have often said that could people know before going on one of the *American Agriculturist* tours of the things we do to make the trips successful, we would always have many more applications than we could accommodate.

Now, the same will hold true for this great European tour which we are organizing from July 28 to August 24. Already there are hundreds of inquiries, and we are beginning to get reservations. You never will have an opportunity to see so much of Europe under such fine conditions, and at such a reasonable cost as this tour will give you. All the burden and worry of travel is eliminated. You will have just one thing to do, and that is to have a good time.

For full information, see Page 5 of last issue of *American Agriculturist*, and write E. R. Eastman, Savings Bank Building, Ithaca, New York, for itinerary and full description of the trip.

Why Folks Eat Western Apples

APPLÉ growers of the State of Washington are carrying on an attractive national campaign to get people to eat western apples. One of these ads states that apples:

1. Fight winter germs.
2. Aid good digestion.
3. Keep blood alkaline.
4. Furnish necessary minerals.
5. Contain necessary vitamins A and C.

"We Washington, people", the ad continues, "teach our children a health habit we call the Apple Hour. On the table at night we have a big bowl of Winesaps, Yellow Newtons or Delicious. Big-folks and little all reach for at least one apple. Why don't you start a bed-time apple hour in your family? We think you will find it pays. Grocers are featuring crisp, juicy Washington State apples right now."

That one ad cost Washington apple producers thousands of dollars. I repeat it here now free of charge for two purposes: First, what it says about the food and health value of apples is correct; second, it shows why western apples, even though not of such good quality as those grown in the Northeast, are in far greater demand by consumers.

Isn't it about time that Northeastern apple industry did more effective work to get its rightful place in the sun?

Those New Neighbors

EARLY spring is moving time in many farm neighborhoods. In your own there are strangers who need some friendly attention. Have you dropped around to tell them that you are glad to have them in your neighborhood? Or how about a get-acquainted party? New maple sirup and sugar are available now. A good old-fashioned sugaring-off is a lot of fun.

Eastman's Chestnut

SOMEONE was telling me the other day about a lady who is treasurer of the Ladies Aid Society in her town, and who went into a bank to deposit the organization's funds. To the bank teller, who was a little hard of hearing, she said that it was "the aid money."

The teller thought she said "egg money", and, in order to be courteous, tried to hand her a compliment.

"Remarkable, isn't it", he said, "how well the old hens are doing these days!"

The Answers to the Questions

LAST FALL when we announced that we were going to have an American Agriculturist Cooking School, we didn't realize how much extra work we were letting ourselves in for. By the time the number of enrollments shot about the thousand mark, and examination papers and letters came rolling in—over a thousand of them every two weeks—we faced the fact that the Cooking School was one of our biggest jobs while it lasted.

Now the end is in sight, and we are keeping our promise to print correct answers to questions asked in connection with each lesson. This is a huge undertaking, also, as it means taking several pages of space in this issue of *American Agriculturist*. However, we feel that it is well worth while, for this material plus the original twelve lessons gives you a course in cookery which is so concise and so complete that it may be called "Cooking in a Nutshell." One of our contestants wrote us last week that the lessons had been so helpful to her that she intends to save all of them to pass on to her little daughter. We like to think that thousands of *American Agriculturist* readers feel the same way about our Cooking School.

LESSON I—CAKE

1—How are cakes classified?

Sponge and butter cakes.

2—What makes butter cakes rise? Sponge cakes? Pound cakes?

Butter cakes rise by air beaten into the mixture or incorporated into egg whites beaten separately and folded in; and by gas formed by the action of baking powder and a liquid, or by soda and an acid such as sour milk or vinegar. Sponge cakes rise because of expanding air beaten into the mixture or into separated egg whites. Pound cakes rise solely because of air beaten into the mixture.

3—Which method of mixing gives best texture in a butter cake?

Cream butter thoroughly, blend in sugar; then add egg yolks well beaten; sift dry ingredients and add alternately with the milk; fold in beaten egg whites.

4—If you add chocolate to the foundation cake recipe, what other ingredients are decreased? Why?

Flour, because chocolate stiffens a mixture upon cooking. Fat, because chocolate contains fat.

5—If you make a gold cake, substituting egg yolks for whole eggs, what other changes are necessary?

Use more flour or decrease the liquid as the batter must be thicker.

6—Which class of cakes would you recommend for children and elderly people? Why?

Sponge. Because of less fat they are more easily digested.

7—Why is acid used in sponge cakes? Acid toughens egg whites and keeps them from going back to their natural watery state.

8—Why is soft wheat flour to be preferred for cakes?

Soft wheat flour contains less gluten and therefore gives a more delicate texture.

9—Give proper temperatures for baking butter cake (loaf); butter cake (layer); sponge cake (loaf); sponge cake (layer).

Butter cake loaf 350° F.—50 to 60 min.

in the

by

Mrs. Grace Watkins Hockett

LESSON II—FROSTINGS

1—How would you classify frostings?

Cooked and uncooked.

2—What are the two most important stages in the making of boiled frostings?

To determine when the syrup is sufficiently cooked and when to stop beating after the syrup has been poured over the beaten whites.

3—How can you tell when the syrup is ready to use? Or when the frosting is beaten enough?

For dense, sweet icing, the syrup should reach 238° F. on candy thermometer, or spin a long thread, form a soft ball in cold water, and form low, even-sized bubbles when cooking. For fluffy icing, 244° F., the hard-ball stage, should be reached. Frosting is beaten enough when it will spread without running and yet will hold its shape.

4—What harmless ingredients when boiled with the syrup make a smoother frosting? Why?

Corn syrup or cream of tartar helps to change the sugar into levulose; this will not crystallize, thus preventing grains.

5—On what kind of cake would you put a Lady Baltimore filling?

On a plain yellow or white cake, that is, no nuts or fruit in the batter.

6—What is the difference between a filling, a frosting and an icing?

A frosting and an icing are the same; a filling may be a sort of custard mixture or jelly, fruit or even melted marshmallows and is used between layers, not on the outside.

7—Which should be iced first, the sides or the top of the cake?

The sides of the cake should be iced first to help hold the top icing in position.

8—If your icing is too sticky, how can you make it stiffen (2 ways)?

Either set the bowl over boiling water and cook a little longer or mix in enough sifted confectioners' sugar to make it of the right consistency to spread.

9—If too hard, how would you soften it? A few drops of hot water will soften icing.

10—How does a butter frosting differ from a hard sauce?

It is chiefly a difference in amount of sugar added. A butter frosting is soft enough to spread, whereas a hard sauce will stand alone.

LESSON III—BEVERAGES

1—What is stimulating in coffee, tea and cocoa?

Caffeine is the stimulant in coffee, tea and cocoa. It is known as theine in tea and theobromine in cocoa.

2—What gives the bitter taste to tea and coffee if steeped too long?

Tannin.

3—Which is more important, the grade of coffee, or the way you make it? The blend or the grind?

The way you make it.

The grind, because upon the fineness

of the grounds will depend the amount of surface exposed to the water.

4—What is the better way to make your coffee stronger?

Use more coffee, rather than to boil it longer, since long boiling draws out undesirable flavors.

5—What effect has the pot upon tea or coffee?

Vitreous ware such as glass, earthenware or enamel does not impart to coffee the metallic taste which is apt to come from metal.

6—Why is black tea said to be easier on the nerves than green tea?

Because of less tannin contained in black tea, the digestion is less disturbed by it. This may react indirectly on one's nerves. There is little difference actually in the theine contained in black and green tea.

7—Does the term Orange Pekoe have anything to do with the flavor of the tea?

The term "Orange Pekoe" denotes the part of the tea plant from which leaves are picked, and does not mean that the tea has an orange flavor.

8—How would you store tea and coffee?

Tea and coffee should be stored in clean airtight containers, glass or bright tin. A cool, dry place is an additional advantage.

9—What is the difference between chocolate and cocoa?

Chocolate is made from the inside of the cocoa bean which has been ground and pressed into a cake. After much of the fat is removed from these cakes, the remaining product may be pulverized into cocoa.

10—Why is cocoa the most nourishing of the three beverages?

Hot cocoa is more nourishing than tea or coffee because of the milk used in

making it. Its fat content also adds to its fuel value.

LESSON IV—VEGETABLES

1—Give 2 examples of each of the different parts of plants used as food.

(a) Roots and tubers: turnips, carrots, potatoes, sweetpotatoes, onions, beets and parsnips.

(b) Stalks or stems: celery, chard, rhubarb, asparagus, broccoli.

(c) Leaves: All kinds of greens—spinach, dandelion, beet tops, lettuce, cabbage, Brussels sprouts, kale.

(d) Flower heads: Cauliflower, broccoli.

(e) Fruits, seeds or seedpods: Peppers, tomatoes, okra, squash, pumpkin, beans, peas, lentils, corn.

2—Why scrape vegetable instead of paring?

Scraping removes less of the minerals which often lie just under the skin.

3—What reasons do you see for including here a recipe for boiled dinner?

The boiled dinner offers a complete dinner course, is well balanced as to flavor, appearance and food values. It also shows good management, because it requires fewer cooking and serving dishes.

4—What would you add to it to make a complete meal?

Bread and butter, a beverage and a dessert (gingerbread perhaps) would complete the meal.

5—What is the advantage of milk instead of water in the recipe for baked carrots? Of having the carrots unpared? Milk adds flavor, vitamins and mineral salts to the dish. The carrots are left unpared in order not to lose any of the mineral salts.

6—Name 5 vegetables rich in starch. Potatoes, sweetpotatoes, corn, beans, peas, pumpkins, squashes, carrots and beets.

7—Why are baked potato and greens perfect with a steak or roast?

The potato has an alkaline reaction in the body which counteracts the acid reaction of the meat. The greens add color and mineral salts without being heavy. Contrast in texture of foods lends interest.

8—What is necessary to add to the recipe for lima beans with bacon to balance the meal properly?

Either a succulent vegetable, leafy or fruit salad or fruit dessert, beverage and bread and butter should be included.

9—Why crisp your vegetables by wrapping them in a damp cloth rather than soaking in water?

There is less loss of minerals and sugar.

10—What is the best way to cook onions to save their minerals and vitamins, as well as give good flavor?

By baking.

LESSON V—THANKSGIVING DINNER

1—From what you have learned about food values of vegetables and from the menu-making hints given here, which dishes on the optional menu would you use for Thanksgiving dinner consisting of fruit juice, roast poultry, stuffing, gravy and a relish, rolls and butter, potatoes and 2 other vegetables, salad, dessert, beverage, nuts?

Possible good combinations from optional menu:

I.
Tomato juice, turkey, stuffing, gravy, cranberry sauce, warm rolls and butter, scalloped onions, baked potatoes and steamed squash, molded carrot salad, mince or apple pie (applesauce)
(Continued on Page 20)

GET GREENER LEAFIER HAY

**CUT TIME AND COSTS
WITH THESE
MODERN MACHINES**

Make air-conditioned hay with Case Oil-Bath Side Delivery Rake. It builds higher, narrower, fluffier windrows with leaves inside, guarded from bleaching and shattering. Only one pair of gears; they run in oil-bath.

Feeding value of hay is measured by its bright green color and by the amount of leaves . . . just as is the price of market hay. For leaves and color are the signs of protein, vitamins and digestible nutrients that produce milk and promote rapid growth. Get greener, leafier hay by cutting, curing, and taking it up quicker with these modern machines. Reduce risk of rain damage from sudden showers; reduce leaf loss and bleaching by air-conditioned curing.

See your Case dealer now. See how you can make better hay and save it more surely. See how you can save time, labor and money in your haying. Be sure to mail the coupon.

Garden Gossip

By PAUL WORK

Overdoing Sweet Corn

IN THE course of 9 days extension touring in the eastern part of the state, one of the principal topics of discussion was sweet corn. Not only in the Hudson Valley and on Long Island was it apparent that planting is being expanded, but we hear that in the Madison-Chenango territory as well as in Western New York, acreage is on the up.

For many years, the price of sweet corn in mid-summer has been extremely low. There is a period, in most regions about the last of July or the first two weeks of August, when both corn ear worm and corn borer injury are at a minimum. Unfortunately, however, this is a time of very low prices.

As with most crops, there is room on our markets for good sweet corn and the people who have been at it for a number of years are looking into matters of improved packaging, precooling and other measures to get it to the housewife with quality at its best. The outlook for those who do a merely ordinary job is not too hopeful.

* * *

A Living from the Garden

NOBODY knows what milk will be worth this summer. Everybody hopes the milk situation will improve and the picture is not all dark. Anyway there is one crop that has never failed yet. Even in the most unfavorable gardening years, the vegetable patch has yielded a lot of good food and there have, every year, been people around the table to eat it without argument about the price. Things pulled from the garden definitely reduce the amount of food that must be bought for cash money. Cash money is what we have left after the many distributing costs have been deducted. There are no deductions from what we carry in from the garden and even the labor costs are low in proportion to what we get out of it.

To get the maximum value out of the garden plot, it must be started early. It ought to have been plowed in the fall, ready to harrow just as soon as the snow disappears and soil is sufficiently dried out. If it was not plowed last fall, get a big red pencil and make a big red mark on the calendar next October so that this job will not be overlooked.

If the garden has not yet been plow-

ed, do not miss a chance to do it. Possibly, it would be worth while to even steal an hour from the oats. Another possibility is to spade a little strip even 5 feet by 25 feet for an early planting of the smaller things. Here are seven sisters among the countless vegetable crops to start very early; seed may be sowed of radish, spinach, lettuce, beets, and carrots. Seed or plants or both of beets and lettuce may be put in along with onion sets and well-hardened cabbage plants may be put out very early. Then, where a little more ground is available, the early planting of peas may be made. Sow all at once or only a little while apart, an early variety like Laxton Progress, a mid-season one like Gilbo or Morse Market, a late one like Alderman and a very late one like Stratagem to give a fairly complete succession. Of course, there are other varieties that may be substituted for these various maturity stages.

Now we have a glorious start for the early garden. The next thing is to make plantings from time to time — say every three or four weeks until the first of August and one may have all the vegetables that can be used in wide variety clear up to Thanksgiving, and with storage in cellar or pit plus glass jars in the cellar the garden will be yielding from mid-May of one year to mid-May of the next.

* * *

Interstate Barriers

EARLY April is to see a conference in Chicago on the subject of interstate barriers which interfere with freedom of trade in agricultural products among the different parts of the country.

The past few years have seen a marked tendency for interests within a given state to attempt to protect their own markets by making it difficult for people from other states to sell their goods within their bounds. These restrictions take almost countless forms: license fees; truck taxes; quarantine restrictions; sanitary regulations. Sometimes it is pretty difficult to tell where reasonable taxations in return for use and reasonable quarantines end and where protective tariff begins.

Vegetable men are very much interested in this proposition. Our vegetable growers in New York have several times expressed themselves as against undue restrictions.

G. A. Piquet of Central Square, N. Y., believes in plowing his garden early. George Bradshaw is driving the team.

...Supplies an abundance of Flavin, important Growth Factor!

IT'S A SAFE GUESS that thousands of chicks every year fail to grow and develop properly because of lack of vitamin G (flavin) in their feed. Vitamin G (flavin) is absolutely necessary for growth. Without it there can be no growth. Feeding tests for several years have shown that some of the ingredients ordinarily used in starting feeds vary greatly in their flavin content.

Today, Purina has found a new way to increase the amount of flavin in Startena. A new exclusive flavin concentrate, PURI-FLAVE, is now being added to

every bag of Purina Startena. This guards against a deficiency of this important growth factor.

Puri-Flave is 2½ times richer in flavin than dried buttermilk. It is 4 times richer in flavin than dehydrated alfalfa leaf meal. These are the ingredients that up to now have been considered some of the best sources of flavin.

When you feed the new Startena containing Puri-Flave, you give your chicks a tried and proven feed. See your Purina dealer today . . . have Startena on hand when your chicks arrive!

PURINA MILLS
Buffalo, N. Y. • St. Johnsbury, Vt.

SEE THE DIFFERENCE STARTENA MAKES!

WHAT DO I REALLY WANT?

I WANT KNOWLEDGE!

I KNOW a rising young executive whose mind and heart are so full of Wants that they tumble all over each other. He is so keen to widen his activities and influence and to take advantage of his opportunities that the days are all too short for him. He wants BIG WANTS. What do YOU really Want?

...

Do You Want Adventure?

THEN get out of the humdrum things of life. Read, study, invent, create, plan interesting things to do. Pioneer into new fields. Most of us live in a small corner of the world while there is so much around us to enjoy. The greatest adventure of all is in the full use of our own capacities.

Do You Want Achievement?

Then do the things that bring achievement—pay the price for it in extra effort, extra study, extra willingness to accept hard tasks and difficult problems. Easy sailing never won anyone a big job. The pace that kills is the crawl. Problems, hardships and difficulties are the stepping-stones to great achievement. Take plenty of time to study and adjust these suggestions to your own life.

Which Do You Want?

HIGH ADVENTURE

(These build up Knowledge)

Regular reading—a book a month.

Study courses—lectures.

Concentration and thoroughness.

New, stimulating experiences.

Some creative project.

A real "Magnificent Obsession."

THINK TALL

or

HUMDRUM EXISTENCE

(These tear down Knowledge)

No program—no problems.

Busy—no time.

No interest—drifting.

In a groove.

Why bother?

Goals? Piffle.

I'll continue suggesting WANTS in my next column. If my readers would like my program for developing WANTS, send 3c in stamps and my 12-page WANT pamphlet will be sent to you. It will DARE you to attain GREATER GROWTH.

1939 CATALOGUE now ready

GUARD Your Seed Order

By M. T. MUNN,

Seed Analyst, Geneva Experiment Station.

EVERY SPRING, just as certain as the seasons roll around, every farmer has to face the problem of getting seed to plant the various crops he has planned to grow. In getting that seed every farmer should also realize that there is no one factor which has such an important influence upon the final crop as does the seed stock used.

If a farmer has some excellent seed of known high yielding variety of his own growing and has access to a good fanning mill to reclean his cereal grains thoroughly, or has access to a more intricate cleaning mill with which to clean his clover and grass seed he is in a position to make the very best of the seed problem. On the other hand if a farmer has to go out and buy seed he should do so very cautiously and with the determination that he will be satisfied with only that which is suitable for his particular and special purposes. There is a plentiful supply of excellent stocks of adapted spring grains and clover seed now available at very reasonable prices and this spring the farmer can seed his land fairly safely if he will but use a few precautions.

When buying seed, source is all important and a farmer should be just as particular whether he uses seed from his own bins, buys from a neighbor, or from any legitimate seed source. The word legitimate can be used because there are some sources which are not legitimate in that they are not working for, or interested in the farmer's welfare, that is they are not interested after they make the sale and get their money.

Read the Label

There are a few excellent precautions to make when buying seed and the first one is most important. Is the seed of a known variety having the ability to produce profitably in your locality? The wrong variety may mean the difference between failure or success. Is the seed just as mechanically clean as thorough cleaning can make it? Does the legally required tag on the bag show the presence of any noxious weed seeds? Will the seed give a strong germination, and when was it tested? All of this information is required by law to be given on the tag or label and the buyer should read the label.

Any buyer, at no expense to himself, can find out if the label statements are truthful ones by having a sample tested. Then last, and sometimes most important, is the seed free from seed-borne diseases which cannot be controlled by proper seed treatments. This last important factor is not controlled by law and seed certification is the only official plan now provided to give or assure information on this point, however a few seed sources are giving excellent protection in that respect. In connection with all of the above it is a very safe policy to regard with suspicion any uncleaned, untested and unlabeled seed peddled from farm to farm. Such seed can give a man more grief that he can possibly realize at the moment he makes such a purchase.

When sending away for seed be exceedingly careful to check the reliability of the seedsman. The nearest telephone or mail-box is the farthest any farmer need to go to find out the exact facts on any seed source. So-called "bargain" seed may prove to be the most expensive seed one can possibly buy. Remember, that when you sign

an order for some low quality or bargain seed you may be signing an order for a big job of weed pulling for years to come, yes, even for your grandchildren to worry about simply through the introduction of a generous crop of entirely new weeds. When you are tempted to consider some low priced seed which has nothing but the low price to recommend it, do a little pencil work and you will usually find that each pound of pure germinable seed in the lot as revealed by the purity and germination percentages will cost you more than the very highest priced seed available. Then if there are screenings and weed seeds in abundance you cannot at that moment even calculate the cost of that seed to you.

Be very careful about buying, or allowing your tenant farmer to buy, some of those attractive oats of unknown variety which are sold as feed oats, or as "suitable for seed" but which are badly fouled with mustard, wild morning glory, or more important one of the bindweeds now gaining such a strong foothold in this state. Far too often such feed stocks are diverted unto seed channels and do untold harm. Seed grains of all kinds can and should be made perfectly free of all of these bad weed seeds and any seed stock carrying these weed seeds is really unfit for seeding on the land.

Finally, another excellent safeguard is to save and put away in a safe place a small sample of every lot of seed planted, together with the tags or labels, advertisements, or any other material which refers to the seed since these often serve as excellent evidence if any question arises later as to the kind or quality of the seed used. This is excellent practice even if one uses his own seed stocks or purchases from a neighbor. It will not be until farmers generally take full advantage of the possibilities available in the better seeds now being bred that agriculture will receive its greatest benefit from this one factor.

Soil Fertility Contest

Watch the next issue for winners in the Soil Fertility Contest announced on page 3 of the March 4 issue. Five additional merchandise prizes have been offered in the form of five subscriptions to the magazine "Better Crops with Plant Food" given by American Potash Institute Inc., Washington, D. C.

At least one more contest will be announced soon. Watch for this and plan now to take part in all future contests.

BRIDGE IS A SWEET GAME - I LOST TWO WIVES PLAYING IT!

CROP and FRUIT Notes

TO GET full returns from fertilizer in orchards, it is important that it be put on early. This applies particularly to nitrogen where the value comes largely from making this element available early in the season before warm weather has had a chance to make available the nitrogen already in the soil.

The Rhode Island State College suggests that 5 lbs. per tree be spread in a 3-ft. circular band about 10 to 13 ft. from the trunk. Trees uprooted by the hurricane and replaced should not receive enough fertilizer to stimulate much new growth.

THE CONNECTICUT College reports that Cornell 29-3, while excellent for other areas, is not particularly adapted as silage corn in Connecticut. For early ensilage along the seashore and the Connecticut Valley, Indiana 608, Illinois 172 and U. S. 44 are recommended. For later ensilage recommended varieties are Southern Hybrid Sweepstakes, Iowa Hybrid 129, Kato, and Golden Beauty. For late ensilage, Eureka is recommended.

In the upland parts of the state, varieties recommended for early ensilage are Ohio W-17, Wisconsin 646 and 649, and Leaming Surecross, a Connecticut hybrid. For late ensilage in upland regions, Indiana 608, Illinois 172, and U. S. 44 may be grown.

WEBSTER, a recent apple introduced by the Geneva Experiment Station, is recommended for its exceptional cooking qualities and as being the latest keeping among good apples. A limited number of Webster trees are available through the Fruit Testing Association, Geneva, N. Y. The Webster is a cross between two unnamed seedlings at the Station, the parents of both being Ben Davis and Jonathan. The variety needs cross pollination, and for that purpose McIntosh, Cortland, Delicious, or Macoun are recommended.

IF YOUR LAWN is inclined to be thin, spend money for fertilizer rather than for seed. More than any other one factor, the plant food supply available determines the growth of a lawn.

NEW ENGLAND agronomists are warning against hybrid seed oats which are being offered by some salesmen. Oats are self-fertilized, and it appears that the term hybrid oats is designed to cash in on the interest that has been aroused in double-crossed seed corn. There is no such thing on the market as true hybrid seed oats.

IF A SEED germination test on clover and alfalfa indicates a percentage of hard seeds, it does not mean that the seed is valueless. It does mean that this seed is not likely to sprout this year unless it is scarified by roughening the seed coat so that the seed can absorb moisture. Some hard seeds may sprout this year, some may sprout in a few weeks, and still others may stay in the soil for years before sprouting, finally resulting in "volunteer" plants in some later crop.

NEW YORK'S State Department of Agriculture is prepared to give certificates of origin to nurseries which grow peach trees. This action is the result of a quarantine placed on peach stock by the states of New Jersey and Delaware; and the certificates, given after inspection by the Department, will meet the requirements of the quarantine.

Big, Smart, Thrifty Plymouth

**—IT STANDS OUT AS
MOST FOR LOW PRICE**

Buyers Agree: Plymouth is the Best Buy of "All Three"

STANDARD EQUIPMENT on "De Luxe" models at no extra cost—Perfect Remote Control Shifting with Auto-Mesh Transmission.

Of the leading low-priced cars, Plymouth is biggest—5 in. longer than one; 6 in. longer than the other!

Every Plymouth model has the big, 82-horsepower "L-head" engine—giving full power, *plus* economy.

The only low-priced car with independent coil springs

as standard on *all* models.

The only low-priced car with a "safety signal" speedometer. It shows green, amber or red, according to speed.

And Plymouth is the only low-priced car with steering-post gear shift as standard equipment in De Luxe models at *no extra cost*.

THE NEW 1939 PLYMOUTH has a rust-proofed Safety-Steel body and time-proven, double-action Hydraulic Brakes.

Plymouth is the Biggest in Size—and in Value!

OWNERS OF 1939 Plymouths are amazed that such a big, roomy, full-powered car can cost so little!

Plymouth is the biggest, the *best engineered*, of "All Three" low-priced cars!

There's new riding comfort in Amola Steel coil springs...remarkable new driving "feel" with new True-Steady steering.

Easy to own...your present car will probably represent a large part of Plymouth's low delivered price...balance in surprisingly low monthly instalments.

Standard on Even the Lowest-Priced Plymouths!

NEW AMOLA STEEL Coil Springs, finest front springing design in the industry, give Plymouth its marvelously smooth ride.

DE LAVAL
MAGNETIC
IS THE WORLD'S

BEST, FASTEST and CLEANEST milker

FREE TRIAL DEMONSTRATION

To satisfy yourself that a De Laval is best, try one on your own cows. See your De Laval Dealer about a Free Trial Demonstration, or write nearest office.

There must be good reasons why

- more De Laval Milkers are in use throughout the world than any other make;
- more championship and high production records for entire herds as well as individual cows have been made with De Laval milking;
- more than 60% of all Certified Milk produced in this country comes from De Laval milked herds.
- more outstanding herds, including those of the U. S. Bureau of Dairying, are milked with De Laval Milkers.

The answer is simple. De Laval Magnetic Milkers have proven in actual use to give the best results, that they will milk faster, better and cleaner; give long, dependable service, and are simple to operate.

The De Laval Magnetic is the only milker that milks every cow every day in the year in exactly the same uniform, rhythmic way; with a fast, pleasing, alternating action that produces the best results for the longest time.

See your De Laval Dealer or write nearest office below.

Take "WEATHER WORRY" out of HAYING!

In good weather, this Papec chops your hay into the barn or stack with a big saving in time, labor and space. Good weather or bad it turns any green hay crop into good silage. A trickle of molasses, automatically added, preserves the crop in the silo.

The Papec, with its special hay feeder, handles corn better than any standard ensilage cutter. Also stores straw after combining and shreds fodder.

Send for free booklet "More Profit Per Acre." Gives reliable information on grass silage, chopped hay, trench silos and handling straw. No obligation. Papec Machine Co., 394 S. Main St., Shortsville, N. Y.

HERD INFECTION

If your cows fail to breed, lose calves, retain after-birth, have udder trouble or shortage of milk, write us. No obligation.

Send 25c for Uterine Capsule for slow breeding cows.

Box 197 Waukesha, Wisconsin

FARMERS Discuss Butterfat Cheating

THE LETTERS on this page are samples of the large number received from farmers on both sides of the problem on honest butterfat testing.

After reading these letters, and checking personally with a large number of dairymen, I have come to some conclusions, as follows:

1. The majority of dealers and milk station managers are honest.

2. There is considerable carelessness in testing, due sometimes to the great pressure under which the milk handlers have to work.

3. There is a large amount of misunderstanding on the part of farmers about testing, due to the fact that butterfat tests of cows and herds vary considerably from day to day and from time to time.

4. There is considerable actual cheating, and it is very difficult to check on this. Almost all who have written me agree that the practice of allowing the sample to remain in the dealer's possession makes any later check largely ineffective.

5. Many constructive suggestions are contained in the following letters, and others which will be published later.

Write your experience and your suggestions. Your name, of course, will not be used.—E. R. Eastman.

milk sent to milk plants, and

"WHEREAS, the purpose of such tests is for the protection of the dairy farmer and form a basis from which payment is derived, and

"WHEREAS, under the present system of taxation, the dairy farmer pays a large share of the cost of such tests but does not know the results of such tests,

"BE IT RESOLVED, That the Dept. of Farms and Markets send direct to the dairy farmer his individual composite and day samples, test and time when test was made, and period over which composite was saved."

Of course we realize that day samples do not always correspond with composite samples, but the majority of day samples should correspond, some going higher while others are lower. The principle of the day sample is to prevent the dishonest dealer from adulterating the composite sample—a very simple matter if the day sample were not taken.

We also found that the majority of plant managers were in favor of such a resolution as they felt the dairy farmer would be more satisfied if he received the check test results from the State Dept.

The plant managers also felt that the resolution might do something to force those dealers into line who are not paying by test as required by law and thus having an advantage over the honest dealer.—F. E. M., New York.

Tests Check With Plant

I belong to a Dairy Herd Improvement Association and can say that my test never varies from month to month, at the milk plant more than a point or two from what our tester makes it.

This is only one of the many reasons why I am a firm believer in the Dairymen's League. There is no financial gain to be made by the plant manager when he cheats on tests as the case might be when one sells to an independent company.—P. H. F., New York.

This Would Make Any Man Mad

In April, 1937, my test was 3.5; in May, 3.6; in June 3.4; in July, 3.6; and in August, when the strike was threatened, it went up to 3.9. I then changed factories, and my first milk delivered to them tested 4.2 and remained about the same for the four months I delivered there. Then I was forced to draw to another factory, and my test went down to 3.2.

I didn't think my milk test could have dropped 11 points from one month to the next on the same feed, so I decided to do a little testing myself. I took one quart of cream off each of four cans of milk for thirty days, and the test didn't drop one point.

I have the vouchers showing these differences in my butterfat tests. I think that something should be done to assure the farmer of what he is entitled to. The farmer don't get any too much anyway, but I think they should get what's coming to them.—B. H., New York.

Satisfied With Test

If I were guessing at a weighted average test of my herd from my dairy record returns, it would almost always be less than the test shown on my milk check.—H. R., New York.

Ten Cents a Hundred Counts Up

We have been in DHIA and Cow Testing for several years. Up to Jan. 1, 1938, the test at station and at home varied very little. Since then there has been a variation of 2 to 3 points.

Each time the tester comes we take a sample from the weight vat. That sample, tested at home by our tester, is always 2 to 3 points higher than that which the stations pays us by.

I think it is all wrong letting the station set the test and thus compute the price paid us. I think the computation for price should be set by a representative of the Department of Farms and Markets—coming on unknown dates two or three times a month. Thus the station could not compute the price.

Believe me it makes some difference in a man's business when he loses 10c per 100 pounds when he produces 36,000 to 39,000 pounds of milk per month.—M. R. K., New York.

Grange Passes Resolution

Having done A.R.O. testing in New York State and now being assistant D.H.I.A. tester in ——— County, I have had opportunity to check with several different milk plants, etc., during the 13 years since I have held a state tester's license.

On the whole, I believe that most milk plants' tests are accurate, especially in the larger companies; but having recently heard of conditions which I considered rather suspicious, I made a suggestion in our local Grange that we discuss and form a resolution to aid the farmers in securing a report from the Dept. of Farms and Markets of the check test when made. After gathering information from several small milk plants the following resolution was adopted by our Grange (Brunswick Local, No. 1337). Similar resolutions were adopted by the D.H.I.A. of Rensselaer County with a membership of 38 dairy farmers, and by the Raymertown Local of the Dairymen's League, membership of over 100.

The resolution submitted by the Legislative Committee of Brunswick Grange, which is composed of Milo Haynes, Rensselaer County Pomona Master; Allen Haynes, President of the Raymertown Dairymen's League Local, and myself, is: "WHEREAS, the Dept. of Farms and Markets does check test composite and does take day samples (which are tested) of

"Going to make GRASS SILAGE this year?"

by *Zur Craine*

Grass and legume silage is a proven success that's increasing dairy profits. If you're going to use this modern method of feeding, you'll want the *right* kind of silo and you'll want it soon. Now's the time to look into the Craine 8 Line—the silos chosen for the New York World's Fair. All latest improvements that make better silage—save tinkering and repair expense—give dependable quality with the greatest economy.

When writing advertisers be sure to say that you saw it in THE AMERICAN AGRICULTURIST.

By J. F. (DOC) ROBERTS

THE REAL problem facing our agriculture today is to find a more profitable utilization of the surplus feed that is now producing the surplus of dairy products. Yet any increase in livestock production, to be warranted, must evolve around demand, that is, whether there is a market for it. **THE NORTHEAST AND SURROUNDING STATES ARE NOT NOW FURNISHING ONE-FIFTH OF THE LIVE ANIMALS WHICH ARE BEING KILLED FOR SLAUGHTER WITHIN THEIR AREA.** In fact, over two million hogs and almost half a million cattle were killed in the New York City area alone last year. More than twice as many calves were killed in this same area, and almost a million more sheep and lambs, than there were in the great packing center of Chicago. More meat was brought into the New York area alive than was shipped in the form of meat products.

What then could help our dairymen more than the adoption of a greatly increased **LIVESTOCK FOR MEAT** program by the Animal Husbandry Departments of all our State Universities? Every good livestock man and every good livestock extension man not only knows how livestock can be produced profitably, but they continually see it being done. Ask any good sheep man or Animal Husbandry man if good management and good sheep knowledge won't produce an 80-pound top lamb in six months anywhere in the Northeast, and if there ever was a time when such a farm operation didn't make money. They know plenty of men who are doing it. In fact, most of them are doing better than this themselves.

One of our better dairymen, milking around 125 cows, told me the other day that he fed his calves milk for eight weeks, then put them on whole oats and alfalfa hay and got them into pasture as soon as available, renting this pasture at \$1.00 an acre. He sold them for beef when between a year and eighteen months old, and had records to show that they made more money than his milking cows over the same period. I ought to say here that he has large cows, practically all Holsteins, and large, growthy bulls.

Records, also, do not show a time when little 300 to 350-pound, medium priced, beef-bred calves, bought off the range along in August, would not make money—when turned on grass here in the Northeast upon arrival, fed good corn ensilage, good hay, and a little concentrate through the winter; then run on pasture the next summer, brought in before the grass gets tough and bad, finished off on grain, and sold in the late fall.

The average weight of all calves sold in the Northeast in the past six months will not exceed 100 pounds. For that reason, they are not averaging over six or seven cents a pound. Yet over this same period, good 150 to 200-pound calves have averaged to sell better than twelve cents a pound. A good 200-pound calf, then, is bringing in \$24, while our average calves are bringing in \$6.50 to \$7.00, probably less. What an opportunity for research and extension work!

These are just a few of the many ways and means that are known that will take up some of the surplus feed which is now going into milk production, not even mentioning the many farms which are making money with colts and hogs.

THE FIRST STEP in making grass silage is to make your grass grow. Top-dressing grass real early with 200 pounds of Sulphate of Ammonia produces a luxuriant growth of high-protein feed. Plenty of good grass makes you independent of the weather. It can be mowed *rain or shine* in the early bloom stage and ensiled with molasses or phosphoric acid. During the summer dry spell you have abundant low-cost, high-protein grass silage.

When clover runs out, Sulphate of Ammonia, applied to meadows, maintains hay yields with good grass that fills bare spots and crowds out weeds.

ON THE National NEWS

Talking of Taxes

MOVEMENT to revise taxes to help business has not gotten beyond talking stage in Washington. In recent press conference, President Roosevelt said that whatever is done will not cut government's total revenue from business taxes. In other words, business can expect taxes which are "different" but not lower.

Proposed changes involve getting rid of undistributed profits tax, capital stock and excess profits taxes, which now irritate and hamper business, and substituting in their place one corporation tax, with higher rates for corporations earning more than \$25,000 a year.

Some idea of heavy tax burden under which business is laboring is had from figures published in current issue of United States News. This publication points out that American business, though now earning only fraction of what it earned in boom year of 1929, is paying nearly twice as large a total of taxes. In 1929, total tax was about 1¼ billions. This year total will be about 2¼ billions. Big jump is due to tax on payrolls for social security—old age insurance and unemployment insurance. Ten years ago there was no pay-roll tax. Next January, this tax is scheduled to rise another ½ per cent.

Many tax specialists, including government experts, have been critical of payroll taxes and pointed out that they do more harm than good, because they hit all employers, rich and poor, and tend to keep small employers from hiring more men or raising wages of their workers. Experts also point out that pay-roll taxes are a tax on consumption (because tax is often passed on to buyers) and that they penalize the business that hires the most workers. Pay-roll tax rate is scheduled to rise gradually until employers are paying 6 per cent of their pay-rolls, and workers are paying 3 per cent of their income to support old-age insurance and unemployment insurance systems.

SLANT: If all of the money yielded by pay-roll taxes was set aside by the government and really spent for the purpose for which it is raised, that would be something. But such is not the case. To quote John T. Flynn, writer on economic subjects, who testified at a recent hearing held on Social Security law changes: "By 1980, the government is going to collect 111 billions in taxes for old-age benefits, but will pay out in benefits only a little over half of that. Over 47 billions of it will never be paid in benefits but will be used by the government to buy battleships, build roads and pay the general expenses of the government!"

Douglas Nominated to Supreme Court

SLATED for seat on United States Supreme Court bench is William O. Douglas, chairman of Securities and Exchange Commission. Douglas was nominated last week by President Roosevelt for seat vacated by Justice Brandeis on Feb. 13. Senate is expected to confirm his nomination.

Story of Douglas's life reads like an Alger tale. His career has included working as a newsboy, janitor, farm-hand, writer, junk dealer, tutor, lawyer,

professor at Columbia Law School and Yale University. He worked his way through college and even rode a freight train to get there.

Douglas, who is only 40 years old and one of youngest men ever nominated to Supreme Court, is known as an ardent New Dealer. His appointment to Court will give President Roosevelt the liberal majority that he wanted when he fought his losing fight to enlarge the Supreme Court.

No Change in Social Security Groups

BY UNANIMOUS vote, House Ways and Means Committee decided to postpone action on changing Social Security law to include farm labor, domestic help, and others not now included in system. Social Security Board had recommended that such workers be brought in to system, but committee indicated that this would create too many problems, and make the law "more cumbersome."

In discussing committee's action, Acting Chairman McCormack of Massachusetts said that there were many practical obstacles in the way of extending social security to farm workers. "The problems of the farmer," he declared, "are entirely different from those of industry. How would you determine wages of agricultural help? And how would you pass on the question of seasonal employment?" He also pointed out that tax collections from farmers would be difficult and complicated.

Food Stamps Coming April 15

MIDDLE of April, Secretary Wallace's new "food stamps" will get going on trial basis in a few selected cities. Cooperating in experiment are organized grocers through their national association. Plan was formally o.k.'d at recent meeting of United States Department of Agriculture officials and the Food and Grocery Conference Committee, made up of representatives of different branches of food trade—manufacturers, wholesalers, co-operative distributors, chains, and independent stores.

Details of plan were given on this page last time. Briefly, it proposes to supply needy persons who are on relief with orange colored food stamps instead of cash they now spend for food. In addition, blue stamps—equal in value to half of what they usually spend for food—will be handed out. It is estimated that this will increase relievers' food buying power annually by more than half a billion. Blue stamps can only be used to purchase foods which are declared "surplus" by Secretary Wallace. Mentioned among commodities likely to be on surplus list are citrus fruits, butter, eggs, fresh fruits and vegetables.

Government will make no effort to fix prices on "blue stamp" surplus commodities, according to recent announcement, nor will it try to control margins fixed by retailers. Local grocers will handle distribution of all surplus commodities in cities where plan is tried out and will take place of present distribution through relief agencies.

Stamps (which will come in books) must be torn out by owner in presence of merchant accepting them, and he in turn pastes them on government cards. When a card is full, it can be taken by grocer to a bank and cashed like a check.

Farm Credit News

P. C. A.'s Cut Rate

THIRTY-FOUR production credit associations in Northeast reduced interest rates from 5 to 4½% on loans made on and after February 24. Associations are credit cooperatives, make loans to farmers to grow crops, to buy livestock, equipment, or supplies. At close of 1938 they had 13,230 members in New England, New York, New Jersey.

Reasons for reduction were: Favorable money market and low interest rates on funds borrowed at wholesale. Production Credit Associations lend funds which come direct from private investors in financial centers. Associations throughout Northeast discount their members' notes with Springfield Intermediate Credit Bank; the Intermediate Bank, in turn, uses the notes as collateral to borrow at wholesale through investment channels. Intermediate bank reduced its discount rate to associations by ½ to 1%, effective also February 24.

New 4½% rate applies over entire U. S. on loans by production credit associations, will result in saving of over \$800,000 this year to some 250,000 farmers. Each farmer is a member and part-owner of his local credit association.

At close of 1938, associations in New York had 6,411 members, loans of \$5,300,000; New England, 5,002 members, \$4,600,000 loans; New Jersey, 1,617 members, \$1,400,000 loans. During 1938 credit of \$18,000,000 was handled by 34 units, mostly for farmers who switched from time accounts with dealers and merchants.

More Money Wanted For WPA

CONGRESS has been presented with another demand from White House for 150 more millions for WPA. This is amount by which economy bloc in Congress succeeded in cutting President's original request for 875 millions to run WPA until July 1.

Senators and Representatives who are opposed to granting more money at this time say that WPA is unnecessarily expensive and that the 725 millions originally granted would be enough if WPA were run more efficiently, and if undeserving persons were weeded out of relief rolls. Some steps have been taken by WPA to meet these criticisms. It has dropped 30,000 aliens from its rolls, and is said to be checking up on persons who have other means of support besides WPA. President claims that only 5 per cent of relief workers are on the rolls fraudulently.

Senator Vandenberg of Michigan has introduced bill into Senate which proposes that instead of granting more money now, Congress simply shorten by one month period over which the 725 millions are to be spent, that is

for period ending May 31 instead of June 30. This, it is pointed out, would give Congress more time to do some research on ways to cut work relief costs.

House Committee which is considering President's request is said to be in favor of granting part of it.

Hitler Strikes Again

COMPLETELY wiped out during fortnight was little republic of Czecho-Slovakia. In surprise move, Hitler invaded the country—on excuse of protecting it—and decreed that henceforth it would exist only as a part of Nazi Germany. Economic pressure within Germany is believed to have been in part cause of Hitler's action, which followed on heels of an internal crisis in Czech affairs—secession of Slovakian part of the republic, which also has now become a Germany dependency. Rest of what was Czecho-Slovakia—the province of Ruthenia—was grabbed by Hungary while Hitler's army was marching into northern and central parts of the country.

Break-up of Czecho-Slovakia started last September. To satisfy Hitler's demand for German-populated Czech territory, Sudetenland was ceded to Germany. Peace of Munich, ratifying deal, was signed by Britain, France, Germany, and Italy. At that time, Hitler promised that he had no more territorial claims in Europe and agreed to having an international commission set final frontiers for Czecho-Slovakia.

One of first acts of Nazis after invading Czecho-Slovakia was to order wholesale arrests of Czech Jews and liberals and to open a concentration camp. German trucks drove up to Czech National Bank and carted off nation's gold supply—about 83 million dollars—to Berlin. German soldiers paraded through streets of Prague, capital of Czecho-Slovakia, and Czech citizens were ordered to fly the German flag from their houses and public buildings.

As we go to press, it is reported that Great Britain is seeking to build up a coalition of nations to stop further Nazi aggression. Feared are possible German attacks next against Lithuania and Rumania. Under threat of force, Lithuania ceded to Germany last week her seaport Memel, a German city which was given to Lithuania after World War.

United States has formally refused to recognize German's conquest of Czecho-Slovakia and has condemned Hitler's action. Acting Secretary of State Wells, in statement issued March 17, spoke of Germany's annexation of Czecho-Slovakia as "wanton lawlessness."

Good Books to Read

THE PATRIOT, Pearl S. Buck. In this novel Pearl Buck has gone back to the people, and the background which she knows with such deep and unusual intimacy. The theme is China and Japan during the past twelve years, leading up to the present invasion of China by Japan. It is also a genuine love-story of a young Chinese married to a lovely Japanese wife, a story of human passions and frustrations, and valor and patience and strength, bringing to the reader a clearer understanding of the sharp points of difference between the two peoples. A stirring chapter of contemporary history. —The John Day Company, New York. \$2.50.

Good Movies to See

THE LITTLE PRINCESS. Shirley Temple's newest production is filmed entirely in Technicolor, which brings out the fact that her hair is red. And this time she appears in rags.

Cull Cows AND Grass Seed

COWS ARE UP—SEED IS DOWN. A GOOD TIME TO MAKE A SWAP

THIS SPRING a cull cow will buy more grass seed than any time in the last ten years. This ratio suggests a plan of action. Why not sell a cull cow or two to buy grass seed? You win three ways:

1. You cash in on a cow which will never be worth more than she is worth right now.
2. You make an investment in a 1940 hay mow which has a good chance of being profitable.
3. You help to cut down on milk surplus.

Milk has rarely been so low that it didn't pay to feed good cows well. It has rarely been so high that it paid to feed poor cows. Now is the time to turn boarders into cash, and use that cash to buy seed—and if necessary lime and superphosphate—to grow the best hay crop you have ever harvested.

Better Hay May Save the Day

Professor E. S. Savage, H. E. Babcock, and many other authorities believe that for the long pull the best step the individual dairy

farmer can take toward reducing production costs is to improve the quality of his hay and pasture. Fair hay has only 80% as much feeding value as good hay; poor hay is worth only 60% as much. A 1000-pound cow producing 40 pounds of 3.5% milk will need at least 15 pounds of grain if she is getting poor roughage, 12½ pounds of

The cull cow contributes almost nothing to the individual dairyman's income, but all the cull cows in the milk shed contribute plenty to the milk surplus. Why not put them on the market and take their milk off the market.

grain if she is getting fair roughage, and only 9½ pounds if she is getting good roughage.

Almost any kind of a cull cow will buy enough good, Kem-Fee treated G.L.F. seed to seed down 10 acres or more. Conservation payments will pretty near take care of liming and superphosphate. Instead of turning poor cows out to grass next month—turn them *into* grass, that will make good, economical feed for the good cows later on.

Feed Good Cows Well

Good cows, and particularly cows that will freshen this spring, should continue to be fed up to the limit of their ability to produce. Cows that are allowed to drop off in production cannot be brought back. And while milk is down compared with last year, feed is even lower. By taking full advantage of the economies of cooperative purchasing, dairymen can still afford to feed their cows well—but only their good cows.

OLD COW

Let's quit holding on to cows like these in the hope of selling them to the neighbors for more than they're worth. They'll never bring more than they will right now. Let's get rid of them and put something in the barn that has real value—good hay.

BLEMISHED COW

Cooperative
G.L.F. EXCHANGE, INC.
ITHACA, N.Y.

from Skeff's Notebook

ONE OF the outstanding instances of co-operation between farmers and chain stores is the Ontario County beet deal. Last fall the FSCC took out 180 carloads at \$10 a ton. It appeared that this was about the limit of government surplus purchases and also that the growers were stuck with more beets than they knew what to do with. The Farm Bureau made a survey and found growers in the county were holding 2,200 tons in pits and common storages.

Growers set up a committee with Andrew Muckle of Stanley as chairman to see what could be done in getting cooperation for a retail sales drive. At the meeting of the state vegetable and potato growers in Rochester in January this committee met with representatives of the chains. The chains agreed to cooperate and further meetings were held to develop plans.

It was decided to attempt to move 100,000 cases. The growers committee obtained a bid from a canner that

would permit canning at \$1 per case. R. W. Pease, Farm Bureau manager, says this was practically at cost. Harry E. Hovey, president of the Market Basket Stores, agreed to advance money for 10,000 cases to enable the canner to buy supplies, cans, etc. The A. & P. gave the largest order, for 25,000 cases. Several other chains agreed to purchase from 2,000 to 10,000 cans each.

Growers received \$7 per ton. Chain stores obtained the beets at 55 cents per dozen cans and retailed them at five cents per can. This margin of five cents per dozen cans meant that the chains handled them at a loss, because they paid for special advertising, etc. At last reports more than half of the surplus had been removed and there was little doubt that all of it would be cleaned up.

Morris Levinson, president of the Hart stores and of the State Association of Food Chains, says "the farmers asked us to do the job and we did it; that is all there is to it."

Hort. Society's Biggest

The annual report of the New York State Horticultural Society was in the mails for distribution to members two weeks earlier than last year. This in spite of the fact that it includes 448 pages, or 48 more than a year ago. Last year's was a record in size. In accordance with past years, there is demand for this book from many states and foreign countries. Its value to New York fruit growers is unquestionable. It is being distributed by Secretary Roy P. McPherson, LeRoy.

Blossom Festival May 13

Western New York's ninth annual Apple Blossom Festival will be staged at Geneva Saturday May 13. Coronation ceremonies will take place on the campus of Hobart College. Four colleges will participate in staging a pageant. Nine counties participated in the festival last year and it is possible there may be an additional county this year. Dr. P. J. Parrott, director of the Geneva Experiment Station, is chairman of the local committee.

Seek Funds for Geneva

Fruit growers of several states met in Washington recently with the appropriations sub-committee of the House Agricultural Committee to seek funds for experimental work with apple juice. The Horticultural Society was represented by Samuel Fraser, who emphasized the important work done with fruit juices at the Geneva Experiment Station. While the matter is uncertain, if an appropriation is granted the work will be done at Geneva.

Dr. V. R. Gardner, director of the Michigan Experiment Station, in a review of the juice situation recently told growers that a good apple juice would mean a million dollars additional income annually for New York growers.

Peach Outlook Good

Although there have been increased plantings of peach trees throughout the country, the outlook for northern growers is good, according to Dr. F. P. Cullian of the USDA. Summarizing

the situation, he said plantings have been mostly in southern states. He said plantings elsewhere have not been large enough to warrant anyone in this state delaying planting. His observations are that Golden Jubilee, ripening about 24 days before Elberta, is the first good yellow freestone. It is not a good shipper, but excellent for local markets. Halehaven ripening 15 days ahead of Elberta is classed as one of the best new commercial varieties. Dr. Cullian does not think Halehaven will compete with Elberta, but one of the objections heard to the latter is that its late ripening makes it a competitor with McIntosh apples.

School Bill Meeting at Syracuse

An important meeting to all who are interested in the school district reorganization bill will be held in the School of Education, Syracuse University, April 13 and 14. The meeting will be held for members of boards of education, school trustees, town officers, school superintendents, parents and taxpayers.

There will be a number of talks on various phases of the recommendations of the Regents' Inquiry, and following this there will be a number of round table discussions made up of groups of approximately 15 each.

This is an excellent opportunity to get a full understanding of the bill now in the State Legislature.

May 8 Date for Aberdeen Angus Sale

On May 8 at the College of Agriculture, Ithaca, the Eastern Aberdeen Angus Breeders will hold their 3rd Annual Sale. Past sales have been extremely successful by offering breeders an opportunity to get good stock at breeders prices.

More attention is being given these days to livestock other than dairy cattle. The idea has frequently been expressed that growing more livestock is one possible way to cut down the milk surplus. Another suggestion is that many poultrymen own more land than is needed in the poultry business and that on such farms, a small herd of beef cattle can be put on pasture in the spring to shift for themselves.

It is not suggested that many northeastern farmers should go into the beef business in a big way, but rather that they consider a few beef cows as a sideline.

New Law on Used Containers

Governor Lehman has signed a bill amending a section of the Agriculture and Markets Law. The amendment reads as follows:

Used Containers: When farm products of the same kind as the original contents are packed in used containers by others than the original packers and sold, offered for sale or transported for sale, any markings pertaining to the original contents shall be erased, obliterated or such container shall be conspicuously marked or labeled and in the case of bags or sacks tagged on the outside with the words "Not Original Contents" in letters at least one inch in height.

POTATOES

FERTILIZED WITH

Donner-Hanna Sulphate of Ammonia

YIELD GREATER CROPS AND PROFITS

There is as much Nitrogen in 144 pounds of Sulphate of Ammonia as in 200 pounds of nitrate of soda. And the Sulphate of Ammonia costs less!

In fact, the price of this efficient fertilizing material is right now economically in line with the prices of farm products, — and low as compared with the costs of labor.

The Butter Situation

By LELAND SPENCER

NOWADAYS New York dairymen seldom give much thought to butter prices. Nevertheless, the butter market is a very important factor in the milk situation. In the first place, most of the surplus milk is priced directly upon the butter market. Moreover, the prices of fluid milk and cream depend upon the butter market to a very considerable extent. The prices received by New York dairymen for milk do not follow every change in butter prices, but over a period of time a rise or fall of one cent in the price of butter means about 4 cents per hundredweight less in the price returns for milk.

Leland Spencer

At the time of this writing the wholesale quotation for 92 score butter in the New York market is 24 cents a pound. This is a very low price. It is 6 cents lower than a year ago, and 12 cents lower than the 1937 price in March. The present butter price is about 20 per cent below the pre-war average for March.

The following seem to be the main reasons for the present crisis in the butter market:

1. Low commodity price level;
2. Excess stocks of butter on hand;
3. Continuing heavy production;
4. Reduced buying power of consumers.
5. Reaction from Government pegging of the butter market.

It is hardly necessary to explain to readers of this column that prices of all basic commodities are low, averaging only 70 per cent of pre-war at present. We could not expect the price of butter to be much higher than this. Actually it is much below the average of basic commodities.

On March first the Government reported total cold storage holdings of butter at 93 million pounds. This was nearly five times the average amount for that date, and represents an excess of about 73 million pounds over the normal holdings. All of this excess butter, and some besides, is held by the Government. Since last July the Government has purchased, directly or indirectly, 137 million pounds of butter. Up to March first, about 44 million pounds of this had been distributed to families on relief.

The excess stocks of butter should be disposed of before May first, because the production during May will be more than sufficient to supply the demand. The same will be true for June, July, and August. In order to consume the extra 73 million pounds of butter before May first, the people of the United States would have to increase their normal use of butter by 25 to 30 per cent during March and April. This is not to be expected. One alternative is to carry the butter over until fall. This is impracticable because storage charges would accumulate and some deterioration in quality would certainly occur. Meanwhile the existence of the extra stocks would depress the price for all butter and would discourage private storage during the season of excess production.

Another alternative is to export the butter at a loss. At present the New York price of butter is one or two cents under the London price, but England and most other countries have tariffs or other restrictions that will make it difficult to find a market. Germany would be delighted to get this butter, but our strained relations with that country will not permit such a deal at this time. No doubt other countries with which we are on friendly terms would take the butter at a price which would let Uncle Sam out with a loss of 5 cents to 8 cents per pound. Probably it would be possible to export 60 million pounds of butter at a total loss of 5 million dollars or less. This is a small amount in comparison with the subsidies that have been paid to producers of cotton, corn, wheat, and other products. The sooner this excess butter is disposed of, the better it will be for all concerned.

This is another example of the ill-advised national policy of propping up the prices of various commodities while ignoring the fact that the basic cause of our difficulties is the low price level for all commodities.

It Will Soon Be Time to Set Berries

Grown on the Eureka Plant Farm, Maple View, N. Y., this acre of Latham raspberries yielded 3500 quarts.

The Chicago Flexible Shaft Co., 5600 Roosevelt Rd., Chicago, makers of Clip-master and Shear-master, have three excellent booklets which they will send to subscribers on request. They are: "How to Harvest the Farm Wool Crop," "The Custom Shearer," and "The Production of Clean Milk." All three booklets are well illustrated and all contain definite, valuable information.

Irving Kauder of New Paltz, N. Y., owns leading pens in two egg laying contests at Storrs, Conn., and in Georgia. The pen at Storrs is high over all breeds, started in first place, and has kept the lead throughout 19 weeks of the contest. In seven contests entered this year, livability of Kauder's entries is 98.1.

The National Distillers Products Corp., 120 Broadway, New York City, state that Produlac has proved to be an excellent source of vitamin G. Recent experiments have shown that this vitamin is very important in its effect on hatchability of eggs. Produlac has also been found to stimulate growth of turkey poults, decrease mortality and promote a more uniform growth.

Pillsbury Flour, Dept. 73, Minneapolis, Minn., offers a bargain in cast aluminum ware. There are seven pieces which can be bought at once or separately at bargain prices by Pillsbury flour users. For full details see the ad on page 21 of the March 18 issue.

Unquestionably, interest in one-wire fences is increasing at a rapid rate. A post card to the Coburn One-Wire Fence Co., 3239 West Main St., Whitewater, Wis-

In the last issue there was, in this column, a picture of Paul Stiefbold, winner of the 61st Annual Wheatland, Ill., National Plowing Match. Here is Clarence Scheoger, who won first place in the boys' class for youths 14 to 18 years of age. He is 16 years old and will not be eligible for national competition until he is 21 years old.

consin, will bring you a booklet explaining the how and why of electric fences.

"In a heating system, boiler, radiators and other equipment must be of the highest quality," says the Utica Radiator Corp., Utica, N. Y. "But," the company continues, "that is not enough. The

A new streamlined Utica Red Square Boiler.

heating plant installation must be engineered to fit your particular home."

That engineering job, furnished to customers of Utica Radiator Corp., includes measuring the house, designating the type and size of radiators for each room, and then recommending a boiler that will give ample heat during the coldest weather.

Mr. H. H. Tucker, now Superintendent of the North Jersey Branch Experiment Station at Sussex, New Jersey, will be Manager and Agronomist of the regional office shortly to be opened by the Barrett Co., 40 Rector St., New York City, at Columbus, Ohio. At Columbus promotional and research work will be conducted on the use of by-products of ammonia as fertilizer. Mr. Tucker is a native of Illinois, a graduate of the University of Illinois in 1927, and was appointed as Superintendent of the New Jersey Branch Experiment Station in May, 1931.

A new, interesting, and useful leaflet "DUST OF DEATH" has just been issued which covers an aid in the control of roup, colds, and bronchitis; and the sanitary measures to be followed in caring for poultry, both adult and baby chicks. American Agriculturist will supply you with a free copy on request.

Everyone wants to get maximum power from his tractor. "How to Get More Tractor Power," a 24-page booklet, will help you. A post card to Dept. TG-28 Ethyl Gasoline Corp., Chrysler Bldg., New York City, will bring it to you.

Eggs Get Thirsty By J. C. HUTTAR

I INTENDED to start off this particular discussion by saying something about winter being gone and spring being in the air. But before I could get my pencil in hand the air was so white that I couldn't see across the road. So I decided to delay the official coming of Spring.

J. C. Huttar

You who read this column and I who write it act, I suspect, like a bunch of human beings. When we have come through a particular problem we say, "That's that," and forget most of what we were supposed to have learned to make it easier the next time the same problem comes along.

We've just come through the winter (I hope). In the winter Nearby eggs are usually poorer than at any other time of year in a market like New York. Write that down and tack it up in the egg room next fall.

You're laughing, aren't you? Ten years ago I'd have laughed too. There were times this winter, after each real cold snap, when I felt more like crying when I saw so many packs of Nearbys coming in chilled, heated, or dried. More often dried, I believe.

I'm not sure that I know the full and real explanation for such a state of affairs. It may have something to do with the notion some folks have that only hot weather hurts egg quality. Or it may be that some folks just can't imagine eggs getting over-heated in the winter time. As a matter of fact, temperatures below 35 degrees in the egg holding room have about the same effect on egg quality as those over 70 degrees after six or eight hours. Also furnace heat in the cellar or stove heat in the kitchen has the same effect as sun heat in the summer.

I just said it may be this, or it may be that, which makes Nearby egg quality go down every winter. But I really think that water is more often to blame than anything else.

I've had more time and opportunity really to work on egg quality this winter than for a number of years past. I've seen eggs "settin" in the back room when it was pretty cold out there. I've gone into cellars where the furnace was doing its duty in keeping the folks upstairs warm and incidentally warming up and drying out the cellar where the eggs were being held. I've seen folks cleaning and grading their eggs in the kitchen.

So write this down too.

"In the winter of 1939-'40 I will have a place to keep my eggs between laying time and shipping time where the temperature will not get below 35 degrees nor above 60 degrees and I will have enough moisture in this place to keep them from drying out."

Humidity

I guess a lot of egg producers are beginning to believe that water has quite a bit to do with egg quality, but some of them haven't done anything about it yet.

An egg consists of 65% water, 10% shell, and 25% other dry matter. The white of the egg, which is just inside the shell is about 87% water. There is a close connection between this water in the egg white and the condition of that white. When a normal egg is laid

it has a layer of thick white around the yolk. As the egg loses water this layer softens and thus thins out. High or low temperatures or a lot of rough handling will have the same affect.

The thickness or thinness of this layer of egg white has more to do with the candling appearance of an egg, and so with the value of that egg, than anything else.

The shell of an egg is porous; some shells are more porous than others. That's why you have to think about water in your egg room.

Dirt floors are usually moist enough, but not always. Cement floors tend to be pretty dry. This can be remedied by sprinkling the floor daily in the egg room. Or shallow water pans with large evaporating surfaces may be placed on the floor and kept filled. Water pans with an electric fan blowing over them is another way.

The way we used to do it on the farms in Jersey was to put a pan of water on the cellar wall in the window of the egg room. The window was shaded from the sun and was always open, except in real cold weather. About a foot of one end of a half a bed sheet (an old one ripped in two) was immersed in the water and the rest was brought up toward the floor joists and into the room as far as it went. The sheet acted like a wick. The air coming in the window blew over it and through it. The eggs kept nice.

I think one of the easiest and best ways to get moisture to the eggs as they need it is by means of a bed of sand. Here's how.

You make a rack big enough to hold a day's production without having the eggs more than two high anywhere. The rack is just a frame of four sticks of wood with one-half inch hardware cloth tacked to them. This rack can be supported by saw horses or any other bracing you like about two to three feet off the floor. (Lower is better for the eggs but unhandy to work). Directly under the rack you have a three inch bed of clean sand. You then keep the sand damp at all times.

Now you bring the eggs in from the hen house at least three times each day in wire pails or wicker baskets and put them on the floor near your rack. That evening it's one of your regular chores to put the eggs from the baskets to the rack, cleaning those that are soiled as you do it. (It's easier to clean eggs the day they're laid). The next morning it is one of your chores to grade and pack those eggs into cases that have been kept near your sand bed for several days so that they won't be too dry.

That's an easy way to supply water, isn't it? And water is cheap.

"IF IT'S MEDICINE HE NEEDS I'LL HOLD HIM WHILE YOU SLIP IT TO HIM, DOC."

NEARBY MARKETS for NEARBY POULTRYMEN

Producing Profitable Pullets

By L. E. WEAVER

THIS is a discussion of brooding and rearing chicks. The average poultryman doesn't start a bunch of chicks just for the fun of running a coal brooder, buying growing mash or chick starter, picking up dead chicks and building fences to try to keep the growing stock out of the garden and the flower beds.

Not at all. He has in mind a fine lot of pullets by fall that will lay their heads off and make some money.

Pullets are profitable when they lay well, keep everlastingly at it, and are still alive and in good condition at the end of the year. Such pullets are the result of a definite combination of factors. The most important factors are: (a)

the right sort of chicks, (b) a good brooding room, (c) satisfactory equipment, (d) a complete ration, (e) correct management. Now let us consider these factors one by one.

The Right Sort of Chicks

So much has been said and written about this that it seems that no further emphasis should be necessary. The fact that more than 400 lots of Pullorum-infected chicks were sent to the Veterinary laboratory at Cornell last year indicates that too many people are still willing to take a chance. The many low-producing flocks are further evidence that people still buy chicks

without paying attention to their ancestry. When you order your chicks you have made the most critical decision of the poultry year. With poor chicks to start with all your other efforts go for naught. The right sort of chicks come from hens, not from pullets. Their mothers are carefully-culled high producers. They come from eggs that weigh 26-28 ounces a dozen. Their sires are the pedigreed sons of hens that have laid 225 eggs or more in trap nests. They come from a "good hatch", one that runs 70% or more salable chicks from every 100 eggs set. Finally the chicks are "Pullorum Clean", not merely from blood-tested stock.

A Good Brooding Room

For the starting of vigorous, rugged pullets nothing excels, to my mind, the two-room brooder house. A warm room containing the hover, a cool room for exercising. As babies, the chicks are fed and watered in the warm room, later in both rooms. Adjoining the warm room is a room large enough to let the chicks get away from the heat of the hover to cool areas at the sides of the room. Anything to avoid hot-house conditions that result in soft, flabby, weak-sister pullets. A good substitute for the cool room is the big out-doors. You may have to sweep the snow away a few times, but the right kind of chicks can take it and thrive on it.

The best brooder house has a double floor, air-tight walls on all sides, a leakless roof, and air-inlets and outlets so arranged that there are no floor drafts. It is portable. Low removable roosts are provided to teach the chicks to roost early. Good pullets can be started in long, permanent brooder houses but they are handicapped compared with the colony-house chicks.

Satisfactory Brooding Equipment

Avoid cheap equipment; seek for that which is inexpensive. There is a difference. Cheap equipment is never satisfactory. Cheap oil brooders are a dangerous fire hazard. Cheap electric brooders are poorly insulated and anything but inexpensive to operate. Cheap waterers rust out after a single season of use. Durable, well-made equipment costs more at first, but is less expensive in the long run because the cost is distributed over many seasons. Above all avoid brooders with flimsy heat control attachments. Rugged, durable thermostats are essential.

Don't scrimp on feeders and waterers. About three sizes are desirable. Start with low, shallow and narrow feeders, mason-jar waterers. At a week to ten days change to larger sizes that don't have to be refilled so often. At broiler age the birds can start using the range size feeders and waterers. There are many styles. The main points are to have enough feeders that at least half the chicks can eat at one time, a water supply that never is dry.

Batteries are good for the growing of broilers. If you want the best pullets that can be grown don't start them in batteries. In any case never leave the pullets in batteries more than 2 weeks. Possibly that rule does not apply to pullets to be grown in semi-or complete confinement. I am thinking of range rearing.

An essential piece of equipment in any disease-prevention program is the portable low wire platform on which to set the feeders and waterers. Be generous in their use.

In my next article, I will discuss rations and correct management.

RICE FARM

206 H. St., MELROSE, MASS

Say you saw it in AMERICAN AGRICULTURIST.

"We Retreat But Never Surrender," Say Dairymen

(Continued from Page 3)

being freely made that June milk will bring \$1.00 a hundred or less. That is a dark outlook, but in the long run it may be a good thing if it convinces those dairymen who honestly opposed the milk marketing order that the order was responsible for the better prices received in recent months. A month or two of starvation prices might well result in a unanimous demand by dairymen that dealers give 100 per cent compliance to the order if the United States Supreme Court reverses Judge Cooper's decision. In the long run, low prices may be a blessing in disguise if dairymen see behind the propaganda of the anti-farm gang. The anti-farm gang fought the marketing order; it has been thrown out temporarily; dairymen will lose several million dollars. Draw your own conclusions as to why the anti-farm gang

fought the order, but as the situation develops, few dairymen will believe it was done through love of dairymen or concern over their welfare!

In spite of the certainty of temporary low prices, dairymen should not be discouraged. Much has been gained. In the next few months dairymen should:

1. Resist every effort intended to destroy unity of action.
2. Wait for the Supreme Court decision on the Marketing Act.
3. Improve the weak spots in dairy organizations.
4. Attend all milk meetings held in the community. Get all the facts, and resolve that, next time, dairymen will win.

Danger of Infection Among Baby Chicks

Success in raising baby chicks largely depends upon proper care and management. Readers are warned to exercise every sanitary precaution and beware of infection in the drinking water. Baby chicks must have a generous supply of pure water. Drinking vessels harbor germs. Drinking water often becomes infected with disease germs and may spread disease through your entire flock and cause the loss of half or two-thirds your hatch before you are aware. Don't wait until you lose half your chicks. Use preventive methods. Give Walko Tablets in all drinking water from the time chicks are out of the shell and you won't lose one where you have lost dozens.

Remarkable Success Raising Baby Chicks

"Dear Sir: I see reports of so many losing their little chicks, so thought I would tell my experience. I used to lose a great many of the little downy fellows from bowel troubles, tried many remedies and was about discouraged. As a last resort I tried Walko Tablets. I used two 50c boxes, raised 300 White Wyandottes and never lost one or had one sick after using the Tablets and my chickens were larger and healthier than ever before."—Mrs. C. M. Bradshaw, Diagonal, Iowa.

You Run No Risk

Buy a package of Walko Tablets today at your druggist or poultry supply dealer. Give them in all drinking water from the time chicks are out of the shell. Satisfy yourself as have thousands of others who depend on Walko Tablets year after year in raising their little chicks. You buy Walko Tablets entirely at our risk. We guarantee to refund your money promptly if you don't find them the greatest little chick saver you ever used. The Waterloo Savings Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee. Sent direct postpaid if your dealer can not supply you. Price 50c and \$1.00.

THE ANSWERS --- to the Questions

(Continued from Page 5)

for children), coffee for adults and milk for children, nuts.

II.

Cucumber pickles and olives, creamed cauliflower, baked squash, mashed potatoes, cabbage and chopped raw cranberry salad, mince or apple pie.

III.

Cranberry sauce or cucumber pickles and olives, buttered broccoli, scalloped onions, baked potatoes, apple and celery salad, pumpkin pie, pumpkin custard for children.

IV.

Glazed sweet potatoes, buttered broccoli, scalloped onions, molded carrot salad, mince or apple pie, applesauce for children.

(Note: Fruit juice, roast poultry, stuffing, gravy and rolls may be constant throughout.)

2—Give reasons briefly for your selection.

If cranberry sauce is chosen, this means that the cabbage and cranberry salad is out because of duplication of flavors. Only one of the three yellow vegetables, sweet potatoes, squash and pumpkin, should appear on the same menu, especially if they have been mashed. The carrot salad being raw and crisp would not necessarily be excluded. Creamed cauliflower and scalloped onions should not appear together because of similarity of texture—neither would cauliflower and broccoli appear together because of nearness of flavor. (Broccoli is preferable many times because of color). Two mashed or steamed vegetables would not appear together. Apple salad would not appear with apple pie. Pumpkin pie would not appear on the same menu with squash.

3—If this suggested menu is too elaborate, what could you omit and still have a satisfying, balanced meal?

Omit fruit juice, have only 1 vegetable besides potatoes, have a generous apple and celery salad, omit the pie and let shelled nuts serve as dessert or

have fruit juice but omit salad, but be sure to have buttered broccoli as one of the vegetables because it is green.

4—How long would you roast a two-year-old tom turkey weighing 15 pounds, undrawn?

Approximately 4½ hours at 300° to 325° F.

5—Would you cook it covered or uncovered?

Cover it during part of the cooking, because it is tougher than a younger bird.

6—How would you know when it is done? When a fork stuck into the thigh next to the breast brings out juice with no reddish tint, the turkey is done. Or grasp the leg by the end of the bone and work it gently. If it moves easily, the bird is done.

7—Does the method of roasting given here differ from the method you have followed? In what respects?

8—What is the objection to putting water in the roasting pan or searing the bird before roasting?

Both practices draw out juices and make the meat less flavorful.

9—If you went to market to buy a turkey how would you know whether you were getting a good one?

The breastbone is flexible, the breasts are broad and full, there are thin layers of fat underneath the skin of the back, hips and breasts, and the skin is unbroken. The whole bird should have a creamy rather than a bluish white cast.

10—If you were roasting a fowl, how would your method differ from that for roasting turkey?

The temperature for roasting a chicken is higher, 325° to 350° F., and the length of time is greater per lb. than for turkey, 30 minutes per lb. for small

(3½ lbs.), 22 to 25 minutes per lb. for larger (4 to 6 lbs.).

LESSON VI — PIES

1—What proportion of fat to flour is used for plain pastry? For rich pastry?

Plain pastry uses 1 part of fat to 3 or 4 parts of flour. Rich pastry may use as much as 1 part of fat to 2 parts of flour.

2—What kind of flour makes the best pastry and why?

Fine pastry flour makes the best pastry because the gluten which might make it tough is small in quantity.

Name two substitutes for this "best flour".

All-purpose (family) flour; also "doctored" bread flour with 2 tablespoons removed from each cup and replaced by 1 tablespoon cornstarch.

3—If you were judging pies, what would you look for?

Good appearance, good flavor and a well-textured crust. The crust should be crisp, tender and light, flaky or crumbly, have no pronounced flavor from the fat and should be delicately brown and not

soggy underneath. If fruit or berry pie, it should have a fine natural flavor; if custard or cream pie, it should be smooth and velvety with a pleasing flavor.

4—What points do you consider of greatest importance in making good pastry?

Light, deft handling, cold fat, cold water and a hot oven to start with are absolutely essential to flaky pastry.

5—Name 6 pies using a custard or cream base.

Chocolate, coconut, pumpkin, squash, sweetpotato, butterscotch, ordinary cream or custard pies, lemon meringue pie. Pies combining custard with fruit or rhubarb also belong on this list.

6—What may be used to thicken a filling besides eggs?

Flour, cornstarch, breadcrumbs, prepared flake breakfast foods or tapioca.

7—Name two ways of preventing loss of juice from fruit or berry pies.

A paper funnel set into the top crust; a strip of cloth or an adjustable metal rim around the pan; pre-cooking the fruit or berries until juice runs and thickening it slightly with cornstarch or flour, also folding the edges of the top crust under the bottom one.

8—If you have trouble with soggy undercrust, give three ways of avoiding it.

Precook the lower crust; brush the crust with unbeaten egg white; start the pie in a hot oven (450° F.) until crust is set, then reduce the temperature.

9—If you want to save time on pie-making, how would you go about it (2 ways)?

(1) By making up a week's supply of pie crust at a time and keeping the reserve chilled. (2) By mixing one or two gallons of flour, fat and salt and keeping it stored in a dry, cool place; then moisten just enough for immediate use.

10—Remembering the menu-making instructions from Lesson V, and what you have learned about vegetables, make a 3-course menu of main course of meat and vegetables, a salad course, and cream pie as dessert course.

A cream pie or creamy dessert indicates that no creamy vegetable should be included in the meal. Furthermore, if any pie is used as a dessert, it indi-

cates that the rest of the meal should not be too hearty. One example of such a meal would be: Roast chicken or veal, stuffing, gravy, tart jelly, spinach or glazed carrots, mashed potatoes, chopped apple, cabbage and celery salad, and cream pie.

LESSON VII — CANDIES

1—How are candies classified? Crystalline, non-crystalline and miscellaneous.

2—To what foods other than candies do the principles of sugar cookery apply? Meringues, icings, and any filling with sugar as the chief ingredient, jellies, fruit syrups.

3—Why do you add acid to sugar in candy recipes?

Cooking sugar in the presence of acid tends to make the crystals smaller and eventually get to the stage where they will not form crystals.

4—Name 5 acid-containing materials which may be used thus.

Cream of tartar, lemon juice, vinegar, molasses, brown sugar.

Name 5 other materials which tend to give a smoother texture to candies or confections.

Corn syrup, honey, butter, cream, chocolate, milk, gelatine.

5—Make a list of 5 candies which you would consider wholesome for children to eat. Give a reason for each.

Fruit balls, because of the fruit content; divinity because the eggwhite prevents too strong concentration of sugar. The same applies to popcorn balls or those made from puffed cereal. Gelatine candies—same reason. Hard candies which are sucked slowly and therefore lessen the temptation to eat too much.

6—Give temperatures and practical tests for the different stages of sugar cookery.

Soft ball—238° F. Mixture forms a soft ball when a tablespoonful is dropped into a cup of cold water. Hard ball—254° F. Mixture forms a firm ball when a tablespoonful is dropped into a cup of cold water. Soft crack—270° F. Mixture makes a "crackling" sound and is brittle when a tablespoonful is dropped into a cup of cold water.

Hard crack—290° F. Mixture makes more of a "crackling" sound when a tablespoonful is dropped into a cup of cold water. Caramel stage—320° F. When sugar becomes a golden brown syrup, it has reached the caramel stage.

7—Name in each class two candies or foods using the same principles of sugar cookery.

Soft ball—238° F. Fudge, fondant and other cream candies. Hard Ball—244° F. to 254° F. Caramels and boiled icing. Soft crack—270° F. Molasses candies, popcorn balls, butterscotch. Hard crack—290° F. Molasses candies, popcorn balls, butterscotch. Caramel stage—Glace syrup (310° F.—approximately caramel stage); brittles.

8—Why should fondant be kept over at least 24 hours before shaping?

In order to let the crystals become smaller and therefore give a smoother, creamier candy.

9—In making apple sauce, why is sugar added after fruit is soft?

To prevent the fruit acid from converting the sugar to invert sugar, thus making the sauce less sweet.

Why is lemon juice added after lemon pie filling is thick?

Because the acid changes the starch to sugar and eventually to invert sugar; this would make the filling less thick and less sweet. The longer it is cooked in the presence of acid, the thinner it becomes.

10—What do you think is your greatest cause of failure in candy-making?

LESSON VIII — SOUPS

1—How are soups classified? Give examples of each.

Soups with stock—bouillon, and combinations of vegetables with meat broth. Soup without stock—cream soups and vegetable soups in which no meat broth is used.

2—What do vegetables add to a soup besides bulk?

Valuable minerals such as calcium, iron and phosphorus and vitamins are provided by vegetables in addition to

bulk and flavor. If the vegetables happen to be beans, lentils or peas, protein and starch are furnished.

3—If you were entertaining your women friends at luncheon, what type of soup would you serve?

One of the cream soups would be ideal, especially if the meat is a light one such as chicken.

4—When and to whom would you serve bean, pea, or lentil soup? Why?

A hearty bean, pea or lentil soup or a thick onion soup would be suitable for a man's supper or luncheon, especially if the man has been working outdoors.

5—Why does soup stock become thick when cold?

The gelatine drawn out by heating the meat and bones thickens when the liquid becomes cold.

6—Why add soda to tomatoes before combining with the white sauce in the cream soup recipe?

The soda neutralizes the acid of the tomatoes and therefore is not so apt to curdle the milk in the white sauce.

7—How does a bisque differ from other cream soups?

A bisque contains fish or shellfish instead of vegetables which characterize other cream soups.

8—How does a meat and vegetable soup differ from a meat stew?

A meat and vegetable soup is thinner than a meat stew, which usually has flour added to thicken it besides having less water.

9—What are the chief spices used in seasoning soups? The condiments? The herbs?

Spices used in soup are chiefly allspice, cloves, mace, paprika, and peppers either black or white; condiments are curry powder, horseradish, kitchen bouquet, and the various seasoning sauces, Worcestershire, Tabasco, Oscar, etc.; the herbs are bay leaf, thyme, parsley, marjoram and celery leaves. There are many others, but these are the main ones.

10—Do you use other seasonings for soups not mentioned here? Do you grow the herbs yourself?

LESSON IX — MEATS

1—If you were planning a company dinner and wanted the best beef roast, what cut would you order?

Rib roast, preferably the 11th and 12th ribs.

From what kind of beef?

From prime steer or heifer beef.

2—Tell exactly how you would cook it, stating size of roast.

Wipe with a damp cloth, trim off any undesirable parts, rub in salt and pepper and roast in an oven at a constant moderate temperature, 350° F. Assuming that the roast weighs 6 lbs. and that you want it medium done, allow about 2¼ hours. The meat thermometer should register 160° F. With gas or electric oven, I should prefer to start the roast in a hot oven at 500° F., for about 20-30 minutes, then reduce the temperature to 350° F. for

the rest of the cooking. The roast should be fat side up until towards the end of the cooking when it is turned over to brown the other side also.

3—If you were serving an "economy" meal, what meats might you select? (Name at least 2). Name the process of cooking which you would apply to each.

"Economy" meats might be stewing meats, beef, veal or lamb; ground meats, the above and pork also; the less choice roasts such as chuck, round and rump; and the steaks, chuck, shoulder, round or rump. These roasts would have to be cooked with water and with the lid on, while the steaks

would need to be made tender by pounding and by cooking in the presence of moisture.

4—What are the most important things to remember in cooking all tender roasts and steaks?

Tender cuts should be cooked at low temperature, uncovered and without moisture.

5—Name two favorite ways of extending the meat flavor. Cite familiar recipes illustrating these methods.

The flavor of meat may be extended by combining meat with vegetables or bread crumbs in stews, stuffings, or in meat loaves. Stuffed flank steak, or any stuffed meat, hamburger meat loaf or any of the stews are examples.

6—How does fresh pork differ in appearance from fresh baby beef?

Fresh pork should have a fine grain and is nearly white while the fat is firm and white. The flesh of baby beef is light red, firm and velvety and fat is white and flaky.

7—What differences, if any, would you observe in cooking the two?

Pork should always be thoroughly cooked—from 180° to 185° F. on the meat thermometer for roasts. The beef may safely be cooked only rare or medium; otherwise the process of cooking is practically the same.

8—Tell how to broil lamb chops, giving temperature and length of time.

Lamb chops, cut $\frac{3}{4}$ " thick, should broil 10-12 minutes in a moderate oven (325°-350°) and should be kept about 3" from the source of heat. The chops should be cooked completely on one side before turning them. Salt and pepper, if desired, are sprinkled on when turned.

9—Make a menu suitable to serve with (a) broiled steak; (b) with lamb stew.

A good example of a menu suitable to serve with broiled steak is French fried potatoes, peas, combination salad, and fruit whip. (b) Stew: boiled potatoes, green beans, lettuce salad, coconut custard pie. Remember to use light dessert with heavy meat and not to have too many runny dishes in the same meal.

10—Name cuts of beef needing to be cooked in the presence of moisture unless ground up.

The less tender cuts which need to be cooked in the presence of moisture are chuck, shoulder, flank, heel of round, crossarm, clod, skirt, shank, and brisket.

LESSON X — SALADS

1—What do salads add to meals besides pleasure?

Salads add vitamins, important minerals (iron, calcium and phosphorus), vegetable fiber and attractive colors to the diet; also crispness and flavor stimulate the appetite.

2—What inexpensive salad greens are easily available now?

Raw spinach leaves, cabbage, Chinese cabbage, watercress, lettuce, celery and parsley. Additional salad materials which could hardly be classed as "greens" are carrots, onion, radish, raw turnip, cauliflower flowerets.

3—What kind of salad and what dressing would you serve with this meal: roast fresh ham, candied sweet potatoes, spinach, brown Betty pudding?

A green salad with French dressing or one of its variations; a tart fruit salad made of grapefruit and orange sections with lettuce and French dressing would be equally pleasing. Whatever salad is used should be light.

4—Make a menu featuring a hearty salad.

Cream soup, meat or egg salad, green peas, potato chips, hot rolls and butter, lemon chiffon pie. The meat in the salad would likely be shrimp, chicken, salmon or tuna.

5—What do you consider the most important points to remember in making salads?

All ingredients should be clean, cold,

crisp and dry. Salads should be served attractively on cold dishes. Color, flavor and texture should be pleasing, considered as a single dish or as part of the meal.

6—Imagine that you have week-end guests: what salad dressings will you have ready in the refrigerator? How will you vary them (name the salads you will serve with these variations)?

French and mayonnaise dressings. The usual supply of chopped pickle, chili sauce, olives, onions, whipping cream, hard-cooked eggs, parsley, and herb vinegars would give a great variety to both types of dressings or to cooked salad dressing. French dressing and its variations go with the light salads; mayonnaise or cooked dressing with the heavy fruit, meat or vegetable salads.

7—What makes mayonnaise thick?

Mayonnaise is thickened because the fat is completely emulsified and combined with the egg yolk.

8—Why does French dressing separate upon standing?

In French dressing, the emulsification is not complete as there is no egg yolk to act as binder. Therefore it separates upon standing.

9—Give two advantages of a cooked salad dressing.

Less expensive, agrees with some digestions and appetites better than oil; ingredients usually at hand.

10—What salad is used most often in your family? What is the reason for its popularity?

LESSON XI — BREADS

1—Why does hard wheat make better bread flour than soft wheat does?

Hard wheat flour contains more gluten which gives elasticity to the dough, hence greater rising power.

2—How does yeast make bread light?

As the yeast feeds upon the sugar and starch in a bread mixture, carbon dioxide gas is given off. As this rises, it is enmeshed in the gluten which stretches upward, thus filling the dough with gas bubbles which make it light.

How are quick breads made light?

A gas is formed by the combination of the alkaline baking soda with the acid of lemon juice, vinegar, molasses, cream of tartar or sour milk. If baking powder is used, the baking soda in it combines with the acid of cream of tartar, sodium aluminum sulphate or the phosphate in the phosphate powders to release gas when the baking powder meets either milk or water.

3—Why is yeast bread kneaded and quick breads only slightly so, if at all?

Kneading makes gluten more elastic, thus causing it to enmesh more gas bubbles. Kneading also makes a tougher bread, not desirable in quick breads which should be very tender.

4—If you were buying your flour in bulk, how could you tell whether it was better for bread or cakes?

Bread flour feels gritty when rubbed between thumb and fingers; it also falls apart and does not hold the imprint of the fingers very well when squeezed in the palm. Cake flour holds the imprint clearly. Bread flour has a creamy or yellowish look whereas cake flour is much whiter.

5—Looking at the recipes given here, how would you classify each one as to batter or dough proportions?

Pour batter: Popovers and griddle cakes. *Drop batter:* Muffins. *Soft dough:* Baking powder biscuits; yeast bread.

6—In which class would pie crust belong?

Stiff dough.

7—How would you classify Foundation Cake?

Drop batter.

8—How does the dough of yeast rolls differ from that of yeast bread?

Richer in fat, sugar and eggs.

9—What have flour manufacturers put

on the market in recent years to make quick breads easier to make? Name at least five different brands.

Self-rising flours containing salt and leavening agents shorten the time for making quick breads. Some mixtures also have the fat incorporated, so that only the liquid needs to be added.

10—Do you make yeast breads at home? Do you use dry or compressed yeast?

LESSON XII — PUDDINGS

1—How is a pudding distinguished from other desserts?

A pudding contains cereal or cereal products which may or may not be pre-cooked.

2—What precautions in cooking must be observed if the pudding also has a custard base?

Eggs should be added after the starch has cooked thoroughly; prevent streaking by pouring some of the hot mixture over the beaten eggs, then combine both mixtures. Combining part of the sugar with the beaten eggs is a further precaution against streaking.

3—Name 5 puddings using batter as binding material.

Cottage pudding, upsidedown cake, plum or other fruit and berry puddings, the famous English steamed puddings, plain or otherwise.

4—What cooking processes are used for cooking puddings?

Boiling (not used as much as formerly), moist and dry steaming, baking.

5—If there are children in the family, what types of puddings should be emphasized?

Such puddings as cornstarch, creamy rice, simple milk puddings and those with a custard base. Avoid rich, heavy puddings.

6—Make a menu suitable for family use when carrot pudding is the dessert.

A light meat such as chicken, or a heavy soup or heavy salad; a green vegetable, potatoes, light salad if heavy soup or meat is used.

7—If you thicken your cherry pudding sauce with flour instead of cornstarch how much flour would you use?

2 tablespoons flour per cup of juice.

8—If you preferred to thicken it with egg, how much would be needed?

Two eggs per cup of liquid.

9—Give as many reasons as you can think of for including fruits in puddings.

Color, flavor, minerals, bulk and fruit acids which promote elimination.

10—Is pudding a favorite dessert of your family? Name any particular favorite.

The Fashion World

THIS is the title of *American Agriculturist's* spring fashion guide. If you plan to do any sewing this spring, or if you want a concise and delightful guide to current styles, don't miss this little book. Its twenty-three pages are crammed with the most attractive patterns that we have seen anywhere.

For your copy of this new, smart spring fashion guide, send 12 cents to Pattern Department, *American Agriculturist*, 10 North Cherry St., Poughkeepsie, N. Y.

PLAN A Basic Wardrobe

COLORS this spring run to safety in numbers. It is quite correct to have three or four of the same tone but in entirely different colors.

Other very practical ideas are the basic dress, and the two or three piece outfit which permits many different combinations of blouse, skirt, jacket and sweater. Both ideas apply equally well to new outfits or to renovating old ones.

DRESS PATTERN No. 2513 is ideal for a basic dress of solid color or print fabric with the separate panel in contrasting or matching materials. Thus it may serve as a tailored dress or as a softer one for informal dress wear. Pattern sizes are 14, 16, 18, 20 years, 32, 34, 36, 38, and 40-inches bust. Size 16 requires 2 $\frac{3}{4}$ yards of 39-inch material for dress; and 1 $\frac{1}{2}$ yards of 39-inch material for separate panel.

PATTERN No. 2646 is practically a whole wardrobe within itself. Use solid color sheer wool or crepe for skirt and jacket with print crepe for the blouse, or this plan in reverse. The pattern includes two different types of jacket which make it all the more useful. This may be had in sizes 14, 16, 18, 20 years, 32, 34, 36, 38, 40, 42, and 44-inches bust. Size 36 requires 1 $\frac{1}{4}$ yards of 39-inch material for blouse; 2 yards of 39-inch material for skirt; and 1 $\frac{1}{4}$ yards of 39-inch material for bolero.

TO ORDER: Write name, address and pattern size and number clearly and enclose 15c in stamps. Address Pattern Dept., *American Agriculturist*, 10 North Cherry St., Poughkeepsie, N. Y. Add 12c for a copy of our new spring fashion catalog.

MUFF — A Serial Story By C. A. STEPHENS.

INSTALLMENT TWO.

THUS inauspiciously introduced into a "world of trouble," as some gloomy-minded people choose to call it, the proper thing for our little four-pound hero to do, might seem to have been to die. But he didn't die. Perhaps it didn't occur to him that he ought to do so. He took to earthly life with a will, or it may have been the Jersey milk which he took to; and after weazening about a week, he set to work to catch up with the common run of babies in size. To do so, he began expanding his lungs and developing this thorax by the usual method.

Didn't that whilom quiet little cottage echo! Never had anybody heard such steady, sustained wailing. He cried eighteen hours to the day, and would have cried longer, if they had not diligently undermined his natural constitution with soothing-syrup. And he cried lustily. He cried as if he meant each screech of it to count ten—as if he intended each yell to be his frantic but solemn protest against the disadvantages he had been born under.

Picture the sufferings of the "Ransom girls!"

But he took the wrinkles out of himself at last, and stopped crying at just twelve o'clock one night. It seemed as if his contract had expired. Thereafter, for some days, he lay with wide, unwinking eyes, apparently taking in the whole universe and grasping the situation. One morning, when Mary accidentally tickled his mouth with the rubber nozzle of the Jersey-milk bottle, he suddenly electrified that elderly damsel by pulling a new set of wrinkles into his ten-cent bit of a face and laughing aloud in low ecstasy of delight. And he did it again and again.

After a time, the necessity of naming the child began to present itself. They called in the Congregationalist minister and one of the school-committee, Mr. French; or rather, the gentlemen came of their own accord, feeling, perhaps, with Mr. Murch, a sense of responsibility in the matter. Mr. Atkinson, the minister, proposed the surname of Nemo, as a classical substitute for the entire absence of any. After some discussion, they decided upon Henry Nemo. Mr. Atkinson made an entry to that effect in his book of marriages and births, and Mrs. Murch had the town clerk make similar record of the name and date.

But in such a case it is one thing to christen and quite another to make the christening hold. The "public generally" did not take to Henry Nemo at all, as a name. Folks had already begun to call the baby "Little Muff Ransom." That stuck. There was an awful adhesiveness about that catskin muff. The Ransom girls kept the muff to show to their callers, who were now numerous; and next, after laughing about the muff, all these visitors laughed about Marcia and Mary, and how "chipper" they were over that baby, and how fresh they were looking that winter, particularly Mary. Everybody said that Mary had "renewed her age," and "who'd a thought" (so they talked), "that the little dried-up old thing could act so motherly!"

When this baby had whitened, as babies will in the air of this world, he was found to be of a light complexion; he shed his black hair and put forth a thin, putty-colored growth in its place; and he was found to have a "mark", and some thought it a very bad mark indeed. It was a little pale crimson ring around his neck, and it grew more plainly visible every month. Old Polly Day, the Corners busybody,

was the first to discover it, or, at least, to report it abroad. She had called and was holding the infant when she saw it.

"Massy sakes!" she cried out, and jumping up, put the child hastily in its cradle. "'Tis the gallows mark! He's born to be hung!"

And she went and told everybody she met.

CHAPTER II.

"BORN to be hung."

Of course, that was a silly as well as a cruel superstition; yet even in this century of knowledge there is still a great deal of latent credulity concerning "signs" and "marks". Marks like this tiny crimson ring round little Muff Ransom's neck may be given by mother to child from various perfectly natural causes, and as such are no more of evil portent than the color of the hair or the eyes. In the case of Muff, I have no doubt the sneers and twitterings for which that mark was the pretext, had a good deal to do with the recklessness which the boy afterwards evinced.

This talk about the mark annoyed Mary, the more because great, bluff Mr. Murch would come to her cottage every day or two, and, after his boisterous fashion, without meaning any harm, ask to see, "my little gallows-bird."

Ten years passed. In the circumscribed and poverty-stinted atmosphere of that little brown house at the edge of the "piney common", Muff lived and grew to be a lad, being much alone, and thrown utterly on his own resources for amusement and play. I have a little "tin-type" of him, taken when he was thirteen years old by a traveling photographer, who stopped at the Corners for a week.

At the district school Muff is remembered as a silent boy, with blue eyes and hair exactly the color of putty. He wore his little frock and jacket-collars high, to hide the "mark". Yet he had a very well shaped head, set on his small shoulders with a decided "air". It was difficult to make him talk much, but at any game which the boys played, he would get excited; his eyes would shine and snap, and he

would run like a squirrel at playing "goal."

Once during the summer-school, some of us older boys called at the school-house at noon, and found all the children "playing-at-farms" in the yard. They had miniature houses and barns and sheds; little fields walled and fenced off in nice order, and for cattle they had "daw-bugs" and the children said that Muff started this kind of play.

Another peculiarity that I remember in the boy, when he attended the winter schools, was that he seemed to be constantly hitting his "crazy-bone." One of his elbows seemed to be all "crazy-bone." He never made any outcry when he was thus hurt, but would give a jump forward and shake that hand. It made a good deal of fun for the scholars. Once, while a young lady teacher was instructing him to hold his pen correctly, they happened, between them, to hit his "crazy-bone", when Muff gave a leap upwards, knocking the poor teacher's head so that her hair almost came down. She was at first very indignant; Muff made no attempt whatever to explain, and she was on the point of punishing him when one of the boys interposed, saying that "'twas nothing but his crazy-bone." At this the teacher laughed heartily, declaring that she was conscious of having a "bone" of her own, and then went on to explain to us that this so-called ulnar nerve which in its course around the inner side of the elbow, is often exposed to a blow.

At home, with old Marcia and Mary, Muff was never taught to work very much. He did their chores after a fashion of his own. When he was about ten years old, Mary died of fever, and Marcia had never cared for him as Mary had. Nevertheless, the two lived on together in the little weather-brown cottage.

They had a flock of geese, some hens, and a grizzly Durham cow. Muff used to drive the cow to pasture, and go after her nights. We older boys laughed at him for "driving the geese to water." The cow-pasture was a little four-acre plot, bordering the woods and a large tract of "common" to the northeast of the "Corners". The

The Amateur Poet's Corner

Because of the number of contributions, we do not return poems not published. Keep a copy of your poem.

The limit in length is sixteen (16) lines and poem must be original and written by an amateur. \$2.00 will be paid to the author of each one printed. Check will be mailed on or about first day of month following publication.

Maine Farmer

I like rough men
With faces lean and brown,
Foddering their cows at dawning,
Turning their steps homeward when
the sun goes down.

I like their eyes,
All crinkly from the sun,
Brooding over the wooded hills
With gaze distant and quiet when day
is done.

I like their bigness.
Their stride is slow and long,
With a firm and vibrant thudding
Like the deep, pulsing rhythm of some
native song.

They seem to draw
Their silence from the trees,
Roughness and strength from the
mountains,
Loud and hearty laughter from the
cold, thin breeze.

—Phyllis Stefano,
Farmington, Maine, Route 3.

fence around it was a poor one, and "Old Grizzly" frequently got out and strayed off upon the common, where it was difficult to find her.

But Muff saved himself the trouble of going after the cow by a bit of ingenuity which is without a parallel, so far as I know, and for the entire truth of which I can vouch. The geese, in fact all the geese at the Corners, were descended from a pair of wild Canada geese, which had been brought there some ten years previously. They were hardy, large, gray and white geese, and the Ransom girls had in their flock a very fine gander, having all the characteristic markings of its wild parentage. Unlike most domesticated geese, this gander was a powerful flyer, and often of a morning we would see him taking a flight high over the village and across the river, with his deep honk! honk! Occasionally he was able to allure some of the other geese from the ground to join him; but they always came back to their respective homes.

Muff taught this gander not only to drive his cow home from pasture, but to find her when she had strayed off a mile or two through the woods and bushes on the common. How he did it, I cannot say, for the first we knew of the gander's habit, was from seeing him drive the cow in the night, biting her legs vigorously if she loitered or attempted to get away.

About six o'clock at night Muff would let down the bars leading into the lane, and immediately "Job" (that was the gander's name) would set off after the cow, and by some keenness of ear or of scent, he always found the cow, no matter how far she had strayed. The animal wore a bell, but it is often difficult for a man to find a cow in a large common even when the animal wears a bell. Generally Job would be at the bars, waiting for Muff to let them down; and if he delayed too long, he would set up a prodigious squalling, quar-quar-quar-quark! so that all about the Corners the folks would say, "Old Job wants to go after the cow."

Job would drive Old Grizzly home, follow her into the barn, make her "head up" in her proper place, and then

The Song of the Lazy Farmer

3-25

here place, so just git up and take your face out to the woodpile for some sticks or you'll be in a worser fix." She made me fill the water pail, and then for fear that I would fail to understand that she was boss, she made me go hitch up the hoss and plow the garden till, by gee, no one could be as tired as me. I've learned that there ain't any need to go by ev'rything you read!

I READ a piece the other day when Jane Mirandy was away, that said us men should be the boss; a family is a total loss, it said, when men are calm and meek and keep still when the women speak. A man should rare up on his feet and not be allus nice and sweet, but rule things with an iron hand and let the women understand that he's the boss and rules the roost. So when I thought the way I ust to jump when my Mirandy Jane told me to bring in wood again, I just resolved that I would be a real and tough he-man, by gee, no longer would I just submit to Jane Mirandy's orders, it is time for me to take a chance and let her know who wears the pants.

So when my wife came home I sat, nor moved from there where I was at, I told her to fix up the fire; I guess my tone aroused her ire, she socked me with the rolling-pin, she says: "It's too late to begin to think you're boss of this

Sold For \$373.75 an acre

(Continued from Page 1)

no touch of frost and the big, yellow dent corn was not only ripe but hard and dry. It must be a comfort to farm in a country where there is no soft corn.

Now before I go any further, let me clearly and unmistakably state my belief. I do not for a moment admit that Lancaster County is any better soil than a good many localities that I could name in New York. Just at random I might specify the region around Batavia or Stafford or Canandaigua or Geneva or Penn Yan or Bouckville or Middleburg or an hundred other localities which could be mentioned. Also I feel sure that there are some New York farmers who are just as good farmers as any who can be found in Lancaster County, but as a loyal New Yorker, I must admit that I know of no extensive countryside in our state where there is such a high general average of sand-papered, polished farming or as large a proportion of big barns and tall silos and imposing brick farm houses.

WHEN I was corresponding concerning the best way to see the Pennsylvania Dutch farmer, Mr. Mylin wrote me that on September 30th, there would be a public sale of a farm and he expected this would bring not less than three hundred and fifty dollars per acre and he thought it would be worthwhile for me to attend. I immediately planned to make my visit include this date because I felt that even to see a real farm sold at such a price would be something well worth the telling about in coming days.

Now when I relate this tale, please understand that this farm was sold distinctly and entirely for agricultural purposes. It was not, as might be supposed, a case where a rich city man was buying land for country estate, careless as to just what the per acre price might be. The region adjacent to Philadelphia has its full share of ornate estates, but that type of life has never invaded this part of Lancaster County. Neither was it a case of a real estate promoter buying land for the purpose of cutting it up into residential lots for suburban development.

Anything of that kind is entirely out of the picture in this locality. It was purchased because a neighboring farmer wanted more land in order that his son might set up as a farmer. The owner was selling not because he was in distress but because he was getting old and had no son to follow him on the farm and he wished to set his affairs in order while there was still no need for haste.

THE location of the farm was good but not exceptional. It was more than a dozen miles from the nearest large town (Lancaster) and it was on a good black-top road two miles off the trunk line highway—a fact that to my mind is advantageous rather than otherwise. The house was a big fine brick structure but it had not been built by city money. It was just the home of a working farmer who had lived there a great while and whose industry and skill through many years had made him well to do and he was willing to spend some money for the comfort and convenience of a modern home. The barn was one of the big, substantial structures, characteristic of that region. In the foundation was set a marble block with the simple inscription, "BUILT BY NOAH AND ELIZABETTA NOLT 1902." I like the man who in his farm affairs is chivalrous enough to couple his wife's name directly with his own. The acreage was ninety-eight acres. Farms in this locality run rather small and sixty acres

are deemed a very good sized holding. This makes an unusually dense rural population.

The sale was announced for 1:00 P. M. and it began almost on the minute. Again let me ask you to remember that this sale included no implement or tools and no live stock—just the land and buildings. As far as I know we here in New York always think of values and discuss the price of a farm as a unit—so much for the farm. In Lancaster County I was told that the acre was the unit of value and men spoke of a farm as being worth so much per acre.

There were about a hundred men present. Most of them wore the "plain" clothes and round, black felt hats of their faith. A few had the shaven upper lip and full beard of the Dunkards. Perhaps ten per cent of them were the "world's people", unmistakably distinctive from the others. Only three or four of them were there with the idea of actual purchase but to see one of these ancient farms set up at public sale is really a noteworthy historical event in that community and well worth taking an afternoon off in order to attend.

THE auctioneer seemed to me a past master of his somewhat specialized profession. Usually he made use of English but once in a while, when business was slow, he dropped into the local German vernacular. What he said was perfectly unintelligible to me but the chuckles of laughter that ran over the group, indicated that he reserved this tongue for his choicest observations. First he announced the terms of the sale—10% to be in cash on the day of the sale and the remainder on April 1st, when possession would be given. Then he announced, "I have three advanced bids for this property, one of 320.00, one of 330.00 and one of 340.00 dollars per acre. How much am I offered?" The bidding started slowly and ran up at first five dollars for each bid, soon dropping to one dollar increases and long before the finish he was accepting twenty five cent advances. It was a leisurely, long drawn out process. Before it began, I was told that it would take two hours, which proved almost exactly correct. Sometimes there would be long pauses between bids. Once or twice everything was suspended for extended whispered colloquies between the auctioneer and the owner. I thought that at the last the dramatic moment came rather suddenly. Perhaps the auctioneer was psychologist enough to know when everybody was really through. In his hand he held a crook-handled cane, a sort of badge of office, of which he had made a good deal of use. Presently he held it aloft and let it slowly swing back and forth like the pendulum of a clock, ticking off the seconds. "Going—Going—Going—Once More—Are you all

done? and SOLD to Isaac Zimmerman for three hundred and seventy three dollars and seventy five cents per acre."

To me it was a rather splendid moment as proof of the fact that there are still felt on earth men who have a great confidence and belief in life on the land. In one respect the final surprised me very much. I am sure that with us a tremendous round of applause would have marked the finish. As it was, silence fell and no man said a word. I suppose those austere "plain" people felt that any demonstration would have been a breach of decorum, unbecoming to their faith. As for me, I felt that I had witnessed a great event. A moment later the auctioneer announced, "Sometime in the month of March at this same place I will sell the tools and live stock of this farm." Immediately the crowd melted away.

OF COURSE I know the perfectly obvious and almost unanswerable statement that will be made in regard to a sale of land at this fantastic price. It is to the effect that by no possibility can land be made to carry the interest charges on such an inflated valuation. This is a general statement to the truth of which I unhesitatingly subscribe. There are a few very intensive crops—I can think of head lettuce and celery and perhaps onions—which may pay out on very high priced land, but this is surely not true of such crops as corn and wheat and clover and market milk and beef-steers and tobacco, which are the staples of Lancaster County. Tobacco, it is true, is an intensive crop and capable of large returns per acre, but after all it is only incidental to their other farm operations and can hardly be said to set the value of their land.

The real reason for these almost fantastic values is that here is a locality where, when a farm is offered for sale, there are always many people, who wish to purchase it. They told me that any good farm was worth three hundred and fifty dollars per acre and that land has never been worth more than now—not even in the roaring Twenties.

These Pennsylvania Dutch boys are coming up to believe that the best place in life is on a Lancaster farm and they are willing to pay what to us seems a wholly fictitious price in order that they may remain in their own community among their own kinsfolk and close by their ancient church. I take off my hat to people who are willing to pay for land a couple of hundred dollars an acre above its strictly agricultural value in order that they may enjoy these intangible, yet wonderfully real advantages.

* * *

AUTHOR'S NOTE: Acknowledgements and thanks are due Mr. Arthur B. Mylin, Superintendent of Schools for Lancaster County and to Mr. Gust, his colleague for help and counsel in securing the data for these articles.

MUFF

(Continued from opposite page)

stand by 'till Muff had "bowed" her up. In the spring and early part of the summer, for several years, Job would stand by while Muff milked, and keep the calf back, not allowing the eager little creature to come to its mother 'till Muff had finished his milking. Both cow and calf were afraid of the gander, and with good reason, for he was a grievous biter, and could have well-nigh beaten down a man with his powerful wings. As Muff milked, the gander would walk slowly back and forth by the cow's side, with a low quar-quar-quark! At first, 'till the calf had learned obedience, it would try to rush past the gander, whereupon Job would seize it by the nose and flog it with its wings, 'till it was glad to run away and wait.

Kernels, Screenings and Chaff

By H. E. BABCOCK.

THE OTHER day, there stopped in at SunnYGables a man who had driven some fifty miles to make a suggestion which he said he hoped I would print on this page.

Ever since his visit I have debated the merit of his idea. This gentleman said that his investigations had convinced him *that all through the country the cost of legislative bodies has kept pace with the increased costs of government which are now proving so embarrassing to our budget makers.*

His idea, for what it is worth, was that the Republican Party—being in control of the Legislature in the State of New York, and New York State being faced with a budget deficit which is proving very difficult to meet in view of the popular determination to pay no more taxes on real estate—has before it a great opening for a telling political move.

Cut Its Own Expenses

If the New York State Legislature, this man believes, would take the step of first cutting its own expenses and then, having gotten on firm economic ground itself, proceed to prune the state budget, the Republican Party, so thought my visitor, would immediately win a lot of new friends—not only in the state but throughout the nation.

The more I have thought of his suggestion, the more it sounds like just good political common sense. Certainly the situation is ripe for a move by some political group which will prove its sincere desire and intention of cutting the costs of government. While I don't suppose that the Legislature of the State of New York can cut its expenses more than a few tens of thousands of dollars without cutting so deeply into its members' patronage that it will hurt, *even a five or ten per cent saving*

in its expenses would prove its sincerity and its good intentions.

I submit my friend's idea for what it is worth to those good-intentioned New York State legislators who are right now uncomfortable and embarrassed because their constituents are saying in no uncertain terms *that there must be no increase in real estate taxes and that all the costs of government must come down.*

* * *

Farm Notes

For the past two weeks our winter barley has been taking a real beating. Thaws, alternating with weather—as cold as two above zero, have hammered away at it until it is beginning to look a little brown and tough. Whether or not it will come through and make a crop, of course, remains to be seen. I think I have reported here that the winter barley we are growing this year is not the Polish type which has proved so hardy, but a strain which we got from Virginia which has barbless awns and a stiffer straw than the Polish barley.

OUR WOOL CROP

Unless we sell some of them before shearing time, which we have set for

April first, we will have to clip about two hundred and fifty ewes. This will make quite a pile of wool to add to the roomful we have already accumulated from our '37 and '38 clips. As things stand today we made a mistake in not selling our '37 clip, but we are ahead because we didn't sell our '38 clip. Right now we can't make up our minds what to do with the accumulated three clips. Is there any wool market prophet among the readers of this page who is sure of his dope? If so, I would like to hear from him.

GUERNSEY HEIFERS

We have wintered some fifty Guernsey heifers in pens which, except on extremely cold nights, have been open to the outside all the time. We have fed these heifers grass ensilage, some chopped second-cutting alfalfa and clover.

American Agriculturist, April 1, 1939

they have been fed all the grain they would clean up each day. The calves under this system of management have done very well indeed. The cows, however, are thin and look pretty hard. There has been a bull with them most of the winter, but we don't know whether they have all bred or not.

Right now we are undecided whether to wean the calves when we put their mothers on pasture about the first of May or to let them run with their dams for a month on good pasture, meanwhile continuing to feed them grain in the creep. I presume that our final decision will be based on whether or not we have the time when we turn out to take care of weaning the calves.

SPRING PIGS

Our spring pigs are all here. We fell just short of the fifty mark which

The team drawing this spreader is the last pair of colts we have left at SunnYGables. I am sure that when Jake has them completely broken in he will breathe a sigh of relief because he has been breaking in one pair of colts after another for the past two years.

and in the case of a few individuals, a little home-grown grain.

The heifers have grown well and right now are in tip-top condition. The only serious trouble we have had with this way of wintering has been with an occasional heifer which started in to hook the living daylights out of her pen mates. Because the heifers were in several different lots we have been able to handle most of these situations by putting the obstreperous animal into a pen with an animal strong enough to give her a licking. While this remedy works, it's a bit rough and we would like to know of some better way of dealing with the scrappy animal, short of dehorning her.

ANGUS CALVES

We had fifteen two-year-old Angus heifers freshen with their first calves last October and November. We have not yet weaned these calves.

The cows have run loose in a basement open to the outside on the south end. We have fed them all the grass silage and hay they would clean up and a little grain. The calves have had free access to a creep in which

we had set as our ideal crop. The sows are all running together in the basement of one of our barns. We have built a creep for the pigs, and on the combination of mother's milk and a good hog feed they are growing like weeds. On a cold day they pile up as many as three deep. I wonder how it feels to be at the bottom of such a pile. Perhaps, if the weather is cold enough, better than to be on top.

TRAINING COLTS

With only one pair of colts to break this winter, Jake hasn't had as many horse chores as usual. Incidentally, he and I haven't seen entirely eye-to-eye on this last pair of colts. You can draw your own conclusions as to who has had his way. Sometime I am going to buy a horse all for myself.

Our disagreement has been based on the fact that I didn't feel that Jake was keeping the colts fat enough. He contended, on the other hand, that he didn't want them fat until he had them well broken and that then he would build them up by heavier feeding as he worked them. Probably he is right; at least, as I hinted above, that's what is being done.

Up at Larchmont the young folks (we usually speak of them as the kids) have become interested in milch goats and now they tell us about their kids—the first one of which is shown here.

WHO CUT THE PRICE OF MILK?

An Open Letter to the Producers of Borden's Milk

FOR twenty-five years the New York milk industry has been striving toward the goal of orderly marketing. Throughout this period of years some distributors and some producer groups have given their best efforts in the search for an orderly milk marketing program; some have not.

The keystone of orderly marketing is equality of price and equality of obligation to every producer and every distributor. This does not mean gouging the public. Price-cutting—some people call it chiseling—which is made possible by failure to recognize these obligations does not mean benefitting the public.

An orderly marketing program calls for stable prices, fixed no higher than necessary to insure decent returns to the farmer, the covering of necessary costs of transportation, processing and delivery, and the maintenance of an adequate and uninterrupted supply of wholesome milk for the public.

Price-cutting, which has as its motive or has as its results the destruction of the objectives set forth above, never permanently benefits the consumer, and results in distress for producers and chaos for the industry.

The most recent effort in this long search for a program of orderly milk marketing was the joint Federal and State Marketing Order, which became effective on September 1, 1938.

Borden's Farm Products and other divisions and units of The Borden Company were among the first to give their unqualified support to the Marketing Order once it had been promulgated by the Secretary of Agriculture of the United States and the Commissioner of Agriculture and Markets of New York State.

From the very beginning of the operation of this program until the last official act was written on March 14, 1939, Borden's gave the fullest measure of support to the efforts of Government officials to provide and maintain stability in the New York market, and Borden's pursued a course of conduct which constituted full compliance not only with the letter of the law, but also its spirit.

Almost immediately after September 1, 1938, *certain elements* in the industry began to pursue a policy aimed at the destruction of the effectiveness of the Federal and State Order.

Price-cutting started, litigation was instituted and, in general, these *certain elements* pursued a policy aimed at the

prevention of an orderly program of milk marketing.

The litigation resulted in an adverse decision, which was handed down on February 23, 1939. The Government proceeded immediately to appeal this decision.

Milk producers, in the hope that orderly marketing could be maintained pending this appeal, instituted a vigorous campaign, designed to obtain from milk distributors commitments to continue voluntarily to operate in accordance with the terms of the Order.

When this program was presented to milk distributors, The Borden Company was the very first distributor among all those in the market to pledge its willingness to accept the obligations of the Order on a voluntary basis—wholeheartedly and for all its units.

That campaign of milk producers failed, and one of the major reasons for its failure was the course of conduct of *these very elements* of the industry that had fought orderly marketing from the very beginning.

Secretary Wallace and Commissioner Noyes had no recourse but to suspend the operation of the Order. In his statement at that time Commissioner Noyes said—"The industry is now on its own."

The industry is on its own, at a time when milk production is higher than at any time during the past twenty years, at a time when milk products generally are selling at near the lowest prices in thirty years, and at a time when inventories of all manufactured dairy products are the highest on record.

For the next three months the industry is further faced with the seasonal rise in production, which in 1939 will be abnormally large because of the already high level of production. Orderly marketing is an absolute necessity if milk producers are to maintain satisfactory markets.

Two and one-half times as much milk will be produced in May and June as is needed for fluid milk. This surplus production must be manufactured into butter, cheese or evaporated milk.

Somebody must take care of this surplus production. Any dealer who shirks this responsibility creates for himself a tremendous price advantage in the marketing of fluid milk. Such dealers use this price advantage to tear down the market.

Borden's has never shirked the responsibility for surplus.

There is no milk distributor who can pay high classification prices and compete with the chiseler who buys his milk for fluid distribution at blended or surplus prices.

These circumstances—(1) the low level of basic milk values; (2) the abnormally high level of production; (3) the collapse of the program for orderly marketing—are the reasons for the price reductions made effective by this Company on last Sunday morning.

No sooner had these price reductions been announced than these same *certain elements* began to accuse this Company of price-cutting and to shed tears of compassion for milk producers.

These very people who are now bemoaning the fact that producers are going to get lower prices for milk are *the very ones* who kept from producers \$589,494.34 from September 1, 1938 to January 31, 1939—money that was legally due to producers through the Market Administrator. They are *the very ones* who failed to send in reports on February milk, which reports were due on March 10th, although the Order was not suspended until March 14th. They are *the very ones* who failed to make the legally required payments in January; in fact, some of them were delinquent from the very first month of the operation of the Order. They are *the very ones* that refused to give their support to the producers' campaign for voluntary continuance.

If there be any readers of this statement who doubt these facts, they can be easily verified by writing to the Market Administrator at 95 Madison Avenue, New York, N. Y., asking for a copy of his report dated March 14, 1939.

The price reduction made by Borden's was not price-cutting. It was an adjustment in prices necessary to meet the facts of the Industry—

They cut the price of milk!

WILLIAM H. MARCUSSEN, President

BORDEN'S FARM PRODUCTS
Division of The Borden Company

The Borden Company has always endeavored to make its products available to the public at the lowest prices consistent with (1) reasonable returns to producers, (2) the maintenance of a high standard of working conditions, (3) the maintenance of the highest quality in dairy products and (4) the maintenance of unfailing service to the public.

FIVE YEARS FOR \$3.00 — THREE YEARS FOR \$2.00 — PUBLISHED EVERY OTHER WEEK

BATAVIA Shows the Way!

Business Rallies to Support Agriculture

By E. R. EASTMAN

FULLY appreciating how dependent business men are on the income and success of farmers, the Chamber of Commerce of Batavia, N. Y., in cooperation with Buffalo and other western New York business men, started a movement destined to spread rapidly across the entire nation, which will be of untold value to agriculture and business.

In a few words, the purpose of this "Batavia Plan" is to unite the great influence and power of business:

First. In support of dairymen in their present fight for a living price for milk.

Second. In support of ALL farmers in their efforts to secure living prices for all farm products.

Immediately following the court decision against the Rogers-Allen law, and the failure to provide a voluntary milk marketing plan to replace this law, business men of Batavia, led by the Chamber of Commerce and the Batavia Daily News, began discussing what business men could do to help restore the milk marketing plan. Every issue of the News, day after day, carried feature articles showing how dependent is business on the success of agriculture, and also in every issue business concerns of Batavia placed advertisements like the following:

"Our best customers are the farm people of the Batavia territory. We are ready to give them every cooperation in the fight to maintain fair prices for milk."

And like this one:

"The headlines call it a farmers' battle, but the maintenance of fair prices for milk should be fought for by every business, professional or employed person in this agricultural community."

There were dozens of such advertisements.

The movement finally culminated in a great mass meeting of hundreds of business men and farmers, held in the high school auditorium at Batavia on Monday evening, March 27. At the conclusion of this meeting a resolution was unanimously adopted urging the New York State Legislature to pass without delay the Nunan-Allen Bill, which amends the Rogers-Allen law so as to meet objections made by Judge Bergan when he declared it unconstitutional. Also, it was announced that the Batavia Chamber of Commerce was communicating with every other Chamber of Commerce in the State, urging business men in every city

and town to inform themselves regarding the farm situation, and then to adopt a program of cooperation with and support of farmers.

With that kind of support, and with the proved ability to work together that farmers now have, *I am optimistic as to the future of dairying in particular and agriculture in general.* We have a few bad months ahead, to be sure, but certainly before the end of the summer, if dairymen will continue to stick together as they have during the past year, so that business men will have something to rally around, we will have the milk marketing plan restored and better prices again.

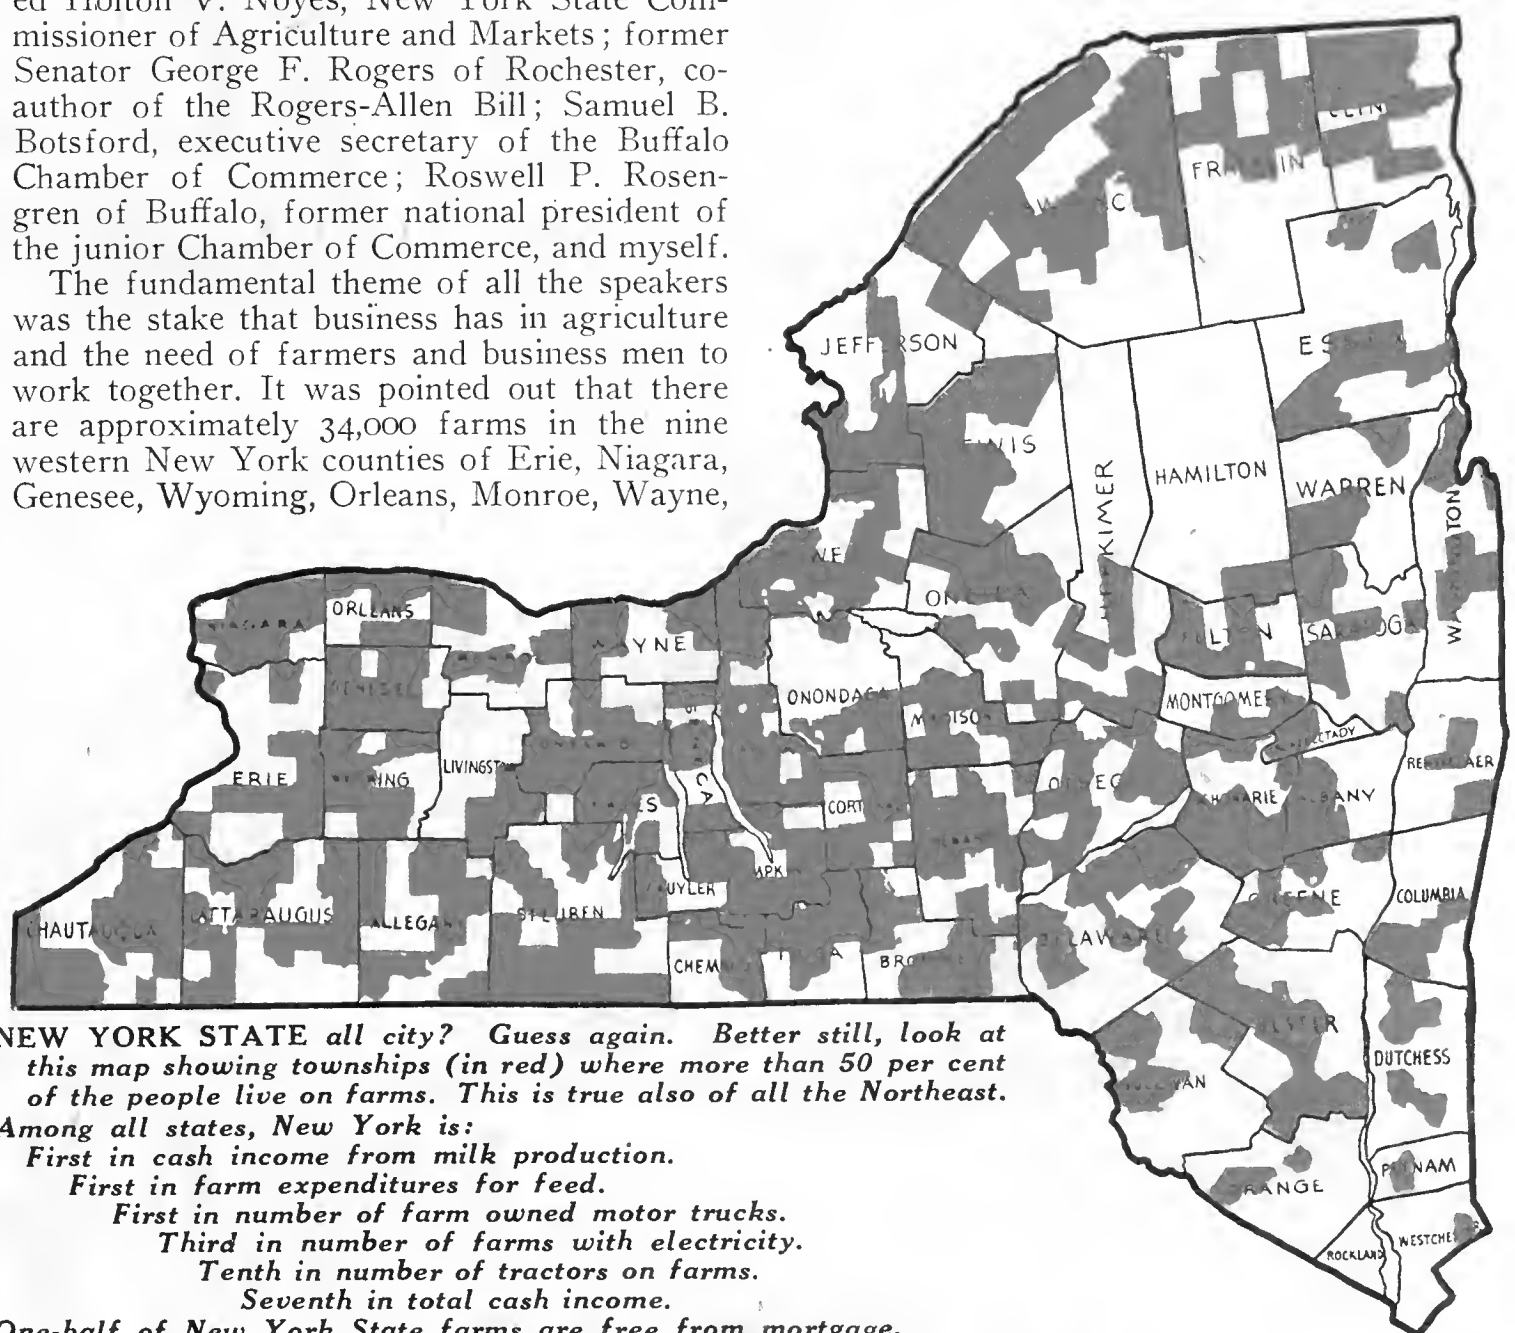

The speakers at the Batavia meeting included Holton V. Noyes, New York State Commissioner of Agriculture and Markets; former Senator George F. Rogers of Rochester, co-author of the Rogers-Allen Bill; Samuel B. Botsford, executive secretary of the Buffalo Chamber of Commerce; Roswell P. Rosengren of Buffalo, former national president of the junior Chamber of Commerce, and myself.

The fundamental theme of all the speakers was the stake that business has in agriculture and the need of farmers and business men to work together. It was pointed out that there are approximately 34,000 farms in the nine western New York counties of Erie, Niagara, Genesee, Wyoming, Orleans, Monroe, Wayne,

Ontario and Livingston. On those farms there are in round numbers, 152,000 dairy cows, producing 912,000 pounds of milk per year, returning to the dairymen of this district alone from \$15,000,000 to \$18,000,000 annually. Since the suspension of the milk marketing order, this income to farmers will be reduced fifty per cent or more in the next few months, resulting in a loss which every business man as well as every farmer will feel.

The total income of all farm products in western New York is in normal times at least \$50,000,000 a year. What other business or group of businesses returns so much cash to this section, and therefore is of so much benefit to every citizen? When you think of New York State as being entirely industrial, remember that it is seventh in the Union in farm income. New York, with other northeastern states, is one of the greatest farm sections of the world. The Northeast stood the farm depression better than any other section.

In my talk at this meeting, I pointed out how much the business (Turn to Page 23)

For Planting Hints — See Page 3; Soil Fertility Contest Winners — See Page 9.

CHARLES M. GARDNER
Editor of the National Grange
Monthly and High Priest of De-
meter of the National Grange.

REMARKABLE Grange progress in the state of Missouri the past few months has special interest to the Patrons of New York State, because of the new subordinate units organized. 17 of them are the work of National Deputy Clifford E. Rugg, long-time Grange worker in the Empire State and an active member of its deputy force. Besides these new subordinates, Deputy Rugg has been instrumental in organ-

izing new Pomona Granges in Missouri, and recently took the lead in the creation of a Grange Mutual Fire Insurance Company in Randolph County, Missouri. Deputy Rugg's success as an organizer for the Grange in several Midwest states the past five years has been very noteworthy.

THERE IS LOTS of excitement in the Grange at Dover, Mass., because of

the initiation into its membership of Governor L. B. Saltonstall and Mrs. Saltonstall as full-fledged members of the fraternity. The Governor was the honor guest at the Massachusetts State Grange session in Boston in December and was so impressed with what he saw that he immediately expressed a desire to join the organization. Governor Saltonstall, though a resident of the city of Newton, has a successful farm in the town of Dover and is keenly interested in all phases of agriculture.

DANIEL WEBSTER Grange in New Hampshire tackled a commendable project the past season in providing hot lunches for the children in one of the town's rural schools. The money was raised by whist parties, dances, etc. Besides necessary supplies for lunches,

American Agriculturist, April 15, 1939

quite an outlay was made by the Grange for dishes and other equipment. The whole town is loud in its praise of what the Grange has done for the youngsters.

EAST HADDAM Grange, No. 56, in Connecticut, is very proud of one of its charter members who signed the roll 52 years ago, and who has recently reached the 92nd milestone in life. He still retains his interest in the organization and at the last anniversary he was present and gave interesting reminiscences.

NEW JERSEY Grange contest for the best work done during the past season along home economics lines aroused state-wide interest. First prize went to Harrisonville, No. 26; second, Delaware Valley, No. 143; third, Woodstown, No. 9; fourth, Columbus, No. 58. For the 1939 contest, to be conducted along similar lines, one of the principal topics will be "The Family Budget."

BETHLEHEM GRANGE, No. 137, Albany County, N. Y., celebrated its 65th birthday on the evening of March 25. It is one of the few subordinates in the Empire State to attain that distinction. One of the original charter members is still living, but because of poor health was unable to attend the exercises.

MASSACHUSETTS Granges are looking forward to their annual state-wide Bird Day, conducted under the sponsorship of the conservation and bird committee of the state organization. This is scheduled for May 20th at Williamsburg in Hampshire County, and is expected to attract bird lovers from all parts of the state. Former State Master H. N. Jenks of Cheshire is chairman of the State Grange bird committee.

BEACON GRANGE, Connecticut, had a merry evening when a "snow festival" was featured, and one of the members wrote a jolly skit, "Going Sporting," which was a great hit. The evening came to a fitting climax with a genuine old-fashioned "sugaring off" party, which was a novelty to many of the members.

IN MASSACHUSETTS a Grange hall dedication expected to draw a record attendance is due Thursday evening, May 18, when Bradford Grange in Essex County will dedicate its new home, one of the best Grange properties in the Bay State. A new Grange in Massachusetts was organized March 28, with 72 charter members, at Russell in Hampden County. Several new Juvenile units in the Bay State are already in process of completion.

TOMPKINS COUNTY, N. Y., Pomona Grange celebrated its 35th anniversary March 18. Several charter members and Past Masters were present.

(Continued on Page 18)

A FARM COUNTRY FAVORITE — AND NO WONDER!

**LOWEST
PRICE**

In this year's 350-mile Gilmore-Yosemite Economy Run, best gas mileage among leading low-priced cars was given by 85 h.p. Ford V-8. Ford owners also report oil seldom, if ever, added between changes. Every Ford owner gets famous low Ford upkeep and repair costs.

\$584 DELIVERED IN
DETROIT
EQUIPMENT INCLUDED
State and federal taxes extra, for the 60 h.p. Ford V-8 Coupe. Lowest price for any 1939 car with more than 4 cylinders, and includes bumpers and 4 bumper guards; spare wheel, tire, tube and lock; cigar lighter; twin air-electric horns; dual windshield wipers; sun visor; foot control for headlight beams with indicator on instrument panel.

**BEST
ECONOMY**

Among all leading low-priced cars this year, Ford V-8 has . . . *Biggest* hydraulic brakes; *longest* ridebase; *only* V-8 engines; *only* ride-stabilizing chassis combining transverse springs, 4 radius rods and solid front axle; most advanced styling; *only* windshields that open on closed models, *most* equipment at no extra cost!

**MOST
IMPORTANT FEATURES**

THIS IS THE YEAR TO GO
FORD V-8
EXCELS IN THE THINGS THAT COUNT!

"I'M GOIN' TO THE FAIR FOR A FEW DAYS, PAW—ADD A LITTLE WATER TO THE SOUP ABOUT THURSDAY IF YOU DON'T LIKE IT TOO THICK."

Legumes LIKE LIME

LIME is no substitute for fertilizer or manure, but it is equally true that for many crops full results of fertilizer cannot be secured on a soil that lacks lime.

Probably lime is most commonly added to fields where small grains are to be grown as a nurse crop to grass. The logical procedure is first to get a lime requirement test, which most Farm Bureaus are equipped to give. In general a ton of limestone or its equivalent is needed every 4 to 6 years on soil where alfalfa or clover are grown.

As shown in the illustration, a spreader attached to the rear end of a truck provides an easy method of spreading. Another quick means is a

manure spreader equipped with a lime spreading attachment. It is also possible to spread limestone over a load of manure in an amount which will add the approximate amount of lime needed per acre.

While mixing with the soil will give quickest results, the lime can be profitably broadcast on permanent pastures. If sufficient phosphorus is also supplied, clover will grow on soil that is quite acid.

The finer the limestone is ground, the more rapid will be its effect. A common rule is that a sample should pass through a screen with 10 meshes to the inch, that 95 per cent of it should pass through a 20-mesh screen, and 50 per cent through a 100-mesh screen.

Time to KILL WEEDS

THE BEST time to kill weeds is before the crop is planted. As is evident in the picture, rain has fallen on this field since it was previously cultivated. If you could examine the soil carefully, you would find that close contact with moist soil has resulted in the sprouting of millions of weed seeds. Harrowing kills them and makes

that much less work for a cultivator or a hoe later in the season.

The next best time to kill weeds is after the crop is planted but before it is up. A harrow or weeder will kill weeds when they are young, with benefit instead of injury to the crop. Deep cultivation to kill weeds after the weeds get a good start is likely to break off the feeding rootlets of the crop.

ASPARAGUS for Home Gardens

ASPARAGUS is by no means a difficult crop to grow. Yet it is frequently absent from the home garden. One hundred plants of this early season crop with its vitamins and appetizing flavor will supply an average family.

It does well on a warm, well-drained soil, well supplied with organic matter. One year old plants are advised set 6" to 8" deep from 18" to 24"

apart in the row, and with rows 6' to 8' apart. After the plants are set, cover them with 2" or 3" of soil, and then fill in the trench as the plants develop.

Contrary to a general idea, the use of salt to control weeds after the bed has been established is not very effective. Weeds can be controlled by discing the field early in the spring before growth starts, and by following this with frequent cultivation between the rows.

If a commercial fertilizer is used, it is a good time to apply it before the field is disced.

Once started, an asparagus bed is good for 15 years.

OAT SMUT Out of Style

WITH seed treating so simple, there is little excuse for oat smut losses. An easy way to treat oats is to use 40 per cent formalin and water, mixing half and half in a small hand sprayer. As one man shovels the seed oats from one pile to another, his partner gives one or two pumps to the sprayer handle as each shovelful is added to the pile.

When you have finished, cover the pile with a canvas or with damp bags to keep in the fumes until the next day, or until you are ready to sow. A pint of formalin will treat 30 bushels of oats.

Another excellent way to treat oats is with new improved Ceresan, a commercial dust made for that purpose. Home-made equipment is easy to make for treating seed. A bushel of oats can be treated for 2c.

While less commonly done, there is also much evidence to show that treating seed corn with a commercial dust pays dividends. This is especially true when cold, wet weather follows planting. A better stand results which in turn makes for a better yield.

SOY BEANS Need INOCULATION

SOY beans respond to the application of fertilizer and lime, yet they will grow better than most legumes on soil somewhat lacking in plant food and lime. For satisfactory results, soy beans must be inoculated unless bacteria are already present in the soil. In fact, the cost of inoculation is so low that it is recommended as a form of insurance.

Most states now have laws requiring that commercial inoculants be tested and labelled, and these commercial inoculants are uniformly good. Directions for use are found on each package.

The soy bean is a warm weather plant, and is put in the ground just after corn planting time. Weeds must be controlled, especially early in the season. Young soy bean plants cannot compete with weeds. For that reason some growers prefer to plant soy beans

Paul Rice inoculating soy beans on the Egg and Apple Farm, Trumansburg, New York.

in a row so the crop can be cultivated. If drilled solid, use of a harrow, rotary hoe, or weeder at an early time will control weeds. Even if the harrowing seems to be ruining the crop, keep it up. Soy beans can take a lot of punishment from a harrow.

Crooked but Level

THE man who planted these potatoes was not asleep. He purposely laid out the rows to follow the contour lines of the field to lessen soil loss by erosion. Actual tests have shown

that this contour planting increases yield. The reason is that moisture soaks into the ground instead of running off. More and more farmers are realizing seriousness of erosion losses and are taking steps to control them.

How Farmers' Enemies Work

ONE MORNING recently, when Mrs. Milk Consumer of the city of Buffalo went to take in her morning milk, she found the following notice slipped over the top of the bottle:

IMPORTANT To the Consumer

The NUNAN-ALLEN BILL now before the legislature is detrimental to you as a consumer of milk. We, therefore, have prepared the attached card for your expression of protest. Please sign and hand to your route salesman TODAY. No postage required.

Attached was a postcard where the consumer could sign her name and address, which read:

POST CARD

The undersigned voter in your district requests you to oppose the NUNAN-ALLEN BILL, now before the Legislature. This bill is unfair to all consumers of milk and dairy products.

The route salesmen picked these up and forwarded them to the consumers' Buffalo representatives in the Senate and Assembly of the New York State Legislature.

The Nunan-Allen Bill, as you know, is the old Rogers-Allen Bill amended to meet the objections of Judge Bergan. Working hand in glove with these destructive milk dealers who are getting consumers to send in these cards are other members of the anti-farm gang, who are leaving no stone unturned to defeat the Nunan-Allen Bill, and thereby any hope the dairyman has for the restoration of a milk marketing plan which will bring living prices.

This anti-farm gang, consisting of a farm paper publisher, a few lawyers, a few politicians, and a lot of price chiselling milk dealers, is solely responsible for the failure of the voluntary agreement which would have restored the milk marketing plan that gave farmers better prices during the past few months. I hope this gang is proud of its work.

All hope of restoring a satisfactory milk marketing plan rests on **your** ability as farmers to believe in and to work with your friends and to resist the selfish evil influences that are interested only in keeping you divided. The anti-farm gang is carrying on a whispering and a talking-out-loud campaign of lies and misrepresentations, telling you that your neighbor or your neighbor's organization is your enemy, that the other fellow's organization is responsible for the crash in prices, that there was no need of reducing prices, that the leaders of your neighbor's organizations have sold you out, or are drawing down tremendous salaries while farmers suffer.

Why sensible farmers continue to believe this stuff is absolutely beyond me. When they tell you, for example, that you should help defeat the Nunan-Allen Bill, remember the placard shown above which the chiselling dealers put on the milk bottles of the consumers in Buffalo. When they tell you that the milk bargaining agency consists of a bunch of crooks, remember that it was this agency that supported the Rogers-Allen Law and the Federal Marketing Agreement which gave you, while they were in effect, a living price for milk. Remember to compare the prices you received while those agreements were in effect with what you are getting now, and then tell me where your interests lie—with the anti-farm gang, or with your neighbor even though that neighbor may belong to a different marketing organization than your own.

I wish there was language to express how strongly I feel in this matter, how sure I am that we must all keep from rocking the boat, that we

must all keep our faith in our neighbors and try to practice as well as preach the real spirit of cooperation, team work, and brotherly love. If we do, I know that we are going to be able to restore some kind of a milk marketing price plan in a few months that will change this whole bad picture.

Want a Good Lawn?

THE welcome sound of the lawnmower is beginning to be heard again in the land. When I was a youngster there were only one or two farm lawns where a lawnmower was used all up and down the whole long valley. Today most farm folks find time, no matter how busy they are, to try to keep a good lawn.

Mowing the lawn at the right time has much to do with its beauty. Nearly everybody cuts the lawn too close. Every farmer knows that a healthy plant needs a good root system, and that much of the health of the plant depends upon its leaves, which are exposed to sun and air. If those leaves are constantly clipped too close, the plant never has a chance to feed itself. Here are some rules for lawn care which will help you to keep a good lawn:

1. Don't be in a hurry to cut the grass the first time in the spring. Give it a chance to make some new growth.
2. Never cut the grass too close. Nearly everybody does. The proper length is $1\frac{1}{2}$ " to 2". Adjust your mower to cut it this height, and above all, keep your mower sharp so that it cuts the leaves without bruising them.
3. Heavy clippings mat down and injure a lawn. Take them off.
4. Let the lawn grow in the fall so it will have at least 2" or 3" growth before winter. In other words, stop mowing early.

"No Time to Fool With a Garden"

SAID a farmer friend to me recently: "I haven't time to fool with the garden. I can buy all the vegetables I need cheaper than I can grow them."

I didn't say it to him, but I felt like asking him, what with? Farmers' chief difficulty right now is to get cash. Home-grown supplies require no cash.

We crowd into commercial production every last acre, and we add more and more cows, only to increase the surplus of everything, lower the price, and make it necessary to work all the harder to grow more crops and produce more milk and more surplus.

While we do this, we sell at starvation wholesale prices a lot of the stuff that we could produce on our own farm. I am not saying that we ought to go all the way back to the ways of our fathers, but we wouldn't need so much cash if we raised more of the stuff our families use, and we'd live better while we were doing it. After all, farming is a way of life.

One way to begin is to start right now to plan the best garden your old farm has ever seen.

Has Read A.A. for 55 Years

"My first employer told me that if there were any papers that would help me, he would subscribe for them. My seedsman showed me a few, and I picked *American Agriculturist*. That was 55 years ago next March, and I have enjoyed it ever since."

—J. D., N. Y.

I SELDOM go to a meeting that several people don't tell me how much they like *American Agriculturist*. Such appreciation is always encouraging, of course, but it always makes all of

us on the staff feel humble, and renews our determination to make the paper more and more interesting and helpful.

You in turn can help us do a better job by turning to our advertising columns when you want to buy something, and by saying either to your local dealer or in your letter to an advertiser, "I saw your product advertised in *American Agriculturist*."

The Morning Glory

Was it worth while to paint so fair
Thy every leaf—to vein with faultless art
Each petal, taking the boon light and air
Of summer so to heart?

To bring thy beauty unto perfect flower,
Then, like a passing fragrance or a smile,
Vanish away, beyond recovery's power—
Was it, frail bloom, worth while?

Thy silence answers: "Life was mine!
And I, who pass without regret or grief,
Have cared the more to make my moment **fine**,
Because it was so brief.

"In its first radiance I have seen
The sun!—why tarry then 'till comes the night?
I go my way, content that I have been
Part of the morning light!"

—Florence Earle Coates.

IN ALL of your hurry with the spring work, take time to spade a few feet of ground in a sunny spot next to your porch or the wall of the house and sow a few morning glory seeds, or some other old-fashioned flowers which grandmother used to love so well, and reap your reward not in dollars, but in the lift of the spirit every time you see the lovely blossoms.

Too busy, say you? Are you too busy to take time to live?

"The Sower Went Forth to Sow"

IN GOOD times or bad, war or peace, even in times of sickness and sorrow, the seasonal work of the farm must go forward, seed must be sown, the crops cared for and harvested.

That is the reason why you will find each issue of *American Agriculturist* right now during this planting time crammed full with the latest and best information on how to get the crops into the ground, the chicks or the young stock raised for the best results with the least labor and cost.

It costs us much time and money to get this information and boil it down; it will only take a little of your time to read it.

Eastman's Chestnut

WHENEVER I go to New York I always find time for at least a short visit with my friend, Dr. E. R. Eaton, who has had such marvelous results in helping people afflicted with arthritis. Dr. Eaton is not only a great physician; he is a philosopher and humorist. Knowing that I like chestnuts, he always saves up a good one to tell me. Here is his latest:

A graduate of Cornell was out of a job and answered an advertisement. He was told that the job was all right but that it probably wasn't good enough for a college man. It consisted of putting on a bear skin and acting as a playful bear in a circus. The college man said he had to eat and he'd take the job. He was a huge success and kept the crowd in stitches. Finally he got to performing on a trapeze, thought he was a little better than he really was, and fell off, landing in a lion's den in the circus ring below.

The fall shook him, but he got quickly to his feet and began circling around toward the door. Then the lions got between him and the door, and shortly after began to rough him up. He had taken about all he could, so he started to yell for help. Whereupon one of the lions said to him:

"Shut up, you darn fool! Do you think you are the only Cornell man out of a job?"

Apples or Oranges?

HAVE been reading up on the apple situation in your paper.

Apples as I knew them almost 70 years ago, here on Long Island are almost an unknown quantity. One could go into an orchard and taste and smell the fruit of delicious quality, or so we thought then, spicy and sweet. When we read of *old* trees that your writers tell about they were young then. We had a Russett that was torn out by the September hurricane that was set before 1820, and how much before we don't know. My grandfather came into possession of our place April 1, 1825. Now we have to buy our apples, or go without, and believe me, we have to pay for them or get inferior stuff.

If we could get good eating apples it would seem that Long Island with its about 4 million people could take care of all N. Y. state raises. Reckoning the crop at 16 million bushels would only give each person 4 bu. per year, and am sure our family could take care of our part. But we find it hard to get a satisfactory deal and for that reason we are buying oranges.

Why is it that we can't get Roxbury russet now? Used to have them of our own raising until corn planting time or in May. Peck's Pleasant was another good kind that a neighbor raised. Would like to know what kinds of fruit grew from the seed that Johnny Appleseed planted in so many places. Wild apples are worthless here.—S. W. S., N. Y.

Dairymen Will Win the War

AS A DAIRY farmer I must write to show my appreciation for the untiring efforts of you and your paper to help secure a "living price" for milk. I doubly appreciate it knowing that you in a general way are opposed to government regulation. Nevertheless, you supported the Federal order from the start because you realized that order was necessary to control interstate milk, and because you realized that it was imperative that something be done to save the dairy industry.

The constructive forces in the dairy

Your Page

Of Letters About The Dairy Situation, Milk Testing, Apples and Oranges, and Other Thoughts.

industry have recently been dealt a hard blow or a series of hard blows. But only blows, not defeat. Through the Federal order more dairymen have worked hand in hand for a common cause than ever before, and with the finest unselfish spirit.

I firmly believe that this greater co-operation and understanding will eventually produce complete harmony among producers. You have taken no small part in securing this greater co-operation, and I am sure all right-minded dairymen are grateful to you.

It is lamentable and pathetic that in a country where the majority is supposed to rule, a small minority of dealers and misinformed producers with the help of a farm (?) paper publisher was able to defeat a constructive and fair plan that had already put millions of dollars in dairymen's pockets. It seems inconceivable that many otherwise progressive and intelligent farmers would support such a destructive bloc.

However, we have lost one skirmish but not the war. We discovered last September what can be accomplished by eighty or eighty-five per cent working together. Dare we hope that the success of last fall might show the other fifteen per cent what might be accomplished by working together 100 per cent?

Yours in appreciation,

—J. E. D., New York.

Says Go Back to 3% Standard

I SAW your page in the *American Agriculturist* under the name "Are farmers being cheated on butterfat test?" I think you are getting down to business end of the milk business, for the farmers are being cheated out of thousands of dollars a year, for I am one of them with only a small dairy. I have lost enough to pay the cost of trucking the milk. I will explain how it is done.

They take the test every day and put it in the test bottle, and if the farmer's test runs 3.9% they add enough skim milk to bring the test down to what they give the farmer. I will explain how the farmer can be beat on the weight of his milk. If he has full cans it cannot be worked but if he has 2 cans and 25 quarts over it can be worked. He will get paid for 2 cans fifteen quarts and that is the way they work it. This is not much on one farmer, but on 4 or 6 hundred farmers it is a whole lot be-

tween the test and the weight that they gyp the farmer. They undercut the honest dealer at the farmer's expense.

I don't say that they all do it, but there is enough of it done so it hurts the milk market plenty and the honest dealer will agree with me on that point. Here is how it can be stopped. Change the butterfat test from 3.5% to 3.0% and pay .02 cents a point instead of .04 cts. over and above 3.0%; they would not dare give the farmer under 3.00% for he would have skim milk. And take the weight, make each plant give a weigh slip on every farmer's milk each morning delivery and he will have a record of his milk.

—K. G., New York.

Norway Readers Like A.A.

I DERIVE very much pleasure and information from your paper. I am sending your paper to two relatives in Norway. They also write they find it most interesting. One also subscribes to English and German agricultural papers, but enjoys yours the most.

—P. A. L., New York.

* * *

"Every time we wish to make a purchase of some new thing for the farm, we look over the *Agriculturist* advertisements and usually send for literature concerning it. Sometimes this results in a purchase. Sometimes it just helps us to learn what we will want when financial conditions are better. In the case of seed and cook books, it helps to make better planned meals and gardens besides giving me a lot of fun."—E. A. P., New York.

NOTE: The *American Agriculturist* is your paper. Help it along by buying your needs from A.A. advertisers. Mention A.A. when you write advertisers.

This smiling group forgot care and went on the American Agriculturist Tour to the Northwest, the San Francisco World's Fair, and the Grand Canyon of Arizona. This picture was taken at San Francisco on March 7. Kneeling in front is Verne BeDell of the Northern Pacific Railway who escorted the Tour.

Inquiries are now pouring in for American Agriculturist's first European Tour, which leaves Montreal on July 28; will visit Scotland, England, Belgium, Holland, Germany, Switzerland and France; and will be back on August 24. If you would like full information about the trip drop a post card to European Tour Editor, American Agriculturist, Box 367, Ithaca, N. Y.

APPLE BILL Says: "Micro-Spray* Sulfur is as fine as Frog Fuzz"

The effectiveness of sulfur as a fungicide is in direct proportion to the size of the particles. The finer the particles, the more sulfur surface exposed, and the more sulfur vapors freed in a given period. It has also been demonstrated that particle fineness further increases the efficiency of the fungicide by improving its spreading and sticking qualities.

MICRO-SPRAY* SULFUR is the finest micro-type sulfur made for commercial sprays. Its particle size exposes a maximum of sulfur surface. This assures high fungicidal activity and superior sticking qualities. Its properly adjusted wetting agent produces rapid dispersion in the spray tank and smooth filming on fruit and foliage.

Micro-Spray Sulfur is used on apple trees in pre-bloom sprays to prevent early scab infection. In cover sprays, it protects against late scab without interfering with foliage development or finish and color of fruit. It reduces hazard of injury to fruit and foliage that often results from the use of lime sulfur.

Why APPLE TREES Do Not Bear

A crop of quality apples is not an accident. When a tree fails to bear, there is a definite reason, although the reason may be difficult to determine.

WHEN apple trees fail to bear a satisfactory crop, any one of several conditions may be the cause. You as a fruit grower are best able to determine the cause and to plan the best treatment for the orchard.

Temperature and weather conditions have their effects, particularly during the blooming period. It has been found that there is very little germination of pollen at a temperature below 40° to 42° F., and if these temperatures prevail during most of the blooming period, the set is likely to be small even though there is no actual freezing of the flower parts.

A heavy, beating rain immediately after blossoms open is also unfavorable to pollination, it being claimed that under these conditions much of the pollen may be washed away.

A less obvious reason for a poor set is that low temperatures during the winter may have destroyed the central parts of the flower in many buds. These buds may open and appear normal, and the damage is only observed by close examination of the central flower parts.

Low temperatures during the blossoming season have another indirect effect in that bees do not fly when the temperature drops to about 42°, or during high winds.

The effect of cross pollination is realized much more fully than it was a few years ago. The old farm orchard usually had a number of varieties. Then came a period when orchardists were advised to plant fewer varieties, the result being that many solid blocks were set out. If the variety was one that is self-sterile or self-unfruitful, the result was a poor crop. This situation has been remedied in some cases by top-working some trees into good pollenizing varieties. In others, branches containing blossoms from a good pollinizer are placed in buckets containing water throughout the orchard to provide for cross pollination. When self-sterile varieties are planted, it is recommended that every third tree in every third row should be a variety suitable for pollinating the main crop.

If weather conditions are such that bees do not fly freely, this bouquet method does not, of course, get results. In such cases, a few orchardists have tried hand pollinating with success. Naturally, the chief objection is the labor cost involved.

Less understood as a cause of poor set is the nutritional condition of the tree. It is generally admitted that both over vigorous trees and those lacking in vigor are not in a favorable condition for the formation of fruit buds. Trees low in vigor need fertilizing to increase the crop. Where apple trees blossom freely but set little fruit, even when other conditions are favorable, the cause may be an inadequate supply of nitrogen during the blossoming period. In such cases 4 or 5 lbs. of a nitrogen carrier per tree, applied just as the buds begin to swell, is likely to increase the crop.

Pruning is closely connected with the nutritional condition of the tree. Pruning a mature apple tree in reasonably satisfactory bearing condition may throw the nutritional condition out of

balance so that production will be decreased for several years. On the other hand, old trees lacking in vigor may be stimulated by judicious pruning. The tendency seems to be to over-prune rather than to prune too lightly.

The principal other reasons why fruit trees fail to bear are insects and diseases. Merely to ask a scientist why your trees are not bearing is likely to bring a non-committal answer. To determine which of the reasons given applies in any particular case requires a rather intimate knowledge of the past history of the orchard.

Mulching Orchards

THERE are a number of reasons for the trend toward mulching apple trees. Where orchards on sidehills are cultivated, heavy rainfall carries off a considerable amount of soil. Mulching stops this loss. Closely connected with this is the question of moisture control. A mulch prevents run-off and allows the moisture to soak into the ground where it can be used by the trees.

In orchards good soil aeration and tilth is important. It has been found that the soil under a mulch develops an exceptionally good tilth. Water has difficulty in penetrating soils that become puddled or compacted, a condition which frequently follows the use of heavy spraying machinery at a time when the soil is too wet. Mulching apple trees offers excellent protection to roots during low winter temperatures.

Some growers have felt that mulching encourages the roots to develop close to the surface. However, the Ohio Experiment Station says that mulch favors BOTH extensive surface rooting and deep rooting so that the tree which is mulched really has a better root system.

The soil under mulch is cooler during hot weather and warmer during cold weather. This tends to slow down slightly the development of nitrates in the soil early in the season and to increase it later in the season. This gives the leaves a supply of nitrogen later in the summer and is likely to mean a larger storage of food reserves in the tree.

Perhaps the two principal disadvantages of the mulch system are the cost of mulch material and the increased danger from mice. Some growers feel that they can afford to pay as much as \$6 or \$7 a ton for mulching material. Unquestionably mice favor an orchard that is mulched, but, regardless of the system used it is necessary in most cases to use poison bait for mouse control, and there is plenty of evidence that where the job is done right, mice can be controlled in a mulched orchard.

"POWERS' FOLLY"

Defies the Years

By HAL VON LINDEN

DIPPING swallows nest in the trough of its eaves, moss creeps along its sturdy beams, truant boys fish from its abutments, and willows weave their slender shafts across the disused entrance of the longest single-span wooden covered bridge in the world—"Powers' Folly", as once was dubbed the old Blenheim bridge that spans the Schoharie creek at the northern outskirts of the little old-fashioned village of Blenheim as it wanders for a space in the hills of the upper valley at the southern tier of Schoharie County.

The burghers of Blenheim Patent had, for long before the township was formed on March 17, 1797, forded the waters of the winding Schoharie at the end of the village. In 1828 the village forefathers had passed an act to incorporate the Blenheim Bridge Company. This original charter, which expired in 1857, was, through petition of William Fink and George W. Marin of Blenheim, extended by the board of supervisors for a period of three additional years.

That same year a stock company began the erection of a covered wooden bridge that was typical of its era. The work went forward under the architectural and engineering supervision of one Nicholas Powers, of whom history has written nothing save that he was from Connecticut.

Block to block the rugged piers took form, and in the northernmost one today, say the old legends of Blenheim town, there is sealed a flask of whisky placed there as a ceremonial of the christening, to ward off the evils of dry rot and to insure the long life of the structure.

FROM the wooded hills of Blenheim came the hand hewn stringers upon which arose the superstructure. Throughout, the bridge is built entirely of oaken planks in a design that even today commands far-reaching interest in the circles of modern structural engineering.

Each plank and strut is joined and secured by oaken pins, not so much as a single nail having been used anywhere in the entire design save for the fixing of the original shingles to the roof boards. The bridge is 231 feet long and retains through its covered length a partition which equally divides its width of 30 feet.

The summer of 1857 bore on and the forefathers of Patchins Hollow, as Blenheim was known in the preceding

century, gathered at the inn to scoff, over white capped brew, at the timbers then rising methodically and to laugh with scorn at the folly of a man who dared believe that he could fling across the sullen waters of the river a span that would hold even its own weight without a center sustaining pier.

Summer slipped into the gossamer, haze-rimmed days of autumn before was driven the final pin of "Powers' Folly".

The day of dedication came. From miles in every direction had come the hill folk, some of them had indeed driven to the hamlet a full day previous that they might miss nothing of the festivities that were taking place. The river banks were thronged with the multitudes while laborers attacked the key beams that would drop the falsework to the black water beneath. Straining timbers cracked agonizingly in the last seconds during which an agile figure was seen to appear on the bridge and to clamber swiftly upward through the interwoven timbers to the purline plates and upward to the peak of the king-post gabled roof at its center.

FOR throughout the season of its building the undertones of skepticism had rankled in the soul of Architect Powers who had seized this taut moment to display the faith of his work. Jacket billowing in the wind, he waved his hat at the staring crowd and historians recall his words to those releasing the false work beneath him.

"Knock it away, boys; if she goes I'll go with her." A final blow sounded and its echo was flung back from the wooded hills, the underpinning trembled, splintered and tottered slowly into the river.

Tightening joints murmured and were still, the structure settled the fraction of an inch.

During the intervening 81 years it has not settled further, notwithstanding its weathered exposure and the passing over it of the loads of four generations. Nor will it settle, modern engineers hazard, an inch in the next 100 years to come.

It was in 1921 that it was supplanted by a modern truss of steel girders, and it has since been relegated for care and preservation to the board of supervisors of Schoharie County, as a relic of an era of memories and across which no more will rumble the loaded wagons of the settlers on their way down valley to mill and mart.

MORE ACRES PER GALLON!

150-HOUR VEEDOL

"A Better Tractor Oil by the Clock"

SCIENCE, in its constant effort to help the American farmer increase his yield per acre and decrease his cost, continues to introduce new machines, new methods and new materials.

Such a contribution is offered to you in 150-Hour Veedol tractor oil by Tide Water Associated Oil Company . . . for 61 years a leader in the petroleum industry. This new Veedol is refined exclusively from the finest of pure Bradford-Pennsylvania crude oil.

150-Hour Veedol is fast displacing old-time 60- and 75-hour oils in modern gasoline-driven tractors. Even in distillate-burning tractors, owners report more acres covered with fewer gallons.

But the major economies of 150-Hour Veedol come from a more dependable motor, protected hour after hour against costly delays and repairs due to lubrication failure. A trial 5-gallon pail of Veedol will demonstrate why it's called "a better tractor oil by the clock."

150-HOUR VEEDOL cuts costs these 5 ways in your gasoline tractor

1. **Saves Fuel** . . . Reduces power "blow-by", minimizes dilution . . . thus **saves fuel** consumption.
2. **Saves Oil** . . . In many cases **doubles** operating hours between oil refills.
3. **Saves Losses** . . . Ends time and money losses from needless breakdowns.
4. **Saves Repairs** . . . Greater resistance to heat and friction cuts costly tractor repairs.
5. **Saves Tractors** . . . By reducing wear, assures long, economical tractor life.

There is a Veedol lubricant for every make of truck and passenger car! These Veedol Oils are made 100% from Bradford-Pennsylvania crude. Veedol greases and gear lubricants meet all modern conditions. All Veedol products are made by the makers of the famous Tydol Gasolines.

DIBBLE'S FARM SEEDS

**Alfalfa - Grass Seed - Corn - Soy Beans
Clover - Oats - Barley - Seed Potatoes**

In 1938 many varieties—including sweet clover, alsike, barley and alfalfa—showed productions even greater than in 1937. But big production doesn't mean QUALITY. Nor does it mean the hardy, acclimated seed you need. It does mean that— with lower prices—no one should be deprived of the best quality obtainable—Dibble quality!

Avoid seed of unknown origin. All Dibble seeds are of known origin and all are northern grown.

Hardy, northern grown Alfalfa is limited in quantity this year. Choice Seed Oats are in demand. Good seed potatoes are scarce—need watching. We have excellent stocks of all of these as well as other seeds.

Take advantage of our knowledge of farm seeds, based on years of intensive testing and proving on our 1000 acre experimental farm. You can't lose with our "10-day-any-test-you-want" guarantee behind every bushel we sell.

DIBBLE'S HEAVYWEIGHT OATS—most productive American oat, 40-42 pounds per bushel. Avoid untried sources.

DIBBLE'S SEED CORN—All leading varieties 95% germination or better. Test it yourself.

One quality only—THE BEST. Prices less than you'd expect for such Quality. Get the DIBBLE catalog and Prices FREE. Send name and address on a 1c postcard.

Packages for Lettuce

By PAUL WORK

REPRESENTATIVES from the different sections that expect to ship Iceberg lettuce this summer ought to get together and agree upon a standard package, or upon 2 or 3 if more than one is needed. Otherwise we are headed for the same confusion that has developed with our celery crates.

Paul Work

The Los Angeles lettuce crate is pretty large for practical purposes, for the 5 dozen is a pretty heavy order for many small stores— independent and chain, — and the thing is clumsy and heavy to handle. The old New York 2-dozen lettuce crate as used for Boston is a bit small. It would seem reasonable that a crate to carry two dozen good heads of Iceberg might well be adopted. A single specification might easily be sufficient and if lettuce is a little small, the heads might be packed 15 in a layer instead of 12. Consideration will need to be given to liners of paper and to package icing.

Market gardeners around New York City have for years been using 32-quart berry crates for most kinds of green and bunched vegetables. The crates go back and forth until they are black and broken. Some of the gardeners are getting tired of this system. They want something that will handle bunched vegetables nicely and also lettuce. It is entirely possible that the same crate would do for this situation and for the Iceberg lettuce.

The more uses there can be for a single crate, the larger the quantities that can be produced and the lower is likely to be the cost of production.

Temperature

Two Long Island gardeners called on me Farm and Home Week to inquire about the possibilities of cold storage rooms for temporary holding of vegetables and particularly for precooling. One of the surprising things about their conversation was their inquiry about precooling cabbage. It seems that the tender early product, in hot weather, will become slimy even over night.

Precooling is no panacea and half-way methods are likely to be misleading as to the results and returns. At the same time, new attention to holding suitable temperature for vegetables is justified, and this will come to be as much a part of the game as with meat and other supposedly more perishable products.

Watermelons Will Not Down

Every once in awhile we get a letter about watermelons being as early as muskmelons. The 1938 season was not particularly good for muskmelons, either for maturing them or for quality, but in spite of those conditions, watermelons seem to have done pretty well. I have had several reports of people who did not get their muskmelons to ripen at all but who had watermelons in nice shape.

One of the fine things about watermelons is that besides being good to eat they are lots of fun. Nothing quite like them for a hot weather picnic. Of course they want to be picked a day ahead and thoroughly cooled.

Watermelons do not require very much in the way of special treatment. They do better on the lighter soils than

on heavy soils but otherwise are handled in about the same way as the other vine crops giving them, of course, wider spacing than is usual for muskmelons or cucumbers. They seem to be a little less subject to insect and disease damage than the other cucurbits.

They certainly make a fine roadside feature. People say that people are all fed up on Southern watermelons by the time ours come along. That principle does not seem to apply to our good New York peaches, and our watermelons are pretty good, too.

Perhaps the most ticklish point in the process is learning to harvest them. This varies a bit for different varieties and skill is largely a matter of practice.

Carpe Diem

In the old days when every class had to have not only its colors and its class flower but also a Latin motto, "Carpe Diem" was one of the standards. When the kids got interested enough to ask the teacher what it meant, she would tell them "Seize the Day!" If that was a good motto for Julius Caesar on campaign, or for Cicero in the Forum, certainly it is a good one for the gardener of today—be he commercial or home. Every once in awhile there is a single half day—say from noon until it begins raining about supper time—when ground can be prepared and seeds can be planted. The fellow who is able to muster a force of workers and get some things planted is likely to be definitely ahead. Of course, that does not always follow. Sometimes things that are planted a week or two later will be just as far along. Sometimes, also, early plantings will bring as good a price as first early. It is still true, however, that people like to get the first home grown stuff and are usually willing to pay a bit more for it.

I am not to have a garden this year—believe it or not! We expect to make our summer home wherever we can bring the old "jalopy" to a stop. I was astounded, though, to learn that Bill Stevens had planted peas. The last half of March has seen zero weather, a complete covering of snow and lots of rain, and my garden has been wet and sloppy. I talked to a neighbor roadsider and he had not yet planted peas. He hopes to do so about April 3rd and I ventured the guess that early peas might be a good bet for him, perhaps bringing as much as \$2.00 a bushel. He came back and told me he sells his first peas from the stand at 15 cents a pound. One wouldn't have to sell very many of those to make a jingle in the pocket. Cash income early in the season counts too in meeting the weekly payroll, and people around the home table get mighty hungry for fresh green things in May and June.

"Say, Pop, can't you stop playing around here while I'm doing my homework?"—JUDGE.

NICHOLS

COPPER SULPHATE

More and more growers every year are demanding **"INSTANT"—99% Pure** because it assures all-important accuracy of copper content, dissolves quickly, covers uniformly. Easy to measure. For copper lime dust, use **MONOHYDRATED** (Full 35% Metallic Copper Content) Now packed in re-fillable, removable top drums

35. Nina C. Rickard, Sprakers, N. Y.
One lb. can Cuprocide.
36. Mrs. W. H. Riley, Sherburne, N. Y.
One lb. can Cuprocide.

THE answers to the questions in the Soil Fertility Contest varied in length from a half page to 25 pages.

In general, the length was not a determining factor in choosing the winners. Brief answers were considered satisfactory if they were complete.

The questions were answered very well. Question No. 1 on quick soil tests gave quite a bit of trouble. If you are interested in brushing up on it, you will find a complete article on it on page 6 of the February 4 issue. Some contestants mentioned quick tests for acidity, and this was allowed if quick tests for fertilizer elements were also given.

Question No. 12 on the distinguishing characteristics of the legume family also gave considerable trouble. It is true that the ability to grow root nodules which gather nitrogen from the air is a characteristic of legumes, and this was allowed by the judges

as a partial answer. However, the word legume means a pod, and a characteristic which is common to all legumes is that the seeds are formed in pods. That is evident on such crops as beans and peas, but close examination will show that clover also forms its seeds in pods as do all legumes. An unusual legume is the locust tree which bears its seeds in pods. Naturally, the greatest credit was given to those answers which were most complete.

To get a perfect mark on the question "How is 29-3 seed corn produced?" the judges felt that it was necessary to go into sufficient detail to explain the process, which many contestants failed to do.

The question "In what ways can pastures be improved?" was in many
(Continued on Page 18)

Quality so high... prices so low
make this new 1939
CHEVROLET
the biggest and best buy for you!

People have bought more Chevrolets than any other make of car during seven out of the last eight years, *because they like Chevrolet's higher quality and lower prices.* And now still higher quality and still lower prices are causing them to say, "Chevrolet's the Choice" again in 1939! Look at the smarter lines of Chevrolet's New Body by Fisher with Aero-Stream Styling. . . . Test the better all-round performance of Chevrolet's famous Valve-in-Head Engine. Experience the greater comfort and safety of

its *Perfected Knee-Action Riding System—the greater ease of operation of its †Exclusive Vacuum Gearshift. . . . Then you'll know the reasons for the overwhelming public favor for Chevrolet! Higher quality runs all through the car, yet Chevrolet prices are lower, and Chevrolet is also more economical to operate and maintain. See your nearest Chevrolet dealer and convince yourself that the new Chevrolet for 1939 is the biggest and best buy for you!

EXCLUSIVE VACUUM GEARSHIFT (*Available on all models at slight extra cost) • NEW AERO-STREAM STYLING, NEW BODIES BY FISHER • NEW LONGER RIDING-BASE • CHEVROLET'S FAMOUS VALVE-IN-HEAD SIX • PERFECTED HYDRAULIC BRAKES • NEW "OBSERVATION CAR" VISIBILITY • PERFECTED KNEE-ACTION RIDING SYSTEM with Improved Shockproof Steering (*Available on Master De Luxe models only) • TIPTOE-MATIC CLUTCH

STOP BREEDING and CALVING LOSSES

Due to Vitamin E Deficiency

Learn what ADM Wheat Germ Oil Is Doing for Other Dairy and Stockmen!

If you have shy breeders, breeders that fail to catch, if you have cows losing their calves or giving birth to dead calves, if you have bulls that are uninterested, impotent — the trouble may be that your animals have too little vitamin E. The richest source of natural vitamin E is wheat germ oil. Here's what one breeder says after feeding ADM cold pressed Wheat Germ Oil — "results in getting young heifers and older animals to conceive have been most satisfactory". Find out how Wheat Germ Oil helps correct breeding troubles due to lack of vitamin E. Mail coupon.

Dairy Cow PRICES

By H. L. COSLINE

TO GET for you a picture of dairy cow prices in the Northeast, I recently sent out quite a number of letters to dairymen and cattle associations. Here are some opinions gleaned from those letters:

The American Guernsey Cattle Club reports an average of \$209.99 for cows sold at sales during 1938. In 1937 the average was \$254.70.

R. Austin Backus of Mexico, N. Y., reports that purebred Holsteins are bringing from \$125.00 to \$200.00, and grades from \$50.00 to \$100.00.

Following are the range of prices by areas as reported by readers:

NEW ENGLAND	PUREBREDS	GRADES
Maine.....	\$100 to \$175	\$60 to \$125
Massachusetts.....	165 to 250	85 to 150
Vermont.....	100 to 150	75 to 100
NEW JERSEY.....	150 to 160	125 to 150
NEW YORK.....		
Hudson Valley.....	100 to 200	75 to 150
Mohawk Valley.....	160 to 175	100 to 125
Northern New York.....	100 to 150	75 to 100
Western New York.....	100 to 175	65 to 90
Southern New York.....	120 to 170	75 to 110

Among those who felt that the trend of cow prices was a bit up, the greatest number seemed to live in Delaware, Greene, and Orange Counties.

From the Mohawk Valley—"The dairy cow market is very dull now due to the unsettled dairy situation. Only dairymen with preferred markets are buying cows. Buyers like production records when they are available, but cows bought from a dealer never seem to have records available. Cows with a high butterfat test are desired."

"The better class of dairymen look for production records, high butterfat test and freedom from disease when buying cows. The average are more inclined to look for a cow with good looks and low price."

From Broome County, N. Y.—"Unless the milk situation becomes more settled, cow prices will go down. It is my opinion that good cows have been too high."

From Delaware County, N. Y. — "At present there is a demand for Jerseys and Guernseys because of a high butterfat requirement for Grade A milk."

From Orange County, N. Y. — "I cannot see that there has been much change in the price of cows lately. It is my experience that if you want a good cow, you have to pay a good price for her."

From Chautauqua County, N. Y.—"The unsettled milk situation has had a very depressing effect on milk prices."

From Ontario County, N. Y. — "Cow prices here are a little lower than last year. According to a report from the Ayrshire Breeders' Association, cows sold at sales last year with production records over 10,000 averaged \$280 a head. Cows with no production records or with records less than 10,000 averaged \$140 a head."

From Washington County, N. Y. — "As a result of the unsettled milk situation, I predict quite a reduction in the price of cows in the near future."

"Real dairymen are looking for cows with production and butterfat records and are paying the price. If milk drops, cow prices will go down."

"The price of cows varies with the price of milk. Last September the cow market advanced from \$25 to \$50, but at present I look for a slump in price."

From Rensselaer County, N. Y. — "More heifer calves are being raised here. Losses from disease have reduced the number of animals for sale. I would say that cattle prices for the last year are about holding their own."

From Dutchess County, N. Y. — "I would say that prices here are slightly higher than they have been, but the

(Continued on opposite page)

Dr. Naylor's MEDICATED Teat Dilators

Safe and dependable treatment for Spider Teat, Scab Teats, Cut and Bruised Teats, Obstructions.

Dr. Naylor Dilators are sterilized, medicated and saturated with the antiseptic ointment in which they are packed. They have a deep yielding surface of soft absorbent texture which fits either large or small teats without overstretching or tearing and which carries the medication INTO teat canal to seat of trouble.

The Only Soft Surface Dilators

Whether infection at end of teat, cut or bruised, the resulting condition which closes teat canal making it hard to milk is always the same — INFLAMMATION.

To relieve inflammation in a wound or bruise the treatment most universally used by the veterinary and medical profession is—to apply antiseptics, healing agents and a sterilized, soft absorbent dressing.

Dr. Naylor's Medicated Teat Dilators apply this same treatment for removing inflammation from the milk canal of cows' teats. They carry antiseptics and healing agents into teat canal to combat infection and promote healing.

The dilators themselves are sterilized, soft, absorbent dressings which protect the inflamed area, absorb inflammatory exudates and keep teat canal open in its natural shape while tissues heal.

Absorbine Brings Quick Relief

"Just before I started haying, my horse became very lame. I thought he would be useless, but thanks to Absorbine he is in the hay field, as well as ever!"

When your horse gets lame from muscular strain, use Absorbine to give him quick relief. That way you may save laying him off during your busiest time. It helps reduce swelling and pain. Use also as a body wash or leg brace. Antiseptic. Get a bottle today. At druggists, \$2.50 a bottle.

W. F. Young, Inc., Springfield, Mass.

ABSORBINE

For relief of Your Own Strains, Muscular Aches and pains, use Absorbine Jr.

milk situation will probably slow up sales. Cows with high tests have been very popular, but at present some Holstein men who have added yellow cows are losing their enthusiasm because they have lost the Grade A market."

From Jefferson County, N. Y. — "In this area, there is little demand for either cows, heifers, or calves. Most buyers are looking for something for nothing."

"Cattle dealers report that demand is at a standstill. Last fall purebreds brought from \$125 to \$150, with grades about \$25 less. That, of course, was for animals free from disease."

From New Jersey — "Sussex County, N. J., is mainly interested in making milk. There is comparatively little raising of replacements. Dairymen will pay about as much for a promising looking grade as they will for a registered purebred. Prices are not much different than they were last year. Principal breeds kept are Holsteins and Jerseys, with a few Guernseys and Brown Swiss, and a scattered number of Ayrshires."

From Vermont—"There appears to be a grade vs. purebred differential on a good fresh animal of about \$25, and a premium on Bangs free cows, particularly from certified dams, of \$30 to \$35 per cow on a good fresh animal."

By J. F. (DOC) ROBERTS

LIVESTOCK selling for large groups has peculiar angles, sometimes even expressing the state of mind of farm people. Right now, we are told, usually many times a day, "Am sure glad I got this stock in before the market broke." An expression of pessimism, almost defeatism, which just simply is not normal among farm people, and, is it justified?

In spite of the 30 or 40% increase in the marketing of cows for meat, since the adverse milk ruling, cows have not broken over about 25c a cwt., maybe in some few cases, up to 50c; bulls 25c to 50c, and milch cows, around \$10 a head. Horses are selling from \$10 to \$20 higher; calves have not suffered the usual spring slump; beef steers have not broken and the anticipated influx from Canada will not be so great, or have such a bad effect, simply because Canada has not the cattle on hand to ship in; lambs are making money for both feeder and raiser, with prospectively a very satisfactory, and higher, clip lamb market this early spring. Wool is in a much stronger position than a year ago, and is selling generally from 3c to 6c a pound higher than a year ago, and when bringing over 25c a pound, probably should be sold this year. Surely all of this does not add up to a demoralized situation.

Encouragement and real information on sheep production in the Northeast can be gained by obtaining Bulletin No. 399, published by the New York State College of Agriculture, and put out under date of January, this year, by Dr. John P. Willman. This is the most complete, the most authoritative, and the most understandable, sheep production bulletin it has ever been my pleasure to read, and I hope all the farm people interested in sheep will send for, and read this bulletin from cover to cover.

Another fine and encouraging thing is the Aberdeen-Angus sale, which will be held at the University pavilion on May 8th, under the sponsorship of the

(Continued on Page 18)

The McCormick-Deering No. 61 PROVES ITS VALUE in Tangled Grain

\$695

f.o.b. factory, complete for power-drive operation, with choice of grain tank or bagging platform. Machine complete with auxiliary engine, \$855 f.o.b. factory.

Front view of header unit with reel removed, showing the patented open-end auger and slatted chain feed carrier.

The rub-bar cylinder is especially efficient for tough grain, and seed that is hard to get out of the pod. That's why it is used in the No. 61.

• The test of a combine is its work in heavy crops, and down and tangled grain. And that's when the McCormick-Deering No. 61 proves its real worth. It cuts within 1½ inches of the ground. The patented open-end auger delivers the grain in a smooth flow to the feeder, which carries it to the cylinder—no bunching, no clogging anywhere.

The all-around efficiency of the No. 61, plus its new low price of \$695 f.o.b. factory, makes it the *best buy in a small combine* any way you look at it.

Ask the International Harvester dealer about the McCormick-Deering No. 61—the 6-foot combine that *really satisfies*. It can be bought on the Income Purchase Plan. Other sizes up to 16-foot cut.

INTERNATIONAL HARVESTER COMPANY
(INCORPORATED)
180 North Michigan Avenue Chicago, Illinois

ONLY THE McCORMICK-DEERING No. 61 GIVES YOU ALL OF THESE FEATURES IN A 6-FOOT COMBINE

- 1 Patented open-end auger.
- 2 Rub-bar cylinder. Does not chop straw. Simplifies separation and is easily adjusted.
- 3 Straight-line threshing. No right-angle turns or bottle-necks to cut capacity.
- 4 Extra-value construction.
- 5 Rotary, 3-section, all-metal straw rack.
- 6 Designed for engine operation as well as power drive.
- 7 Simple to operate and adjust.
- 8 Handles all small grains and seed crops.

NORTHEASTERN Slants ON THE National NEWS

President Gets Diluted Reorganization Bill

WHILE vacationing down in Georgia last week, President Roosevelt received and signed a bill which has had rough sledding getting through Congress—the measure known as “government reorganization bill.” Bill was originally introduced two years ago and was twice defeated. As first sent to Congress, it called for such a sweeping reorganization by President of executive branch of government that it was claimed that it would convert presidency into a dictatorship. Public opinion was aroused to such an extent that Congress was flooded with telegrams demanding defeat of the bill.

As finally passed by Congress, the bill is only a shadow of its original self. It does not permit President to establish any new executive departments or to abolish any that now exist, and it lists 21 important agencies that he cannot touch. Among these is Civil Service Commission. Also, bill requires President to submit his reorganization plans to Congress, which may veto them within 60 days.

Main things which bill permits President to do are:

1. He can appoint six new administrative assistants, at salaries of \$10,000 each, to aid him in dealing with the more than 100 executive departments and agencies.

2. He can transfer, consolidate or abolish some 60 agencies whose functions now overlap or are divided (subject to Congressional veto).

Chances for effecting savings through government reorganization (one of main goals of bill) are considered slim, due partly to fact that Congress added amendment which bars President from cutting out any of existing functions of government bureaus. Therefore no savings can be made by getting rid of useless activities.

Help for Business

“THIS is the healthiest thing that has happened in a long time,” said Senator Arthur Vandenberg of Michigan, commenting on Secretary of Treasury Morgenthau’s recommendations regarding social security tax to House Ways and Means Committee on March 24. Proposed by Secretary Morgenthau was postponement of scheduled increase in pay roll tax for old-age insurance (set to up 50% next January). “It is especially urgent,” he said, “that at this time we do not place any avoidable burdens on American productive enterprise.”

Mr. Morgenthau also said that a reserve fund of 47 billions (as provided for in social security act) is not necessary. Further, he recommended that board of trustees be appointed to handle administration of these funds, in order to meet criticism that they are now being used to pay ordinary government expenses.

The Secretary offered three optional plans covering collection of pay roll tax to 1943. One of these proposed holding tax down to 1% during next three years; the others proposed raising it by smaller percentages than law calls for. Although all three called for imposing full 3 per cent rate in 1943 or later, Mr. Morgenthau said Con-

gress would have plenty of time between now and 1943 to think this over and decide whether a higher or lower rate was permanently necessary.

President Roosevelt, commenting at a press conference on Mr. Morgenthau’s proposals, admitted that existing “full reserve” system has been rightly criticized, and said that Administration now thinks that a reserve of from 2½ to 3 billions (instead of 47 billions) would be sound.

SLANT: From January 1937 to January 1939, government collected \$996,000,000 (1% of wages collected from both employers and workers), and paid out only \$11,000,000 in death benefits and lump-sum payments to workers. Under present law, tax rate keeps on rising until government is collecting 6% of payrolls (3% each from workers and employers, in addition to a 3% tax on payrolls for unemployment insurance). Taking so much more money out of circulation than is immediately put back through old-age pension payments, etc., is declared by experts to be economically unsound and one of the present causes of business decline. Secretary Morgenthau is to be congratulated for taking the lead among Administration officials in proposing to correct this unsound system.

A Good Job

THE Dairymen’s League Cooperative Association is at the present time distributing to its members approximately \$1,500,000 on its certificates of indebtedness. About \$1,000,000 of this represents advance payment at par, plus accrued interest to May 1 on outstanding 1943 certificates of indebtedness. The balance is advance payment of May 1 interest coupons on all series of League certificates outstanding.

SLANT: This million and a half dollars, distributed to more than 700 rural communities in the New York milk shed before May 1, is a Godsend to thousands of farmers who will have this cash to use in their families and for their spring farm operations.

When the cooperative association started to issue its certificates of indebtedness for deductions years ago, enemies of the cooperative movement said that the certificates would never be paid for, and that farmers who made these loans out of their milk checks would lose the entire amount. The answer to that criticism is the fact that the certificates have always been promptly paid when they were due, and, as in this instance, often long before they were due, with full interest at 6 per cent. This remarkable financial feat has been accomplished through the worst depression America ever saw, when investors in almost every other line of business not only lost their interest but often much of their principal.

Disagreement on TVA

PROBE of Tennessee Valley Authority by joint Congressional committee came to an end last week with two contradictory reports. Majority report, signed by five Democrats and one Republican, gave TVA a clean bill of health. It asserted that rates for TVA power provide an honest yardstick for comparison with rates charged by

private utilities; that charges of dishonesty made by Dr. Arthur Morgan, former TVA chairman, were without foundation and not supported by evidence; that TVA’s personnel is able, honest and efficient; that land purchases by TVA were efficiently and honestly managed.

Minority report, signed by three Republican members of committee, charged that TVA yardstick is “not only meaningless, but worse, is misleading, deceptive, unfair and dishonest as a measure of the fairness of rates of privately-owned utilities not enjoying subsidies and advantages of which TVA may avail itself.” It declared also that TVA should have a “sweeping reorganization”, that it is guilty of “waste and inefficiency”, and has been “arbitrary, dictatorial and unbusinesslike.”

3,500,000 More Taxpayers

IN ONE of its most far-reaching decisions, Supreme Court on March 27 wiped out government employees’ immunity from taxation. Decision hits 2½ million state and municipal workers, plus a million Federal employees—all who earn more than \$2500 a year (if married) or \$1,000 (if single). These new taxpayers, it is estimated, will add 16 millions annually to Federal revenues.

Following Supreme Court decision, Senate approved a bill to same effect. By it all tax immunities enjoyed by state and federal jobholders—including judges and members of Congress—are ended. Bill, however, prohibits collecting any back taxes, and sets Jan. 1, 1939, as date from which taxes may be collected. Similar measure has been approved by House.

SLANT: One of most important effects of making salaries of government workers taxable is that in the future such persons will take more interest in cutting down Federal expenses and balancing the budget!

Next to feel the axe may be tax-exempt government securities. Elimination of their exemption has been asked by President Roosevelt and it is now thought that a new Supreme Court ruling may bring future issues of government securities within income tax law. Revenue from this source would be considerably higher than that expected from taxing government salaries.

Unfair Tax Discrimination

SPEAKING recently to 250 farmers gathered at Menands, N. Y., for annual meeting of Capital District Cooperative, W. W. Brady, chain store executive, stressed importance of standardized grading and packing, if producers are to get a larger share of consumer’s dollar. In big markets such as the fruit auction in New York City, he declared, these are the first essentials in making a sale.

Referring to fact that farm organizations from coast to coast have gone on record against proposed Patman “death sentence” tax on chains, Mr. Brady said that farmers realize that such tax proposals are a threat to their own markets and incomes. (Opposition to such discriminatory taxes has been voiced by National Grange, American Farm Bureau Federation and National Cooperative Council, as well as by more than 200 state and regional farm organizations in Northeast and throughout the country.)

“Any industry using 30 per cent of nation’s farm products,” said Mr. Brady, “has its own place in business and is necessary to welfare of the American farmer. Any industry saving

the consumer 8 to 10 per cent yearly on his food purchases is helping to build up the economic structure of the country. And any industry employing over a million persons at steady, yearly wages with no lay-offs or slack periods, should not be forced to be the goat of politicians."

SLANT: There is a place in American business for any form of business — chain, independent, or cooperative — that honestly and efficiently serves the public; and discrimination against any of these by unfair taxation is not in the interest of either producers or consumers.

Farm Credit News

Average Mortgage Interest Bill \$160
INTEREST on farm mortgages now takes smaller part of farm income than for a long time back, according to statement made last month by Governor F. F. Hill of Farm Credit Association. Figures compiled by FCA, he said, show that total farm mortgage interest bill has dropped steadily in past ten years, from 568 millions in 1928 to 372 millions in 1937, and to about 365 millions last year, with average annual interest payment for each mortgaged farm in 1937 amounting to \$160.

"Getting interest rates for agriculture as low as those available to other industrial groups has been one of major objectives of the Farm Credit Association, and that objective has been realized," said Governor Hill. Interest bill now paid by farmers on their farm mortgages, he declared, is lower than long-term interest charge paid by any

major industrial group, except railroads and public utilities.

Loans Being Repaid

For the first year since 1932, Northeastern farmers repaid more during 1938 on their Federal land bank loans than they borrowed on new mortgages, Land Bank President E. H. Thomson reported to officers of 137 national farm loan associations at recent annual conference in Springfield.

Payments on principal of 29,500 land bank mortgages were \$3,790,000, whereas new loans of 1,153 amounted to \$3,150,000. All are amortized over long periods, with semi-annual payments on principal. For nearly five years, or until middle of 1938, principal payments were not required, but many farmers kept them up voluntarily. Now all land bank loans require principal in addition to interest.

"Majority of stockholders of Springfield land bank are farmers of Northeast," President Thomson reported to National farm loan associations. During 1938, government capital of \$1,044,035 was returned to U. S. Treasury, leaving \$4,186,115 yet to be repaid. Farmers and national farm loan associations own 51% of bank's capital stock, Uncle Sam 49%.

Co-ops to Hold Annual Meeting

Announced for May 15 and 16 is conference of co-op leaders and annual stockholders' meeting of Springfield Bank for Cooperatives, Springfield, Mass. Stockholders are some 85 co-operatives of New England, New York and New Jersey, which are using Springfield bank's credit.

Program, to be announced later in detail, already includes S. D. Sanders, Co-op Bank Commissioner, Washing-

ton, D. C., and W. I. Myers, former FCA Governor.

Springfield bank recently announced reduction in interest rates on new loans to 2½% on working capital, and 1½% on loans secured by staple, salable, warehoused products. Bank's loans to buy, build, or refinance permanent facilities of co-ops remain at 4%.

Britain Takes Firm Stand

TALK about what to do to "stop Hitler" suddenly turned into action during fortnight when Britain's Prime Minister Chamberlain dropped bomb shell in European politics. Britain, he said in speech before House of Commons, would back up Poland in a big military way "in the event of any action which clearly threatened Polish independence and which the Polish government accordingly considered it vital to resist with their national forces." This came as complete surprise to world, for since Peace of Munich was signed last September it has been believed that Britain would not fight to preserve independence of any European state East of the Rhine.

In a later speech, Chamberlain extended Britain's aid to all countries that felt "anxious" about Germany's intentions. Since seizure of Czechoslovakia and Memel by Germany, other Central European States — particularly Poland and Rumania — have felt about as comfortable as little Red Riding Hood with the big bad wolf around. Before Mr. Chamberlain spoke out, German troop concentrations near Polish frontier were reported; also

German newspaper attacks on Poland, and German political pressure on Poland to get Free City of Danzig and special privileges in Polish corridor.

In offering British aid to other States, the Prime Minister said that Britain means no harm to Germany "so long as Germany will be a good neighbor," but he accused her of having broken faith and attempting to dominate world by force.

Hitler, answering Chamberlain's declarations, denounced France and Britain, said they had no right to expect him to ask their advice about such German moves as seizing of Czechoslovakia, and warned that Germany would not stand for any "encirclement" policy.

As we go to press, it is understood that a British-Polish military pact is being drawn up.

Good Books to Read

THEY WANTED TO LIVE, Cecil Roberts. The absorbing human interest of this novel makes it refreshing reading. Nightclubs in Vienna and Prague, life on the wild Hungarian plains, stirring sidelights in the recent Nazi invasion of Austria, add realism to the romance of James Brown, railway porter.—*The Macmillan Company, New York. \$2.50.*

Good Movies to See

THE HOUND OF THE BASKERVILLES. Filmed from Conan Doyle's famous Sherlock Holmes story, this production is guaranteed to give you lots of thrills. Basil Rathbone takes the part of the great detective, and the photography heightens the effect of the mystery.

Name

Address

BY L. B. SKEFFINGTON

from SKEFF'S NOTEBOOK

ED BABCOCK'S suggestion that the only way to reduce taxes is to reduce expenditures sounds like good sense to one Western New York master farmer. His local school principal telephoned to him, urging him to get busy and put "pressure" on Albany. There was danger that state aid to schools might be cut.

"I won't do it," replied the farmer. "I have decided that we cannot hope for lower taxes as long as we keep asking for more money and services. If I should communicate with Albany at all on this matter it will be to commend them for belated attempts at economy."

The master farmer is not against good schools, as he has several of his own children in school. "If we keep on asking for more and more, then who is to blame for our taxes getting so high that they are almost confiscatory," he said. He reported that the school principal was astounded at this attitude.

When Taxes Hurt

Recently there have been a number of vigorous attacks against centralization of rural schools. I have talked with a number of opponents and they tell me their opposition is based for the most part on fear of increased cost. Of course it has seemed to many persons that the opportunities for children were greatly enhanced in the larger schools. I know one town where a few persons led opposition to centralization largely on the basis of distance from the central school. The greatest distance would have been nine miles. Now the taxes in the modern central school are less than in the district which stayed out.

Apple Box Abused

I spent a day with officers and committeemen of the State Horticultural Society discussing ills and opportunities of the apple industry. I think Dr. P. J. Parrott put his finger on something. Discussing progress that had been made in merchandising West Coast fruits and vegetables, he said, "in California the big corporations seem to furnish the leadership. Here we are faced with something entirely different, numerous small units and rugged individualists."

"Some way or other we have got to find a way out. It may be through setting up a thinking and planning agency composed of the best minds in the industry."

I heard a lot of discussion about the apple box. When it came in a few

years ago it was expected to solve many problems. It was supposed to have advantages superior to the bushel basket. It had raised ends and was supposed to eliminate the bulge pack. But the bulge pack remains and the box is acquiring a reputation for bruised apples.

Are Fairs Desirable?

The Monroe County Fair and Rochester Exposition folded up leaving premiums unpaid. There is a movement on foot to arrange payment by the county of 4-H premiums. There also is considerable discussion as whether or not the fair should be revived, or whether its passing is good riddance. Present talk contemplates a two-day fair centered around 4-H and other junior groups. Personally, it has seemed to me for years that the county fair run by politicians and with a midway as its chief attraction was on the way out. Any revival should be in the way of a return to the old-time agricultural fair, with amusement features centering about local talent.

Festival Gains Prestige

Importance of the Western New York Apple Blossom Festival at Geneva May 13 is indicated by the list of distinguished guests who already have accepted invitations. These include His Excellency Carlos Martins Pereira e Sousa, Brazilian ambassador to the United States; M. L. Wilson, under-secretary of agriculture, and Major-General Thomas Holcomb, commandant of the U. S. Marine Corps.

Five colleges will participate in the program, as well as scores of schools and other units throughout nine counties. Pageantry will be on the campus of Hobart College, with episodes by Elmira, William Smith and Keuka colleges. The University of Rochester band of 70 pieces will play.

Apple By-Products

In a review of the outlook for by-products from apples, Dr. Donald K. Tressler of the Geneva Experiment Station, said he was "amazed by the possibilities for apples."

He has been active for some time in fruit juice research. One of the triumphs at the station is apple juice. Asked what is the difference between apple juice and cider, he said it is largely psychological.

"The public has become accustomed to thinking of cider as 75 per cent apple juice and 25 per cent crushed worms," Doctor Tressler said.

Canned apple juice made according to the Geneva formula uses clean apples and is pasteurized to kill micro-organisms. Some of the trouble with canned apple juice to date is that some canners have used ordinary tin cans, whereas the product requires an enameled can.

Considerable research is being done with apple flour, apple flakes and puffed apples. The flour is mixed with ordinary flour. The flake is used to sprinkle over other foods and puffed apples hold promise as a breakfast food. Considerable success also has been obtained in freezing sliced apples for bakers who want a constant supply of the same varieties the year around.

Edward Heinaman Honored

Steuben County farmers celebrated the advent of spring, paid tribute to the dairy industry, and honored one of the major breeds of cows at the Fifth Annual Dairy Banquet in Bath,

At left is Edward W. Heinaman, senior member of the Steuben County Farm Bureau Executive Committee. At right is Clair Bennett, junior member.

March 21. The guest speaker was L. W. Morley, Secretary of the American Jersey Cattle Club.

The guest of honor was Master Farmer Edward W. Heinaman, it being his 82nd birthday.

In recognition of noteworthy records, about 75 members of Dairy Herd Improvement Associations received honor roll certificates from the National Dairy Association.

Watching the Tax Dollar

Last August a group of citizens organized the Saranac Lake Taxpayers' Association, hired accountants, and asked them to study the books and records of the village of Saranac Lake. Their purpose was not to uncover any irregularities, but rather to give taxpayers a picture of what happens to the village tax dollar, with the thought that some efficiencies and economies might result.

On January 25, with the temperature 30 degrees below zero, over 450 citizens and officials met in what might be called an old-time town meeting to discuss the results.

Several recommendations came from the meeting, including an annual audit as a matter of business practice, a central purchasing system, reserves to be set up to take care of expenditures contracted for but not paid at the end of the fiscal year, that bond issues be submitted to a referendum, and that the village should make every effort to live within its budget and gradually reduce indebtedness.

There is much evidence that all citizens are becoming more tax conscious and more interested in knowing more about costs and activities of local government. This is a healthy situation.

HIGHLIGHTS OF THE FIGHT FOR A LIVING PRICE FOR MILK

FIVE-STATE MILK PRODUCERS ASSOCIATION FORMED ABOUT 1900... MEMBERS FAILED TO STICK TOGETHER IN FIRST STRIKE WHICH ENDED IN DEFEAT!

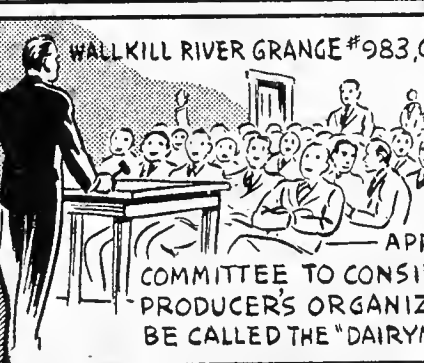

IN 1906—AN ORANGE COUNTY FARMER HAD A VISION OF A GREAT LEAGUE OF DAIRY FARMERS FIGHTING SIDE BY SIDE FOR A LIVING PRICE FOR MILK

TO MAKE THIS VISION COME TRUE THE NEW ORGANIZATION WOULD HAVE TO BE SO WIDE SPREAD THAT DEALERS COULD NOT PLAY ONE GROUP OF FARMERS AGAINST ANOTHER

NEW YORK MILKSHED

WALLKILL RIVER GRANGE #983, ORANGE COUNTY

APPOINTED A COMMITTEE TO CONSIDER A MILK PRODUCER'S ORGANIZATION TO BE CALLED THE "DAIRYMEN'S LEAGUE"

THE PLAN FOR THE "DAIRYMEN'S LEAGUE" WAS HEARTILY ENDORSED BY THE POMONA GRANGE OF ORANGE COUNTY

—ON AUGUST 25, 1907, THE DAIRYMEN'S LEAGUE WAS INCORPORATED WITH A MEMBERSHIP OF 691 DAIRY FARMERS

Dairymen's League

How the Large Dairy Companies Fared in 1938

By LELAND SPENCER

THE annual reports of most of the large corporations of the country appear in March of each year. These reports are prepared by the management and are issued mainly for the information of the stockholders. The reports issued by some companies are much more informative than others, but the real "meat" in all cases consists of the balance sheet and the income statement, or report of profit and loss. Usually there is a statement by the president of the corporation, a sort of letter of transmittal, in which he explains why the company did better or worse during the past year, what are the prospects for the year ahead, and also, perhaps, expresses himself on public policies as related to his company's business.

Leland Spencer

For the most part, the business of processing and distributing milk is organized in small units that are run as individual enterprises, partnerships, or small corporations. However, there are several good-sized dairy corporations, and the two largest rank among the giants of the industrial world. I refer, of course, to The Borden Company and National Dairy Products Corporation. The annual reports of these concerns are of interest to the general public, and more especially to dairymen who supply them with milk. The reports of these companies are fully as informative as the average corporation reports, yet they do not go into much detail.

There are two facts that we need to keep firmly in mind as we consider the results of operations by Borden and National Dairy as revealed in their annual reports. In the first place, both companies do a nation-wide business, and, in fact, do a considerable volume in other countries. The reports therefore give no direct information concerning the purchases, sales, or profits in the New York milk shed or any other locality. The other fact is that the business of both Borden and National Dairy is diversified—they handle all kinds of dairy products, and some sidelines such as eggs and mayonnaise. For this reason, also, we are unable to judge from the annual reports how

much profit or loss the companies made on fluid milk.

Now, of the facts that are shown in the Borden and National Dairy reports, probably the most important, both to the stockholders and to the general public, is the amount of profit made in 1938. The profits of both companies totaled 18 million dollars, compared with 16.6 million dollars the previous year. This moderate increase in profits is rather striking in comparison with the experience of most businesses last year, which was one of substantially smaller profits. However, those persons who may have held stock in either of the large dairy companies for a number of years will not become enthusiastic over last year's results. The total profits of Borden and National Dairy were only 37 per cent as much in 1938 as in 1930.

Last year the profits of the two companies amounted to 3.3 cents of each dollar of sales, compared with 2.8 cents in 1937 and 6.6 cents in 1930. The rate of profit on the capital supplied by the stockholders was 8.8 per cent in 1938, compared with 8.2 per cent in 1937. That is a fairly satisfactory return on the stockholders' capital, considering present low rates of interest, and the risk involved in this kind of business as compared with ultra-safe investments.

It will be of interest to compare the profits of Borden and National Dairy with those of two much smaller corporations whose business is mainly in evaporated milk. These companies are the Pet Milk Company and the Carnation Company. The profits of these concerns in 1938 amounted to 3.5 cents on each dollar of sales, a slightly higher rate than for Borden and National Dairy. More striking is the fact that the smaller companies' profits in 1938 were one-third larger than in 1930, while the large companies' profits were greatly reduced. Evidently in the past several years the evaporated milk business has been much more profitable than the fluid milk business. Following is a quotation from the Borden report: "The Fluid Milk Division as a whole enjoyed a more prosperous year than in 1937, although again the Company was unable to secure a satisfactory return on the sale of fluid milk."

The Borden report gives special attention to "Public Relations" and "Employee Relations." The report itself is addressed to both stockholders and em-

ployees. An innovation in the National Dairy report is a series of charts showing the importance of different products in the sales dollar, the trends in volume and price of the principal commodities sold, and the relative amounts expended for raw materials, wages, and other items.

Apple Exports Up

On March 1 cold storage holdings of apples were reported at 15,008,000 bushels, which was about 4½ million bushels (about 23 per cent) less than last year and about 26,000 bushels under the five-year average. Reductions of storage holdings during February were not quite as heavy as they were a year ago. New York's holdings were about 1 million bushels less than a year ago, New Jersey's about 60,000 bushels less, and Pennsylvania's about 300,000 bushels less.

Exports from July through January of this year totaled 8,600,000 bushels, compared with 6,900,000 bushels for the same period a year ago. This is unusual because apple exports usually vary directly with the size of the crop.

Potatoes Up Slightly

"The Vegetable Situation, March 29," a mimeographed publication of the U. S. Dept. of Agriculture, states that potato prices for both old and new stocks have risen slightly in recent weeks.

This report gives the Presque Isle, Maine, price of March 18 as \$1.08, as compared to \$.95 on February 25. Reports from Maine state that potato growers are optimistic about better prices and are in no hurry to sell.
